H. Loiseau and E. Szechenyi *In its* La Rech. Aerospatiale, Bi-monthly Bull. No. 1981-6, Nov.-Dec. 1981 (ESA-TT-741) Mar. 1982 p 47-59 refs Transl. by ONERA into ENGLISH from 'La Rech. Aerospatiale, Bull. Bimestriel (Paris) No. 1981-6, Nov.-Dec. 1981'

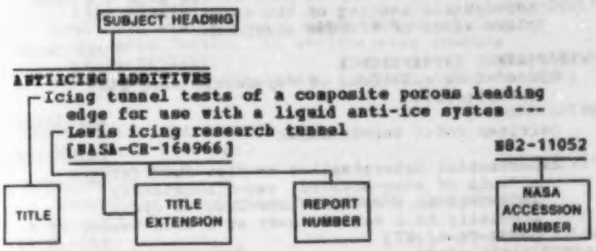
Avail: NTIS HC A04/MF A01; original report in FRENCH available at ONERA, Paris FF 55

The aeroelasticity of turbomachine blades, of cascade wind tunnel and performance tests, were analyzed. Wind tunnel tests involved excitation by hydraulic actuators and pressure transducer measurements. It is found that unsteady pressures causing stall flutter are located on the upper surface, principally in the operating domains where flow is completely separated, while instability is principally a function of the angle of attack. The phase lag of unsteady pressures increases with vibration frequency. When it is sufficiently large, the flutter disappears, even under suitable separation conditions. Unsteady lift and moment, induced by a vibratory pitching movement around any axis are obtained by linear superposition of forces due to heaving and a pitching movement around a given reference axis. The wind tunnel simulated closely compressor flows with good periodicities in five interblade channels. Author (ESA)

SUBJECT INDEX

AERONAUTICAL ENGINEERING / *A Continuing Bibliography (Suppl. 152)* SEPTEMBER 1982

Typical Subject Index Listing



SUBJECT HEADING
ANTIICING ADDITIVES
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164966]
N82-11052
TITLE
TITLE EXTENSION
REPORT NUMBER
NASA ACCESSION NUMBER

The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by hyphens. The NASA or AIAA accession number is included in each entry to assist the user in locating the abstract in the abstract section of this supplement. If applicable, a report number is also included as an aid in identifying the document.

A

A-300 AIRCRAFT
Sideslip indication system as a fuel saving aid in jet transport aircraft operation --- a-300 and a-310 aircraft N82-25181

ABRASION
Chem-Braze abradable seal attachment to aircraft gas turbine compressor components [AD-A111692] N82-25521

ABSORPTION SPECTRA
In situ ozone data for comparison with laser absorption remote sensor: 1980 PEPE/NEROS program [NASA-TM-84471] N82-25661

ACCELERATION (PHYSICS)
Statistical review of counting accelerometer data for Navy and Marine fleet aircraft from 1 January 1962 to 30 June 1981 [AD-A110660] N82-25243

ACOUSTIC DUCTS
Development of an analytical technique for the optimization of jet engine and duct acoustic liners [NASA-CR-169002] N82-25256

ACTIVE CONTROL
Development of a control law for the alleviation of maneuver loads on an elastic aircraft A82-34144
A method for determining the aeroelastic behavior of aircraft with active control systems [ESA-TT-719] N82-24211
Guidance and control/ACEE [NASA-FACTS-95/8-81] N82-25261

ACTUATORS
Hydraulic actuator mechanism to control aircraft spoiler movements through dual input commands [NASA-CASE-LAR-12412-1] N82-24205
Eigenspace techniques for active flutter suppression [NASA-CR-168931] N82-24206

ADAPTIVE CONTROL
A multifrequency adaptive radar for detection and identification of objects - Results on preliminary experiments on aircraft against a sea-clutter background A82-32979
Outline of a multiple-access communication network based on adaptive arrays A82-34607

AERIAL RECONNAISSANCE
Cloud top remote sensing by airborne lidar A82-32920
Airborne gamma-ray spectrometer and magnetometer survey. Ikpikpuk River quadrangle, Alaska, volume 2 [DE82-000314] N82-24620
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 1 [DE82-004150] N82-24629
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 2 [DE82-004169] N82-24630
Airborne gamma-ray spectrometer and magnetometer survey. Barrow quadranagle, Alaska, volume 2 [DE82-000342] N82-25623

AEROACOUSTICS
Model based study of various configurations of jet crossing a cavity - Application to the CEPRA 19 wind tunnel of CEPr A82-33627

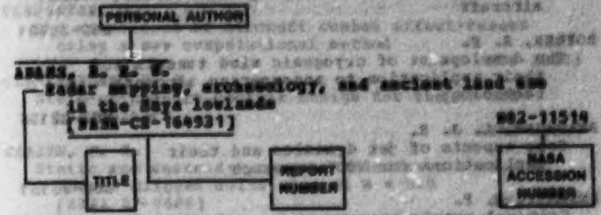
PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

June 7-11, 1982, AIAA Paper 82-0935. 14 p. 23 refs. Research supported by the Nederlands Instituut voor Vliegtuigontwikkeling en Ruimtevaart.

A computer program system used for the prediction of aircraft steady aerodynamic characteristics is presented for simulating body and fillet effects in a wing-alone code. The computational aerodynamic information system XFLO22NLR contains a geometry processor, a modified transonic flow analysis code FLO22, simulating body influence, the subsonic Panel method, the three-dimensional laminar-turbulent boundary layer code BOLA, and the post-processing system EDIPAS. The system can predict gross values of lift, pitching moment and drag of wing-body configurations, and can provide information with respect to individual drag components, pressure distributions and boundary layer quantities. Capabilities of the system are demonstrated for various transport-type wing-body configurations. D.L.G.

A82-31923 # **The equivalent simple body /ESB/ method for transonic wing analysis.** P. J. O. Neil and A. Verhoff (McDonnell Aircraft Co., St. Louis, MO). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0936.* 12 p. 10 refs. Research supported by the McDonnell Douglas Independent Research and Development Program.

A procedure is presented for generating an Equivalent Simple Body (ESB) which simulates the wing/fuselage interaction of a complex fighter-type fuselage. The method is used in conjunction with state-of-the-art transonic, potential flow codes, which are limited in their ability to generate computational grids about complex fuselage geometries. The ESB representation is determined at a subcritical Mach number using the precise geometric modelling capabilities of a panel method. Mach number independence of the interaction is established for small angles of attack, thus allowing for accurate computation of wing pressures with the transonic codes. Results are shown for F-15, F/A-18, and AV-8B geometries. (Author)

A82-31932 # **A high-frequency transonic small disturbance code for unsteady flows in a cascade.** G. D. Kerlick and D. Nixon (Nielsen Engineering and Research, Inc., Mountain View, CA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0955.* 8 p. 10 refs. Contract No. N00019-81-0169.

A high-frequency version of the Ballhaus-Goorjian (1977) code LTRAN2 has been adapted to represent unsteady aerodynamic phenomena in transonic cascade flow. The modifications to the algorithm for high frequencies differ from those of Rizzetta and Chin (1979) in two ways: first, a second-order difference for the velocity potential term instead of a first order one is used, and second, a wake condition derived for the transonic small disturbance equation is applied. Then, in order to represent the cascade geometry, periodic boundary conditions and periodic tridiagonal solvers must be introduced. Examples of both oscillatory flows and indicial responses are presented. Application of the indicial method to unsteady cascades is discussed. Future work on the code will extend the applicability of the code to staggered, highly cambered cascades. (Author)

A82-31933 * # **Finite volume calculation of three-dimensional potential flow around a propeller.** W.-H. Jou (Flow Industries, Inc., Kent, WA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0957.* 7 p. 10 refs. Contract No. NAS3-22148.

The finite volume scheme of Jameson (1977) is used to calculate potential flow around a propeller rotating at high speed. An H-type mesh is generated and used successfully in the calculations. A test calculation with a thick blade cross section shows that the present code is capable of computing the propeller flow at the advance Mach number 0.8. The possible physical mechanisms which may play an important role in the propeller aerodynamics are discussed. V.L.

A82-31934 # **Calculation of the flow-field velocities of a wing-body-stores combination in transonic flow.** S. N. Chaudhuri, C. Balasubramanyan (Tennessee, University, Tullahoma, TN), and P. Sundaram. *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0958.* 7 p. 12 refs. Contract No. F08635-80-C-0088.

An integral equation method developed by Oswatitsch et al (1950, 1955) is extended to calculate the flow-field perturbation velocity components for various wing-body-pylon-external store configurations in the lateral and transverse directions. The computed flow field velocities are found to be in reasonably good agreement with pressure probe and laser Doppler velocimetry data at different Mach numbers and angles of attack for regions where strong viscous effects are absent. The method can be further extended to more complicated geometries such as multiple stores and engine intakes at both subsonic and supersonic free-stream Mach numbers. V.L.

A82-31935 * # **Evaluation of two analytical methods for the prediction of inlet flow fields in the vicinity of generalized forebodies.** S. F. Yaros (NASA, Langley Research Center, Transonic Aerodynamics Div., Hampton, VA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0959.* 11 p. 16 refs.

An investigation of the capability of two computer programs to simulate transonic and supersonic flows about representative fighter aircraft forebodies has been carried out for purpose of predicting flow fields in the vicinity of typical inlet locations. Each computer program is described as to its features and usage, and results are compared with comprehensive wind tunnel data. Although both computer codes were inviscid, results show that the gross aerodynamic effects of the forebody, with and without a wing, can be simulated fairly well. Further work is needed to include the effects of viscosity including vortex shedding. (Author)

A82-31944 # **Hypersonic interactions with surface mass transfer. I - Steady flow over a slender wedge wing.** R. N. Gupta, N. K. Varghese (M.A. College of Engineering, Kerala, India), C. M. Rodkiewicz (Alberta, University, Edmonton, Canada), and A. C. Jain (Indian Institute of Technology, Kanpur, India). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0979.* 30 p. 32 refs.

The steady hypersonic interaction problem with air, argon, and helium injection is analyzed. A complete solution has been obtained for the basically nonsimilar problem of a slender wedge wing at an angle of attack. In the analysis presented here, a series solution has been developed to specify the initial condition close to the leading edge and the numerical integration is carried out downstream of this line for all the regions from strong to weak interactions including the transition. The numerical solutions have been obtained by the 'difference-differential' technique as well as by a finite-difference method. The comparative advantages and disadvantages of the two methods are discussed. The obtained results include the lift and drag coefficients, the lift to drag ratio, the position of the aerodynamic center, and the heat transfer rate per unit width of the wedge wing. A lighter gas like helium may be less appealing as a coolant due to the large induced pressures. (Author)

A82-31954 * # **Subsonic 3-D surface panel method for rapid analysis of multiple geometry perturbations.** D. R. Bristow, J. D. Hawk (McDonnell Aircraft Co., St. Louis, MO), and J. L. Thomas (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0993.* 12 p. 12 refs.

For any baseline aircraft configuration, a matrix of partial derivatives of surface velocity potential with respect to geometry coordinates is calculated. Linear extrapolation is then used to analyze the subcritical potential flow corresponding to a series of arbitrary small geometry perturbations. Each perturbation analysis is more than an order of magnitude more efficient than a conventional panel method solution because no influence coefficients are calculated and no large system of linear algebraic equations is solved. Wing and wing-fuselage examples are presented to demonstrate that the predicted pressure distributions are nearly exact for large changes to wing camber, thickness, and leading edge radius. (Author)

A82-31957 # **Calculations of viscous transonic flow over aerofoils.** Z. B. Chen and P. Bradshaw (Imperial College of Science and Technology, London, England). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0997.* 7 p. 9 refs.

A simple and economic iterative scheme is presented for calculating compressible viscous boundary layers and wakes over aerofoils, and for matching the shear layer calculations to the calculations of the transonic potential external flows. The iterative scheme is an extension and improvement of the scheme developed by Mahgoub and Bradshaw for calculating incompressible flow. A new iterative method in the shear layer calculations has been designed and applied in the near wake region. The computing time is only a little greater than in conventional displacement-surface calculations that ignore normal pressure gradients and consequently incur errors in the near wake. Some comparisons are made with full Navier-Stokes solutions and experimental data. (Author)

A82-31958 # **A numerical study of the turbulent flow past an isolated airfoil with trailing edge separation.** C. M. Rhie (Ford Motor Co., Detroit Diesel Allison Div., Indianapolis, IN) and W. L. Chow (Illinois, University, Urbana, IL). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0998.* 12 p. 20 refs. Grant No. DAAG29-79-C-184.

A finite volume numerical method is presented for the solution of the two-dimensional, incompressible, steady Navier-Stokes equations in general curvilinear coordinates. This method is applied to the turbulent flows over isolated airfoils with and without trailing edge separation. The standard K-epsilon model is utilized to describe Reynolds stresses. Body-fitted coordinates are generated for the computation. The solution method is an extension of the procedure developed by Gosman and Pun (1973). The performance of the K-epsilon model is assessed by comparing the predictions with the available experimental data. (Author)

A82-31960 * # **Numerical investigation of supersonic base flow with parallel injection.** G. A. Sullins (Johns Hopkins University, Applied Physics Laboratory, Laurel, MD), J. D. Anderson, Jr. (Maryland, University, College Park, MD), and J. P. Drummond (NASA, Langley Research Center, Computational Methods Branch, Hampton, VA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-1001.* 10 p. 11 refs. Research supported by the University of Maryland; Grant No. NCC1-41.

The present investigation represents the first detailed numerical calculations of base flow with gas injection using a geometry and primary flow condition germane to a scramjet combustor. The investigation is concerned with the numerical solution of the complete two-dimensional Navier-Stokes equations for the flowfield in the vicinity of the base with parallel gas injection, taking into account the fluid dynamic aspects of this flowfield. The flow is dominated by separation, and by mixed regions of locally subsonic and supersonic flow. A comparison is conducted of flows with and without injection, and the effect of base injection on the wave patterns and shear layers of such flows is clearly established. G.R.

A82-31965 * # **Three dimensional turbulent boundary layer development on a fan rotor blade.** B. Lakshminarayana, C. Hah, and T. R. Govindan (Pennsylvania State University, University Park, PA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-1007.* 10 p. 12 refs. Grant No. NsG-3266.

This paper is concerned with an experimental study undertaken to measure the boundary layer growth on a fan rotor blade. The measurements were carried out using a miniature 'X' configuration hot wire probe at various chordwise and radial locations on both surfaces of the blade. The streamwise and radial velocity profiles as well as the corresponding intensity components are interpreted and correlated. The validity of conventional velocity profiles such as the 'law of the wall' for the streamwise profile and the hodograph plot for the cross flow profile are examined. The measured values of boundary-layer gross properties are compared with the predictions based on a momentum-integral technique. (Author)

A82-31972 # **Design of finite element grids for the computation of the three-dimensional transonic flow around a wing.** A. Ecer, E. Citipitioglu, and B. A. Bhutta (Purdue University, Indianapolis, IN). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-1019.* 11 p. 14 refs. Grant No. AF-AFOSR-80-0258.

The solution of the three-dimensional, transonic, potential flow equations using the finite element method is presented for the case of flow around a wing. Numerical results obtained for different computational grids are compared for studying the efficiency and accuracy of the solution as related to the choice of the computational grid. A finite element mesh generation scheme is presented which was developed for designing proper computational grids for the solution of transonic flows around three-dimensional bodies with complex geometries. The utilization of higher-order elements and their implementation in this new mesh generation technique is discussed. Also, the application of a new iterative, element based finite element solver for transonic flows is introduced. (Author)

A82-31974 * # **Prediction of separated asymmetric trailing-edge flows at transonic Mach numbers.** C. C. Horstman (NASA, Ames Research Center, Experimental Fluid Dynamics Branch, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-1021.* 13 p. 17 refs.

Numerical simulations of the time-dependent, Reynolds averaged, Navier-Stokes equations, employing various eddy viscosity turbulence models, are presented and compared with measurements from an investigation of a transonic trailing-edge flow at a high Reynolds number. Comparisons are made for mean surface quantities as well as mean and fluctuating flow-field quantities. Solutions employing two-equation turbulence models correctly predict all the major features of the flow field. Viscous-inviscid interaction effects were found to be extremely important for predicting this flow field and equally important to the turbulence modeling employed. (Author)

A82-31978 # **A vortex sheet method for calculating separated two-dimensional flows at high Reynolds number.** M. Ribaut (Brown Boveri et Cie. AG, Baden, Switzerland). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-1030.* 9 p. 12 refs.

A mixed boundary condition problem for the time-averaged separated flow of a compressible and viscous fluid at high Reynolds number is formulated and solved by means of vortex and source integral equations. Application of the method to the flows past a flat plate and a blunt-trailing-edge section has shown that the extension and underpressure of the calculated wakes directly depend on the amount of vorticity diffusion and dissipation occurring in the flow. Computed velocity distributions and wake underpressures are compared with the experiment. (Author)

A82-31979 # **Very large aircraft - A common response to a rapidly changing global environment.** C. Dornier, Jr. (Dornier GmbH, Friedrichshafen, West Germany). *American Institute of Aeronautics and Astronautics, International Very Large Vehicles Conference, 2nd, Washington, DC, May 17, 18, 1982, Paper 82-0799.* 6 p.

out for an isolated V-shaped delta wing of negligible thickness in terms of slender body theory, which allowed the three-dimensional problem of detached flow to be reduced to the unsteady two-dimensional problem of detached flow around a widening V-shaped plate. Lift coefficients derived from the calculations and from pressure measurements show a maximum at negative dihedral angles, indicating that the parachute effect is a consequence of nonlinear effects arising from flow separation from the lateral edges of the wing. A.L.W.

A82-34144 † Development of a control law for the alleviation of maneuver loads on an elastic aircraft (Postroenie zakona upravleniia dlia snizheniia manevrennykh nagruzok na uprugom samolete). F. Z. Ishmuratov and V. N. Popovskii. *TsAGI, Uchenye Zapiski,* vol. 12, no. 4, 1981, p. 156-161. 5 refs. In Russian.

A mathematical model for the longitudinal maneuver of an elastic aircraft is used to develop an active control system for the reduction of maneuver loads. This rather general model makes it possible to investigate the interaction of the active control system with the motion of the aircraft (as a rigid body) and with elastic deformations of the structure under large disturbances. As an example, this approach is used to investigate the longitudinal maneuver of a heavy passenger aircraft with swept wings of large aspect ratio. B.J.

A82-34145 † Structural optimization of a swept wing on the basis of the aileron efficiency condition (Optimizatsiia konstruktsii strelovidnogo kryla iz usloviia effektivnosti eleronov). V. I. Biriuk, A. V. Sharaniuk, and Iu. F. Iaremchuk. *TsAGI, Uchenye Zapiski,* vol. 12, no. 4, 1981, p. 162-166. 5 refs. In Russian.

The paper considers the maximization of the aileron efficiency of a swept wing of large aspect ratio and specified weight by means of the optimization of the distribution of stiffness characteristics. The wing is modeled as a beam, and constraints imposed on the stiffness characteristics are taken into account. It is shown that an increase of approximately 20% can be obtained in the aileron efficiency by optimization of the stiffness distribution (the initial weight being preserved). B.J.

A82-34149 † An experimental study at free-stream Mach 5 of the aerodynamic heating of the upper surface of plane wings of various planforms (Eksperimental'noe issledovanie pri chisle M sub infinity 5 aerodinamicheskogo nagrevaniia verkhnei poverkhnosti ploskikh kryl'ev razlichnoi formy v plane). N. A. Kovaleva and A. Ia. Iushin. *TsAGI, Uchenye Zapiski,* vol. 12, no. 5, 1981, p. 23-32. 14 refs. In Russian.

Heat transfer at the upper surface of the wing has been investigated for plane wings of seven different planforms at a free-stream Mach number of 5, with angles of attack varying from 0 to 15 degrees. A Reynolds number of (1.7-2.5) x 10 to the 6th has been computed from incoming free-stream flow parameters and the model length. Heat transfer at the upper wing surface is found to be strongly dependent on the shape of the wing leading edge. V.L.

A82-34154 † Determination of the glide path of an aircraft with power off (Opredelenie oblasti dostizhimosti letatel'nogo apparata bez tiagi). G. V. Parysheva, S. A. Smirnov, and V. A. Iaroshevskii. *TsAGI, Uchenye Zapiski,* vol. 12, no. 5, 1981, p. 72-83. In Russian.

The glide path of an aircraft controlled by varying the angle of roll is analyzed in terms of a quasi-stationary gliding hypothesis. The Pontryagin maximum principle is used to determine the angle-of-roll control structure at trajectories corresponding to the glide path boundaries, and a classification of such trajectories is proposed. Glide paths are plotted for an aircraft as a function of its maneuvering capabilities, i.e., the available distance and the available angle of turn. V.L.

A82-34157 † Hysteresis of the normal force of a wing of complex planform under unsteady motion (Gisterezis normal'noi sily kryla slozhnoi formy v plane pri neustanovivshemsia dvizhenii). A. N. Zhuk, A. I. Kur'ianov, and G. I. Stoliarov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 5, 1981, p. 113-118. In Russian.

The effect of unsteady motion on the normal force of an aircraft having a wing of complex planform has been investigated at subsonic velocities. It is found that noticeable transformation of aerodynamic characteristics occurs, in relation to angles of attack, at separation regimes in the case of unsteady motion. It is also found that the hysteresis loop in the normal force vs angle of attack relationship widens with the angular frequency of oscillations. This effect is attributed to transformations in the unstable vortex structure of flows at large angles of attack and to the irreversibility of viscous separated flows. V.L.

A82-34161 † An algorithm for calculating the compliance matrices of aircraft structures by the substructure method as applied to aeroelasticity problems (Algoritm rascheta matrits podatlivosti konstruktsii letatel'nykh apparatov metodom podkonstruktsii primenitel'no k zadacham aerouprugosti). D. D. Evseev and A. A. Rybakov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 5, 1981, p. 139-142. In Russian.

An algorithm based on a polynomial method is proposed for determining the compliance matrices of aircraft structures. An aircraft is represented as a set of flexible substructures (wing, fuselage, controls, and suspensions) with independent sets of coordinate functions used for specifying substructure deformations. Coupling between the substructures is realized by means of discrete springs simulating actual connections between structural elements. V.L.

A82-34162 † Method for the measurement of elastic deformations of aircraft models in a wind tunnel (Sposob izmereniia uprugikh deformatsii modeli samoleta v aerodinamicheskoi trube). M. V. Ushakov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 5, 1981, p. 143-147. 8 refs. In Russian.

The measurement of the surface deformations of an aircraft model in a wind tunnel flow by a remote optical method is presented. A series of mirrors was attached flush with the wing and elevon surfaces of the model at 59 separate points, and illuminated with laser light which was subsequently reflected onto a screen. Chordwise and spanwise deformations were calculated from the differences of the positions of reflected spots for the situations of deflected and nondeflected control surfaces at an angle of attack of zero and Mach number of 2. Experimental measurements of the angle of deformation are observed to be in good agreement with those calculated from piston theory, supporting the applicability of the optical method in similar experiments. A.L.W.

A82-34163 † Instability effects on pylon and engine loading in an aircraft with high-aspect-ratio wings (Vliianie nestatsionarnosti na nagruzhenie pilonov i dvigatelei samoleta s krylom bol'shogo udlineniia). G. I. Turchannikov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 5, 1981, p. 148-152. In Russian.

Consideration is given to the problem of the dynamic loading of the pylons and engines of an aircraft with high-aspect-ratio wings flying in the turbulent atmosphere. In contrast to previous analyses based on a quasi-steady approach to the determination of the aerodynamic forces acting on an elastically deforming aircraft flying in the downwash field of a harmonic gust, the present analysis takes into account the unsteady variations in aerodynamic forces. Results of calculations of dynamic loading are presented for a heavy transport aircraft with two engines under each wing flying at an altitude of 6 km at Mach 0.77 with normal loading. It is noted that the present method results in the reduction of calculated pylon loadings to a level acceptable for maintaining static stability. A.L.W.

A82-34166 † Transonic flow past bodies of the type wing-fuselage with allowance for boundary effects (Transzvukovoe obtekanie tel tipa krylo-fiuzeliazh s uchetom vliianiia granits potoka). I. V. Tret'iakova and A. S. Fonarev. *TsAGI, Uchenye Zapiski,* vol. 12, no. 6, 1981, p. 9-15. 8 refs. In Russian.

Transonic flow past bodies of the type wing-fuselage is analyzed in the case of unbounded flow and in the case of gas flow inside a cylindrical wind tunnel with permeable boundaries. A numerical analysis is used to determine the effect of the walls of the wind tunnel test section on flow past the model. It is shown that the effect of the walls on flow past the model can be significantly reduced by adjusting pressure in the wind tunnel external chamber. V.L.

A82-34172 † Solution of creep problems by a finite element method (Reshenie zadach polzuchesti metodom konechnykh elementov). G. N. Zamula and V. A. Pavlov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 6, 1981, p. 87-97. 5 refs. In Russian.

A method and a computation algorithm based on the use of finite elements are used to analyze the stress-strain state of thin-walled aircraft structures. The method and the algorithm, implemented in a computer program, are tested on several problems including a problem concerning thermal relaxation in a stiffened plate which has exact (viscoelasticity case) and numerical (nonlinear creep) solutions. In both cases, the results obtained are in good agreement with those reported by other workers. V.L.

A82-34177 † A method of accounting for the effect of aircraft deformations on its loading (Metod ucheta vliianiia deformatsii samoleta na ego nagruzhenie). V. Ia. Mitrushchenkov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 6, 1981, p. 124-130. 5 refs. In Russian.

A method is proposed for solving static aeroelasticity problems whereby structure deformation is expanded in terms of deformation forms obtained by the method of successive approximations. The convergence of the method is analyzed with reference to a problem concerning the loading and stress-strain state of an aircraft structure with allowance for the effect of deformations on aerodynamic force distribution. Numerical results are presented. V.L.

A82-34359 * Linear decentralized systems with special structure. C. F. Martin (Case Western Reserve University, Cleveland, OH). *International Journal of Control,* vol. 35, Feb. 1982, p. 291-308. 5 refs. Grants No. NsG-2384; No. NAG2-82; Contracts No. N00014-80-C-0199; No. DE-AC01-80RA-5256.

Certain fundamental structures associated with linear systems having internal symmetries are outlined. It is shown that the theory of finite-dimensional algebras and their representations are closely related to such systems. It is also demonstrated that certain problems in the decentralized control of symmetric systems are equivalent to long-standing problems of linear systems theory. Even though the structure imposed arose in considering the problems of twin-lift helicopters, any large system composed of several identical intercoupled control systems can be modeled by a linear system that satisfies the constraints imposed. Internal symmetry can be exploited to yield new system-theoretic invariants and a better understanding of the way in which the underlying structure affects overall system performance. C.R.

A82-34373 # Electro-hydraulic nose wheel steering of the Dornier 228. *Dornier-Post* (English Edition), no. 2, 1982, p. 60, 61.

The construction, control, and electronics for the electrohydraulic nose wheel steering of the Dornier 228 aircraft are described. The pilot steers with pressure on the pedal, which changes the rudder position at the same time. The alteration of pedal position initiates voltage signals from a command potentiometer, signals which move into a servo-channel and a monitor channel. Actual nose wheel deflections are recorded by a feedback sensor for comparison between input and output signals. Steering is limited to 18 deg/sec with maximum deflection set at 45 deg either way during taxiing, 8 deg during take-off, and 0 deg during take-off and landing. An error threshold is included in the control logic, resulting in steering actuator deactivation if the difference between command and feedback signals exceeds the specified level. M.S.K.

A82-34374 # OLGA - A gust alleviation for general aviation aircraft. H. B]hret. *Dornier-Post* (English Edition), no. 2, 1982, p. 62-64.

Open-loop gust alleviation (OLGA) is described as a method of avoiding the 0.3 Hz gust induced vibrations which are associated with the maximum occurrences of airsickness, particularly in low-flying, short haul aircraft. Closed-loop systems measure the magnitude of response to gusts and change control surface configurations to compensate. This is noted to cause sluggish response to pilot commands by altering the flight characteristics. In the new technology wing program, symmetrical aileron deflection and horizontal stabilizer changes are actuated from signals generated by a digital control unit which senses the gust angle of attack, then commands compensatory action. The pilot has complete override control. Block diagrams are provided of the control circuitry, and it is shown that OLGA can produce approximately 75% gust alleviation in the ranges 0.3-0.9 Hz. M.S.K.

A82-34397 On the torsional modes of a uniformly tapered solid wing. E. H. Mansfield (Royal Aircraft Establishment, Farnborough, Hants., England). *Aeronautical Quarterly*, vol. 33, May 1982, p. 154-173.

An exact analysis is first given, within the spirit of elementary theory, of the torsional modes of a uniformly tapered solid wing whose section shape - as distinct from size - is constant. Numerical results are presented for the first five torsional modes for various values of tip chord/root chord. It is shown that the frequencies are fairly insensitive to the magnitude of the taper, and a corollary to this, which is also investigated, is that an analysis based on a partially stepped representation of the taper yields close estimates of the frequencies but can yield massive differences in the higher mode shapes. An analysis is also made of warping restraint and distributed inertia effects. (Author)

A82-34398 Turbulent boundary-layer development on a two-dimensional aerofoil with supercritical flow at low Reynolds number. C. J. Baker and L. C. Squire (Cambridge University, Cambridge, England). *Aeronautical Quarterly*, vol. 33, May 1982, p. 174-198. 15 refs. Research supported by Rolls-Royce, Ltd.

Measurements of boundary-layer development on a small two-dimensional airfoil at turbomachinery scale Reynolds numbers with turbomachinery-type pressure distributions, supercritical flow and a weak shock front are presented in addition to measurements on the tunnel side wall opposite the airfoil surface. Three boundary-layer calculation methods are considered, and none are regarded as adequate for predicting all regions of boundary-layer development on both the airfoil surface and tunnel. The lag-entrainment method of Green et al. (1973) however, is satisfactory for most purposes on the airfoil. Experimental results are compared with those results from several calculation methods. D.L.G.

A82-34464 † Automation of the synthesis of control in a stationary linear system (Avtomatizatsiia sinteza upravleniia v statsionarnoi lineinoi sisteme). V. L. Zagaichuk. *Priborostroenie*, vol. 25, Apr. 1982, p. 21-24. 5 refs. In Russian.

A method for determining the feedback law for the accuracy optimization of a stationary linear system is presented. A block-diagram for the digital-computer calculation of the parameters of the corresponding optimal controller is presented, and application to a particular case of aircraft flight control is considered as an example. B.J.

A82-34486 Unistructure - A new concept for light weight integrally stiffened skin structure. D. J. Brimm (Chem-Tronics, Inc., El Cajon, CA). *Aircraft Engineering*, vol. 54, Apr. 1982, p. 2-6.

Unistructure is a new concept for lightweight integral rib-reinforced skin structures that is readily adaptable to many configurations. The rib cross sections are a form of I beam. The rib reinforcing patterns considered here are isogrid and waffle, (i.e. triangular and rectangular constructions) but any desirable form can be produced. This paper provides an over-view of the methods of fabrication and the structural performance features of Unistructure. Comparisons are made with honeycomb, skin/stringer, and integral-machined structures. These comparisons indicate that the combined ease-of-fabrication and performance advantages of Unistructure warrant its consideration in many applications. (Author)

A82-34491 # Trends in structural analysis at ONERA (Tendances actuelles en calcul des structures à l'ONERA). R. Valid (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Journées sur les Tendances Actuelles en Calcul de Structures, 2nd, Sophia-Antipolis, Alpes-Maritimes, France, Feb. 1-3, 1982.) ONERA, TP* no. 1982-2, 1982. 46 p. 100 refs. In French.

Research directions for modeling phenomena of structural interactions, fluid-structure interactions, the behavior of composite structures, and in aerospace structures are discussed. Increasingly precise predictions are necessary for successful numerical simulation of stress cracking, impact damage, wing-flow interactions, elastoacoustic resonance, aeroelastic optimization, hydroelasticity, the elimination of the pogo effect, elasto-capillarity in orbiting spacecraft, trajectory deformation, the homogeneity of stiffened structures, etc. Analytical tools in the process of development comprise applications of variational principles and their coupling in static and dynamic situations, finite element modeling of multilayered composites under displacement, and isoparametric finite elements for composites with layers under rotation. Variational formulations and symmetric operators are employed in hydroelastic, elastoacoustic, and elasto-capillarity, particularly in coupling modes. M.S.K.

A82-34493 # Flow visualization techniques for the study of high incidence aerodynamics. H. Werlé (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(NATO, AGARD, Lecture Series on Study of High Incidence Aerodynamics, 121st, Rhode-Saint-Genèse, Belgium, Mar. 15-19, 1982, Hampton, VA, Mar. 10, 11, 1982, Gottingen, West Germany, Mar. 22-26, 1982.) ONERA, TP* no. 1982-5, 1982. 28 p. 77 refs.

Descriptions are given of the use of solid, liquid or gas tracers in water and wind tunnels for the visualization of aerodynamic flows, with emphasis on the methods employed by the experimental facilities of ONERA. The range of visualization techniques covered reveal flow patterns with all their parietal singularities, as well as the evolution of such patterns as a function of such aerodynamic parameters as incidence, yaw angle and Reynolds number. Visualization methods also reveal the separation phenomena which characterize high incidence angle aerodynamics, and they precisely define vortical, transitional and unsteady flow regimes. The aerodynamic surfaces tested by visualization methods include airfoil profiles, sweptback wings, slender bodies, inlets, and entire aircraft configurations. Attention is given the layout of ONERA and other water tunnel facilities. O.C.

A82-34495 # Instrumentation for testing aircraft antistatic protection. J. Taillet, J. L. Boulay, and M. Chalanier (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(International Aerospace Conference on Lightning and Static Electricity, Oxford University, Oxford, England, Mar. 23-25, 1982.) ONERA, TP* no. 1982-7, 1982. 11 p. 11 refs. Research supported by the Direction des Recherches, Etudes et Techniques.

Methods and standards relating to aircraft protection against precipitation statics are discussed, and two instruments, the INJECO and CORAS, are presented. Engineering tests are performed with the instruments to facilitate the solution of problems encountered by manufacturers and airlines with precipitation statics. An advantage of INJECO is the assessment of noise produced by local discharges following charge accumulation on insulating surfaces. Synchronous detection with the CORAS device permits the measurement of relatively small voltage drops along the resistive layer in the presence of the large capacitive voltage drop across the insulating coating. When CORAS is used on DC modes, its operation is conventional and is useful in resistive coating processing to compare DC and AC surface resistance measurements. D.L.G.

A82-34497 # Comparison of aerodynamic characteristics of aircraft models with forward and aft swept wings at Mach number 0.5. O. du Boucheron and Y. Brocard (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(University of Bristol and Royal Aeronautical Society, International Forward Swept Wing Aircraft Conference, University of Bristol, Bristol, England, Mar. 24-26, 1982.) ONERA, TP* no. 1982-9, 1982. 12 p. 14 refs.

A schematic model with a 21-cm span was tested in the transonic S3Ch wind tunnel at M equals 0.5 to obtain aerodynamic data on various configurations with forward and aft swept wings with or without canards. Flow characteristics were described using flow visualizations in a water tunnel and in a wind tunnel. Results of calculations using a panel method show that the use of canards improves the forward swept wing flow field, even at low angles of attack. The longitudinal and lateral characteristics were compared, and various effects were investigated, including presence, location and sweep angle of canards, height of the wind relative to the fuselage and presence and sweep angle of the vertical tail. A

Theoretical and experimental analyses of the effects of very heavy rain on aircraft performance are summarized. Analysis reveals momentum loss, increased drag, and reduced lift resulting from cratering of the rainwater film on airfoils by raindrops. Momentum penalties were derived from a combined drop trajectory/potential flow analysis. The derived penalties were introduced into a digital flight simulation program and the effect of very heavy rain was compared to that of wind shear by performing landings in combinations of wind, rain, no wind, and no rain. Results show that the derived wind shears of accident reconstructions are too large because a significant part of the loss in indicated airspeed is caused by rain. Author (ESA)

THE DFVLR DIGITAL FLIGHT DATA READOUT AND PROCESSING STATION AND ITS UTILITY

H. Hardegen *In its* Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 217-245

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

Efforts to meet aviation authority requirements, scientific interest, and commercial requests at a flight data readout and processing station are described, with emphasis on bit rates, data fault correction, and reduction of data loss during transcription and reformatting. Regenerated data are recorded on computer tape and an eight-channel plot which provides a quick look the preceding flight history during regeneration is produced. All the computer programs are modular. After the program is started, the initital and final blocks are requested as the parameters to be calculated. Conversion from digital to engineering units is checked manually. Data losses are easily localized by counting the frames per minute and checking the synchronization words. Author (ESA)

SIDESLIP INDICATION SYSTEM AS A FUEL SAVING AID IN JET TRANSPORT AIRCRAFT OPERATION

Dieter Horst *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 247-275

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

The relationship between sideslip angle heading constant, and roll angle is outlined and a sideslip sensor is described. A conical pressure sensing probe extends through the fuselage perpendicular to the local air flow. Unequal pressure arising from sideslip causes two paddle blades to rotate the probe until pressure on each paddle is equal, i.e., until the probe is realigned with the airstream. During rotation, output elements attached to the probe are also rotated, providing electrical signals proportional to sideslip angle to an indicator. Tests on an A-300 Airbus show that avoiding sideslip cuts fuel consumption by 0.2%. Author (ESA)

AN INTERMEDIATE SOLUTION BETWEEN BASIC AND EXPANDED AIRCRAFT INTEGRATED DATA SYSTEMS (AIDS) c35

Claude Robert *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 277-300 refs

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

A single digital flight data acquisition and management unit, divided for reliability into two parts, is proposed as an alternative to ARINC 717. One part deals with mandatory parameters which are sampled, coded, and transmitted in a PCM stream to the digital flight data recorder. The second part processes the parameters and is user programmable. Analysis consists of exceedance processing (e.g., engine, nacelle) gas pass analysis, AIDS monitoring and aircraft system warning from the flight warning computer. Airline response indicates that this system meets their requirements. Author (ESA)

FLIGHT DATA RECOVERY UNDER ADVERSE CONDITIONS

E. J. Rosenbauer *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 301-322 ref

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

Methods for overcoming data loss, including bit dump, bit shift, forward and reverse readout, time displacement compensation (TDC), wideband TDC, and supersynchronization are discussed. Supersynchronization systems recognize acquisition of any one sync word as an in-sync condition and process accordingly. They open a window prior to the end of the subframe which enables the circuit to look for the next sync work up to 8 bits early. A feedback loop enables one shot timing methods to track the average bit rate automatically. A time duration equal to 70.7% of the average bit period is recommended. A digital bit averaging technique, in which the bit decision time is determined by the average of the two previous bits, gives excellent results. With forward and reverse processing, data are processed in the usual way through the engineering conversion process. Valid data, prior to the out of sync area, look normal. The computer then goes to the end of the subframe and processes data from this point backwards toward the sync loss area. Author (ESA)

GAS PATH ANALYSIS OF COMMERCIAL AIRCRAFT ENGINES

Louis A. Urban *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 323-357

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

A mathematical means of determining overall engine performance, individual module performance and sensor performance from any specified set of engine parameters is introduced. If Ze = HeXe, where Ze is a set of engine measurement deltas, X2 is a set of engine module deviations and He is a set of partial derivatives, interrelating the two sets, it follows that Xe can be solved for by taking the product of Ze times the inverse of He (the diagnostic matrix). A maximum likelihood estimation technique ensures that measurements are noise free. Operating mode can include in-flight or ground-based analysis. Airline experience shows that gas path analysis is cost effective and technically sound. Author (ESA)

GROUND SPEED MEASUREMENT FROM DME/VHF OMNIRANGE NAVIGATION (VOR) DATA

P. Voersmann *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 359-380 refs

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

Off-line computer results of DME/VOR ground speed are compared with data from an airborne inertial navigation system platform. Signal properties of DME/VOR data are discussed, and requirements for filtering the data are stated. Best agreement between the two systems (within 2 knots) is achieved when the aircraft is flying on a constant radial, i.e., when the radial ground speed is negligibly small. Oscillation of the radial ground speed component around low frequencies is attributed to hardware limitations. Author (ESA)

GATHERING AND ANALYSING DATA ON THE BRITISH AIRWAYS BOEING 757 AIRCRAFT

Peter Waller *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 381-393

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

The maintenance and operational benefits of a data system connected to 24 serial digital data paths between avionics units are described. The set up includes a quick access recorder with on onboard playback capability, using a printer-plotter on the flight deck. A single unit collects, processes and distributes parameters. Separate processors handle the mandatory and integrated data system operations. Any parameter can be displayed, call up being through a simple mnemonic. Routine evaluation programs monitor flight operations, propulsion units, autoland performance and integrity, fuel performance, and the autoflight system. Engineers can request a printout of the times at which defined points of the flight occured, and use these to define the time at which reported incidents happened. The relevant parameters for this, and adjacent times, are quickly available. Author (ESA)

VALUE OF SURVIVABILITY AND RECOVERABILITY OF

FLIGHT DATA RECORDERS
James W. Wells and W. Donald Wells *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p 419-440 refs
Avail: NTIS HC A20/MF ; DFVLR, Cologne DM 122,90

Alternative design approaches to provide survival recorded flight information offer different degrees of effectiveness. The method of protecting recorded information selected in a given application should be that which provides the most economically effective capability. The value of accident information is derived from its usefulness in accident prevention. Capability and design trades for survivability versus contributions to usefulness of information is considered in terms of economic measurement. A method is outlined for assessing recorder survivability and recoverability direct benefits, (reduced cost of investigating accident or criminal intent) and bottom line benefits (reduction of aircraft grounding expenses or reduction of fault correction cost by more reliable data inputs). A.R.H.

ANALYSIS OF TRANSIENT DATA FROM AIRCRAFT GAS TURBINE ENGINES USING AIDS
E. R. White *In* DFVLR Proc. of the 11th Symp. on Aircraft Integrated Data Systems Nov. 1981 p441-453

Avail: NTIS HC A20/MF A01; DFVLR, Cologne DM 122,90

Takeoff margin trending is used to illustrate engine monitoring, using in-flight data. For each takeoff, engine pressure ratio (EPR) data are collected at 80 knots, and the peak turbine temperature prior to liftoff is modified by an amount equal to any subsequent throttle movement. Total air temperature at 100 knots is converted to a static air temperature by subtracting an amount equivalent to the ram rise. Peak turbine temperature is corrected to ISA conditions, then for EPR, to a full rated takeoff level. This gives the turbine temperature that the engine would have produced at a full rated thrust under ISA conditions. The corrected temperature is subtracted from the red line limit, giving a margin which is plotted as a historical trend. These margins agree almost exactly with ground run data.

PREDICTION OF WING SIDE-EDGE SUCTION FORCES AND MAXIMUM INVISCID LIFT Ph.D. Thesis
C. Redelinghuys Sep. 1981 244 p refs
Avail: NTIS HC A11/MF A01

The possibility of predicting the characteristics of low aspect-ratio wings theoretically is investigated. A literature survey on theoretical techniques for edge seperated flows, vortex breakdown and maximum theoretical wing lift is presented. It is shown that prediction of the maximum theoretical lift by means of the suction analogy leads to results which differ from those obtained by means of previous techniques. Comparisons with experiment shows that low aspect ratio rectangular wings do achieve lift coefficients close to the theoretical maximum value. A new method, based on Lan's quasi-vortex-lattice method and the suction analogy, is developed for the prediction of the aerodynamics of unconventional planforms. Author

AN ANALYTICAL PROCEDURE FOR COMPUTING SMOOTH TRANSITIONS BETWEEN TWO SPECIFIED CROSS SECTIONS WITH APPLICATIONS TO BLENDED WING BODY CONFIGURATION
Raymond L. Barger May 1982 20 p refs
(NASA-TP-2012; L-15053; NAS 1.60:2012) Avail: NTIS HC A02/MF A01 CSCL 01A

An analytical procedure is described for designing smooth transition surfaces for blended wing-body configurations. Starting from two specified cross section shapes, the procedure generates a gradual transition from one cross section shape to the other as an analytic blend of the two shapes. The method utilizes a conformal mapping, with subsequent translation and scaling, to transform the specified and shapes to curves that can be combined more smoothly. A sample calculation is applied to a blended wing-body missile type configuration with a top mounted inlet.

A HARMONIC ANALYSIS METHOD FOR UNSTEADY TRANSONIC FLOW AND ITS APPLICATION TO THE FLUTTER OF AIRFOILS Final Report
F. Edward Ehlers and Warren H. Weatherill Washington NASA May 1982 151 p refs
(Contract NAS1-15957)
(NASA-CR-3537; NAS 1.26:3537; D6-49821) Avail: NTIS HC A08/MF A01 CSCL 01A

A finite difference method for solving the unsteady transonic flow about harmonically oscillating wings is investigated. The procedure is based on separating the velocity potential into steady and unsteady parts and linearizing the resulting unsteady differential equation for small disturbances. The differential equation for the unsteady velocity potential is linear with spatially varying coefficients and with the time variable eliminated by assuming harmonic motion. A study is presented of the shock motion associated with an oscillating airfoil and its representation by the harmonic procedure. The effects of the shock motion and the resulting pressure pulse are shown to be included in the harmonic pressure distributions and the corresponding generalized forces. Analytical and experimental pressure distributions for the NACA 64A010 airfoil are compared for Mach numbers of 0.75, 0.80 and 0.842. A typical section, two-degree-of-freedom flutter analysis of a NACA 64A010 airfoil is performed. The results show a sharp transonic bucket in one case and abrupt changes in instability modes. Author

Flight management computer
[SNIAS-821-111-110] N82-24842
An analytical procedure for computing smooth transitions between two specified cross sections with applications to blended wing body configuration
[NASA-TP-2012] N82-25193
F-16E program overview and wind tunnel/flight correlation
N82-25207
Water tunnel flow visualization and wind tunnel data analysis of the F/A-18 --- leading edge extension vortex effects
[NASA-CR-165859] N82-25215
Materials and structures/ACEE
[NASA-FACTS-117/8-81] N82-25242

AERODYNAMIC DRAG
The initial lift and drag of an impulsively started airfoil of finite thickness
A82-34538
Review of the 1980 Wind-Tunnel/Flight Correlation Panel
N82-25198
Experimental analysis of the effects of sweep and aspect ratio on incompressible flow about forward swept wings
[AD-A111128] N82-25223

AERODYNAMIC FORCES
Forward-swept-wing technology
A82-33309
Finite element calculation of the aerodynamic forces on a vibrating wing in supersonic flow
A82-34128
Hysteresis of the normal force of a wing of complex planform under unsteady motion
A82-34157
Accounting for thickness effects in the calculation of subcritical unsteady aerodynamic forces: Application to wing-fuselage interactions
[SNIAS-821-111-106] N82-24183
Experimental verification of force determination and ground flying on a full-scale helicopter
[USAAVRADCOM-TR-81-D-11] N82-24199

AERODYNAMIC HEATING
Approximate method of predicting heating on the windward side of Space Shuttle Orbiter and comparisons with flight data
[AIAA PAPER 82-0823] A82-31853
An experimental study at free-stream Mach 5 of the aerodynamic heating of the upper surface of plane wings of various planforms
A82-34149

AERODYNAMIC INTERFERENCE
Closed-form solutions of supersonic wing-body interference
A82-33120
Darrieus rotor aerodynamics
A82-33708
Experimental determination of flow-interference effects of wing-mounted, two-dimensional, full-capture propulsion nacelles in close proximity to a vehicle body at a Mach number of 6
[NASA-TM-83287] N82-25217

AERODYNAMIC LOADS
On the aerodynamics of windblast
[AD-A110495] N82-25221
Statistical review of counting accelerometer data for Navy and Marine fleet aircraft from 1 January 1962 to 30 June 1981
[AD-A110660] N82-25243

AERODYNAMIC NOISE
Aeroacoustic performance of an externally blown flap configuration with several flap noise suppression devices
[NASA-TP-1995] N82-24942

AERODYNAMIC STABILITY
Downwash behind a wing with spanwise blowing
A82-33514
Will ABC technology produce the next-generation helicopter
A82-33916
Instability effects on pylon and engine loading in an aircraft with high-aspect-ratio wings
A82-34163
Guidance and control/ACEE
[NASA-FACTS-95/8-81] N82-25261

AERODYNAMIC STALLING
Effects of dynamic stall on SWECS --- Small Wind Energy Conversion System
A82-33707
Will ABC technology produce the next-generation helicopter
A82-33916
Aeroelasticy of compressor blades: Subsonic stall flutter
N82-26189

AERODYNAMICS
Vertical takeoff technology - Flight mechanics, aerodynamics, and propulsion systems --- German book
A82-33348
Aerodynamics. Part 2 - Methods of aerodynamic design /3rd revised and enlarged edition/ --- Russian book
A82-33387
Aerodynamics: The science of air in motion /2nd edition/ --- Book
A82-33671
Flow visualization techniques for the study of high incidence aerodynamics
[ONERA, TP NO. 1982-5] A82-34493
Combining analysis with optimization at Langley Research Center. An evolutionary process
[NASA-TM-84472] N82-24846

AEROELASTICITY
Identification of the form of motion of an aircraft
A82-31824
Finite element calculation of the aerodynamic forces on a vibrating wing in supersonic flow
A82-34128
Development of a control law for the alleviation of maneuver loads on an elastic aircraft
A82-34144

An algorithm for calculating the compliance matrices of aircraft structures by the substructure method as applied to aeroelasticity problems
A82-34161

A method of accounting for the effect of aircraft deformations on its loading
A82-34177

The determination of critical flutter conditions of nonlinear systems
[RAE-TM-STRUCT-986] N82-24210

A method for determining the aeroelastic behavior of aircraft with active control systems
[ESA-TT-719] N82-24211

Combining analysis with optimization at Langley Research Center. An evolutionary process
[NASA-TM-84472] N82-24846

Aeroelasticy of compressor blades: Subsonic stall flutter
N82-26189

AERONAUTICAL ENGINEERING

The first A in NASA
[GPO-89-476] N82-25271

AERONAUTICS

Essentials of aviation management /2nd edition/ --- Book
A82-33648

AEROSPACE ENGINEERING

Aerospace engineers: We're tomorrow-minded people
[NASA-EP-188] N82-25017

La Recherche Aerospatiale, Bi-monthly bulletin, number 1981-6, November-December 1981 --- aerodynamic research
[ESA-TT-741] N82-26185

AEROSPACE INDUSTRY

British aerospace begins update effort
A82-32624

The aerospace learning process --- review of some past projects
[AIAA PAPER 82-1291] A82-33025

International aerospace review; Proceedings of the First International Aerospace Symposium, Le Bourget, Seine-Saint-Denis, France, June 2, 3, 1981
A82-34101

Aeronautical research and development
A82-34114

Technical trends in the civil aircraft and helicopter industry
A82-34120

AEROSPACEPLANES

Structures testing analysis real-time network (STARNET)
[AD-A111636] N82-25827

AEROTHERMODYNAMICS

Radiation enhancement by nonequilibrium during flight through the Titan atmosphere
[AIAA PAPER 82-0878] A82-31883

Gas turbine aero-thermodynamics with special reference to aircraft propulsion --- Book
A82-33650

An experimental study at free-stream Mach 5 of the aerodynamic heating of the upper surface of plane wings of various planforms
A82-34149

AFTERBODIES

Aerodynamic interactions with turbulent jet exhaust plumes
A82-33325

AH-1G HELICOPTER

Experimental verification of force determination and ground flying on a full-scale helicopter
[USAAVRADCOM-TR-81-D-11] N82-24199

AILERONS

Structural optimization of a swept wing on the basis of the aileron efficiency condition
A82-34145

Investigation on rotating ailerons
N82-26162

AIR COOLING

Air cooling of gas turbine blades
A82-34700

AIR FLOW

Aerodynamics: The science of air in motion /2nd edition/ --- Book
A82-33671

Experimental study on discharge and loss coefficients of combustor swirlers
A82-34644

Adaptive-wall wind-tunnel research at NASA-Ames Research Center
[NASA-TM-84236] N82-24214

AIR LAUNCHING

Wind tunnel studies of store separation with load factor - Freedrops and captive trajectories
A82-33626

AIR LAW

Predicting the application of vicarious liability to fixed base operators - Still guesswork after all these years
A82-32056

Aviation accident investigation - Functional and legal perspectives
A82-32059

Factors influencing settlement of personal injury and death claims in aircraft accident litigation
A82-32062

Aviation negotiations and the U.S. model agreement
A82-32063

AIR NAVIGATION

Aviation electronics /4th edition/ --- Book
A82-33646

Operational testing of the LN-33 inertial navigation system
A82-33854

Short-term behavior of a Doppler navigation system and comparison with position indication by means of scanning radar
A82-34672

AIR QUALITY

In situ ozone data for comparison with laser absorption remote sensor: 1980 PEPE/NEROS program
[NASA-TM-84471] N82-25661

AIR TRAFFIC CONTROL

Marine Air Traffic Control and Landing System (MATCALS Investigation), volume 1
[AD-A110862] N82-24188

Marine Air Traffic Control and Landing System (MATCALS Investigation), volume 2
[AD-A110863] N82-24189

Round table discussion on the transfer of results from the project "Aids to navigation and control of air traffic"
[FUB-20-ATC-1981] N82-24192

On-line experiments in acquiring and exploiting AIDS data for ATC purposes
N82-25175

A pilot's view on possible uses of AIDS --- airborne collision avoidance systems
N82-25176

Aeronautical information data subsystems --- air navigation
N82-25178

Evaluation of a voice recognition system for the NOTAS pseudo pilot station function
[NASA-TM-84487] N82-25235

AIR TRANSPORTATION

Aviation negotiations and the U.S. model agreement
A82-32063

Aircraft evaluation in air network planning
A82-33125

The U.S. airline industry - En route to deregulation
A82-33920

Commercial transport developments for the 1980's
A82-34109

Solutions to the aviation fuel problem
A82-34113

Business jets to agricultural aircraft - An overview of general aviation
A82-34123

AIRBORNE EQUIPMENT

A system design for a multispectral sensor using two-dimensional solid-state imaging arrays
A82-31991

An optical data link for airborne scanning system
A82-34737

Testing of the Kuiper Airborne Observatory 91-CM telescope
[NASA-CR-166341] N82-25040

Airborne gamma-ray spectrometer and magnetometer survey. Barrow quadranagle, Alaska, volume 2
[DE82-000342] N82-25623

AIRBORNE SURVEILLANCE RADAR

Cloud top remote sensing by airborne lidar
A82-32920

A pilot's view on possible uses of AIDS --- airborne collision avoidance systems
N82-25176

XV-15 - Foretelling things to come
A82-33914
Aerodynamic coefficient identification of time-varying aircraft system and its application
A82-34645
Short-term behavior of a Doppler navigation system and comparison with position indication by means of scanning radar
A82-34672
Wind-Tunnel/Flight Correlation, 1981
[NASA-CP-2225] N82-25196
Wind-tunnel/flight-drag correlation
N82-25199
Wind-tunnel/flight correlation program on XB-70-1
N82-25201
Problems in correlation caused by propulsion systems
N82-25202
Opportunities for wind-tunnel/flight correlation with new Boeing airplanes
N82-25206
F-16E program overview and wind tunnel/flight correlation
N82-25207
Application of Computational Fluid Dynamics (CFD) in transonic wind-tunnel/flight-test correlation
N82-25211

FLIGHT TIME
Solar-powered airplane design for long-endurance, high-altitude flight
[AIAA PAPER 82-0611] A82-31984
Statistical review of counting accelerometer data for Navy and Marine fleet aircraft from 1 January 1962 to 30 June 1981
[AD-A110660] N82-25243

FLOW CHARACTERISTICS
Incompressible symmetric flow characteristics of sharp-edged rectangular wings
A82-32850
Effects of dynamic stall on SWECS --- Small Wind Energy Conversion System
A82-33707

FLOW COEFFICIENTS
Experimental study on discharge and loss coefficients of combustor swirlers
A82-34644

FLOW DISTRIBUTION
Evaluation of two analytical methods for the prediction of inlet flow fields in the vicinity of generalized forebodies
[AIAA PAPER 82-0959] A82-31935
Aerodynamic interactions with turbulent jet exhaust plumes
A82-33325
Flow visualization techniques for the study of high incidence aerodynamics
[ONERA, TP NO. 1982-5] A82-34493
An experimental investigation of the flow field of an ejector wing design employing a photon correlation laser velocimeter
[AD-A111134] N82-24182
Study of VTOL in ground-effect flow field including temperature effect
[NASA-CR-166258] N82-25170
Investigation of the tip clearance flow inside and at the exit of a compressor rotor passage
[NASA-CR-169004] N82-25253

FLOW GEOMETRY
Subsonic 3-D surface panel method for rapid analysis of multiple geometry perturbations
[AIAA PAPER 82-0993] A82-31954
Similarity parameters for the geometric structure of a supersonic jet propagating in a channel and in a submerged space
A82-34132

FLOW MEASUREMENT
Three dimensional turbulent boundary layer development on a fan rotor blade
[AIAA PAPER 82-1007] A82-31965

FLOW THEORY
The problem of calculation of the flow around helicopter rotor blade tips --- and adapting computer programs
[MBB-UD-330-81-O] N82-25233

FLOW VELOCITY
Calculation of the flow-field velocities of a wing-body-stores combination in transonic flow
[AIAA PAPER 82-0958] A82-31934
Three dimensional mean velocity and turbulence characteristics in the annulus wall region of an axial flow compressor rotor passage
[NASA-CR-169003] N82-25252

FLOW VISUALIZATION
Flow visualization techniques for the study of high incidence aerodynamics
[ONERA, TP NO. 1982-5] A82-34493

FLUID FILMS
Evaluation of three percent Aqueous Film Forming Foam (AFFF) concentrates as fire fighting agents --- JP-4 jet fuel fires
[AD-A110821] N82-25402

FLUID INJECTION
Experimental investigation of turbulent wall-jets in the presence of adverse pressure gradients in a rectangular diffuser
A82-32330

FLUTTER ANALYSIS
Parameter identification for structures with neighboring natural frequencies especially for the case of flight resonance tests
A82-32136
Eigenspace techniques for active flutter suppression
[NASA-CR-168931] N82-24206
Application of modal control to wing-flutter suppression
[NASA-TP-1983] N82-24209
The determination of critical flutter conditions of nonlinear systems
[RAE-TM-STRUCT-986] N82-24210
A harmonic analysis method for unsteady transonic flow and its application to the flutter of airfoils
[NASA-CR-3537] N82-25194
Subsonic aerodynamic and flutter characteristics of several wings calculated by the SOUSSA P1.1 panel method
[NASA-TM-84485] N82-25216

FOAMS
Evaluation of three percent Aqueous Film Forming Foam (AFFF) concentrates as fire fighting agents --- JP-4 jet fuel fires
[AD-A110821] N82-25402

FOG
Environmental fog/rain visual display system for aircraft simulators
[NASA-CASE-ARC-11158-1] N82-24212

FORCE DISTRIBUTION
Experimental verification of force determination and ground flying on a full-scale helicopter
[USAAVRADCOM-TR-81-D-11] N82-24199
Statistical review of counting accelerometer data for Navy and Marine fleet aircraft from 1 January 1962 to 30 June 1981
[AD-A110660] N82-25243

FOREBODIES
Evaluation of two analytical methods for the prediction of inlet flow fields in the vicinity of generalized forebodies
[AIAA PAPER 82-0959] A82-31935

FORGING
Material flow and defect formation in forging an airfoil shape from metal-matrix composites
A82-33995

FORKS
OV-10A nose gear fork damage analysis
[AD-A111492] N82-25244

FORMING TECHNIQUES
Formability of metallic materials - 2000 A.D.; Proceedings of the Symposium, Chicago, IL, June 24, 25, 1980
A82-33989

FORTRAN
STGSTK: A computer code for predicting multistage axial flow compressor performance by a meanline stage stacking method
[NASA-TP-2020] N82-25250

FRACTURE MECHANICS
OV-10A nose gear fork damage analysis
[AD-A111492] N82-25244
Fracture mechanics criteria for turbine engine hot section components
[NASA-CR-167896] N82-25257

FREE FLOW
An experimental study at free-stream Mach 5 of the aerodynamic heating of the upper surface of plane wings of various planforms
A82-34149

FREE JETS
Model based study of various configurations of jet crossing a cavity - Application to the CEPRA 19 wind tunnel of CEPr
A82-33627
FRICTION
Tire tread temperatures during antiskid braking and cornering on a dry runway
[NASA-TP-2009] N82-24193
Lubricant effects on efficiency of a helicopter transmission
[NASA-TM-82857] N82-25520
FUEL COMBUSTION
Ideal ramjet - Optimum M sub infinity for fuel limit and material limit
A82-33143
FUEL CONSUMPTION
System study of application of composite materials for future transport aircraft
[AIAA PAPER 82-0812] A82-31985
Principles of efficient energy use at Interflug
A82-33250
Commercial transport developments for the 1980's
A82-34109
Impact study of synthetic and alternative fuel usage in Army aircraft propulsion systems
[AD-A111046] N82-24355
Flight management computer
[SNIAS-821-111-110] N82-24842
Cost and fuel consumption per nautical mile for two engine jet transports using OPTIM and TRAGEN
[NASA-CR-168973] N82-25239
Materials and structures/ACEE
[NASA-FACTS-117/8-81] N82-25242
Propulsion/ACEE
[NASA-FACTS-93/8-81] N82-25251
FUEL PRODUCTION
Fuel quality processing study, volume 1
[NASA-CR-165327-VOL-1] N82-24649
Fuel quality/processing study. Volume 2: Appendix. Task 1 literature survey
[NASA-CR-165327-VOL-2] N82-24650
FUEL TANKS
F-15 rotary balance data for an angle-of-attack range of 8 deg to 90 deg
[NASA-CR-3478] N82-24168
Rotary balance data for an F-15 model with conformal fuel tanks for an angle-of-attack range of 8 deg to 90 deg
[NASA-CR-3516] N82-24169
FUSELAGES
Transonic flow past bodies of the type wing-fuselage with allowance for boundary effects
A82-34166
Experimental verification of force determination and ground flying on a full-scale helicopter
[USAAVRADCOM-TR-81-D-11] N82-24199
Adapter for mounting microphone flush with the external surface of the skin of a pressurized aircraft
[NASA-CASE-FRC-11072-1] N82-24474

G

GAMMA RAY SPECTROMETERS
Airborne gamma-ray spectrometer and magnetometer survey. Ikpikpuk River quadrangle, Alaska, volume 2
[DE82-000314] N82-24620
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 1
[DE82-004150] N82-24629
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 2
[DE82-004169] N82-24630
Airborne gamma-ray spectrometer and magnetometer survey. Barrow quadranagle, Alaska, volume 2
[DE82-000342] N82-25623
GARBAGE
Primary sewage treatment plant as a source of bird hazards at airport
A82-33523
GAS FLOW
Gas path analysis of commercial aircraft engines
N82-25184
GAS INJECTION
Hypersonic interactions with surface mass transfer. I - Steady flow over a slender wedge wing
[AIAA PAPER 82-0979] A82-31944
Numerical investigation of supersonic base flow with parallel injection --- in scramjet combustors
[AIAA PAPER 82-1001] A82-31960
GAS LASERS
Starting transients in supersonic nozzles and nozzle-diffuser assemblies
[AD-A111143] N82-25226
GAS MIXTURES
Mach reflection of a shock wave from an inclined wall
A82-34748
GAS TURBINE ENGINES
Gas turbine aero-thermodynamics with special reference to aircraft propulsion --- Book
A82-33650
The TM 333, a trump card for Turbomeca
A82-33750
The superalloys - Materials for gas turbine hot section components
A82-33853
A study of the vibration loading of the turbine blades of an aircraft gas-turbine engine with dry-friction dampers
A82-34814
Impact study of synthetic and alternative fuel usage in Army aircraft propulsion systems
[AD-A111046] N82-24355
Evaluation of inelastic constitutive models for nonlinear structural analysis --- for aircraft turbine engines
[NASA-TM-82845] N82-24502
Analysis of transient data from aircraft gas turbine engines using AIDS
N82-25189
Cost/benefit studies of advanced materials technologies for future aircraft turbine engines: Materials for advanced turbine engines
[NASA-CR-167849] N82-25254
Low NOx heavy fuel combustor concept program
[NASA-CR-165367] N82-25635
GAS TURBINES
Air cooling of gas turbine blades
A82-34700
Evaluation of cast titanium alloy compressor components, volume 1
[AD-A111431] N82-24204
GEAR TEETH
Mathematical models for the synthesis and optimization of spiral bevel gear tooth surfaces --- for helicopter transmissions
[NASA-CR-3553] N82-25516
GEARS
Lubricant effects on efficiency of a helicopter transmission
[NASA-TM-82857] N82-25520
GENERAL AVIATION AIRCRAFT
Predicting the application of vicarious liability to fixed base operators - Still guesswork after all these years
A82-32056
Flight evaluation of Loran-C for general aviation area navigation
A82-33049
Technical trends in the civil aircraft and helicopter industry
A82-34120
Business jets to agricultural aircraft - An overview of general aviation
A82-34123
OLGA - A gust alleviation for general aviation aircraft
A82-34374
Solid state crash survivable flight data recorders for mishap investigation
N82-25173
GEODETIC COORDINATES
Transformation relations for singularity avoidance in three-dimensional trajectory optimization
A82-32137
GEODETIC SURVEYS
Applications of a multiplexed GPS user set
A82-33050

GEOLOGICAL SURVEYS
Airborne gamma-ray spectrometer and magnetometer survey. Ikpikpuk River quadrangle, Alaska, volume 2
[DE82-000314] N82-24620
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 1
[DE82-004150] N82-24629
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 2
[DE82-004169] N82-24630
Airborne gamma-ray spectrometer and magnetometer survey. Barrow quadranagle, Alaska, volume 2
[DE82-000342] N82-25623

GLIDE PATHS
Determination of the glide path of an aircraft with power off
A82-34154

GLOBAL POSITIONING SYSTEM
Applications of a multiplexed GPS user set
A82-33050

GOVERNMENT/INDUSTRY RELATIONS
Considerations for international joint venture development of very large aircraft
[AIAA PAPER 82-0809] A82-31982
The aerospace learning process --- review of some past projects
[AIAA PAPER 82-1291] A82-33025
The U.S. airline industry - En route to deregulation
A82-33920
The first A in NASA
[GPO-89-476] N82-25271

GRAPHITE-EPOXY COMPOSITES
System study of application of composite materials for future transport aircraft
[AIAA PAPER 82-0812] A82-31985
Standard tests for toughened resin composites --- for aircraft structures
[NASA-RP-1092] N82-24301

GRAPHS (CHARTS)
Airborne gamma-ray spectrometer and magnetometer survey. Ikpikpuk River quadrangle, Alaska, volume 2
[DE82-000314] N82-24620
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 1
[DE82-004150] N82-24629
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 2
[DE82-004169] N82-24630

GROUND EFFECT (AERODYNAMICS)
The potential of large aircraft
[AIAA PAPER 82-0804] A82-31980
Analysis of small-aspect-ratio lifting surfaces in ground effect
A82-32223
Study of VTOL in ground-effect flow field including temperature effect
[NASA-CR-166258] N82-25170

GROUND SPEED
Ground speed measurement from DME/VHF omnirange navigation (VOR) data
N82-25185

GRUMMAN AIRCRAFT
X-29A forward-swept-wing demonstrator airplane
N82-25209

GUST ALLEVIATORS
OLGA - A gust alleviation for general aviation aircraft
A82-34374

H

HARMONIC ANALYSIS
A harmonic analysis method for unsteady transonic flow and its application to the flutter of airfoils
[NASA-CR-3537] N82-25194

HARMONIC OSCILLATION
Periodic boundary value problem for the equations of the harmonic oscillation of a rotor blade about the axis of a flapping hinge
A82-34127

HEAT PIPES
Design, fabrication and test of liquid metal heat-pipe sandwich panels
[AIAA PAPER 82-0903] A82-31898

HEAT RESISTANT ALLOYS
The superalloys - Materials for gas turbine hot section components
A82-33853
A status review of NASA's COSAM (Conservation Of Strategic Aerospace Materials) program
[NASA-TM-82852] N82-24326

HEAT TRANSFER
Design, fabrication and testing of an electrical analogue for heat transfer to coated turbine blade
A82-33520
An experimental study at free-stream Mach 5 of the aerodynamic heating of the upper surface of plane wings of various planforms
A82-34149

HEAVY LIFT AIRSHIPS
Current developments lighter than air systems --- heavy lift airships
[NASA-TM-84744] N82-24176

HEAVY LIFT HELICOPTERS
Linear decentralized systems with special structure --- for twin lift helicopters
A82-34359

HELICOPTER CONTROL
No-tail-rotor helicopter tests continue
A82-33095
The ubiquitous helicopter
A82-33913
Linear decentralized systems with special structure --- for twin lift helicopters
A82-34359
Optimization of auto-pilot equations for rapid estimation of helicopter control settings
[AD-A110739] N82-25263

HELICOPTER DESIGN
Structural modification to achieve antiresonance in helicopters
A82-32849
The ubiquitous helicopter
A82-33913
Will ABC technology produce the next-generation helicopter
A82-33916
Mechanical properties of hot isostatic pressed P/M-titanium for helicopter components
[MBB-UD-324-81-O] N82-25383

HELICOPTER ENGINES
The TM 333, a trump card for Turbomeca
A82-33750
Mathematical models for the synthesis and optimization of spiral bevel gear tooth surfaces --- for helicopter transmissions
[NASA-CR-3553] N82-25516

HELICOPTER PERFORMANCE
No-tail-rotor helicopter tests continue
A82-33095

HELICOPTERS
Technical trends in the civil aircraft and helicopter industry
A82-34120
Fatigue life prediction of helicopter pitch link using Kaman life calculation methods
A82-34125
Measuring LF and HF antenna radiation patterns by means of a helicopter
A82-34772
Lubricant effects on efficiency of a helicopter transmission
[NASA-TM-82857] N82-25520

HIGH ALTITUDE
Solar-powered airplane design for long-endurance, high-altitude flight
[AIAA PAPER 82-0811] A82-31984

HIGH ALTITUDE ENVIRONMENTS
The next generation trainer
A82-33908

HIGH ASPECT RATIO
Elastic deformation effects on aerodynamic characteristics for a high-aspect-ratio supercritical-wing model
[NASA-TM-83286] N82-25214

HIGH STRENGTH STEELS
Comparison between probability of detection, sensitivity, and accuracy of five nondestructive inspection methods --- high strength steel aircraft undercarriage retraction cylinders
[NLR-MP-81032-U] N82-24500
HISTORIES
The aerospace learning process --- review of some past projects
[AIAA PAPER 82-1291] A82-33025
HONEYCOMB STRUCTURES
Design, fabrication and test of liquid metal heat-pipe sandwich panels
[AIAA PAPER 82-0903] A82-31098
Temperature fields in three-layer panels with a honeycomb filler during unsteady heating
A82-34135
HOT PRESSING
Mechanical properties of hot isostatic pressed P/M-titanium for helicopter components
[MBB-UD-324-81-O] N82-25343
HYDRAULIC CONTROL
Electro-hydraulic nose wheel steering of the Dornier 228
A82-34373
Fireproof brake hydraulic system
[AD-A111319] N82-25245
HYDRAULIC EQUIPMENT
Fireproof brake hydraulic system
[AD-A111319] N82-25265
HYDRAULIC TEST TUNNELS
Flow visualization techniques for the study of high incidence aerodynamics
[ONERA, TP NO. 1982-5] A82-34493
HYDROGEN FUELS
The potential for long-range high-payload aircraft with alternate fuels
[AIAA PAPER 82-0814] A82-31987
HYDROGEN-BASED ENERGY
Hydrogen economy assessment for long-term energy systems in Japan
A82-32159
HYPERSONIC FLOW
Hypersonic interactions with surface mass transfer. I - Steady flow over a slender wedge wing
[AIAA PAPER 82-0979] A82-31944
HYSTERESIS
Hysteresis of the normal force of a wing of complex planform under unsteady motion
A82-34157

I

ICE FORMATION
Thermodynamic performance of an airplane wing leading edge anti-icing system
[AIAA PAPER 82-0651] A82-31871
Rime ice accretion and its effect on airfoil performance
[NASA-CR-165599] N82-24166
IMAGE ENHANCEMENT
Testing of the Kuiper Airborne Observatory 91-CM telescope
[NASA-CR-166341] N82-25040
IMPACT RESISTANCE
Solid-state flight incident recorder
N82-25172
IMPELLERS
Army's 1st IPI program begun - Blisk impeller followup --- integral blade-disk
A82-31999
IN-FLIGHT MONITORING
Proceedings of the 11th symposium on aircraft integrated data systems --- conferences
[DFVLR-MITT-82-02] N82-25171
An intermediate solution between basic and expanded aircraft integrated data systems (AIDS)
N82-25182
Analysis of transient data from aircraft gas turbine engines using AIDS
N82-25189
INCOMPRESSIBLE FLOW
Incompressible symmetric flow characteristics of sharp-edged rectangular wings
A82-32850
INDUSTRIAL PLANTS
Primary sewage treatment plant as a source of bird hazards at airport
[illegible]
INELASTIC STRESS
Evaluation of inelastic constitutive models for nonlinear structural analysis --- for aircraft turbine engines
[NASA-TM-82845] N82-24503
INERTIAL NAVIGATION
Operational testing of the LN-33 inertial navigation system
A82-33454
INERTIAL PLATFORMS
Ground speed measurement from DME/VHF omnirange navigation (VOR) data
N82-25185
INFLATABLE STRUCTURES
Contact problems involving the flow past an inflated aerofoil
A82-34851
INFORMATION SYSTEMS
Aeronautical information data subsystems --- air navigation
N82-25178
INJURIES
Factors influencing settlement of personal injury and death claims in aircraft accident litigation
A82-32062
INLET AIRFRAME CONFIGURATIONS
F-15 wind-tunnel/flight correlations
N82-25203
INLET FLOW
Evaluation of two analytical methods for the prediction of inlet flow fields in the vicinity of generalized forebodies
[AIAA PAPER 82-0959] A82-31938
Experimental and analytical results of tangential blowing applied to a subsonic V/STOL inlet
[NASA-TM-82847] N82-24163
Investigation of the tip clearance flow inside and at the exit of a compressor rotor passage
[NASA-CR-169009] N82-25253
INLET TEMPERATURE
Air cooling of gas turbine blades
A82-34700
INTERCEPTION
Barriers and dispersal surfaces in minimum-time interception
[NASA-TM-84281] N82-25263
INTERGRANULAR CORROSION
Nondestructive detection of exfoliation corrosion around fastener holes in aluminum wing skins
A82-32723
INTERNATIONAL COOPERATION
Considerations for international joint venture development of very large aircraft
[AIAA PAPER 82-0809] A82-31962
INTERNATIONAL LAW
Aviation negotiations and the U.S. model agreement
A82-32063
INTERNATIONAL TRADE
Military aircraft and international policy
A82-34108
INTERPLANETARY FLIGHT
Radiation enhancement by nonequilibrium during flight through the Titan atmosphere
[AIAA PAPER 82-0878] A82-31883
INTERSECTIONS
Runway end intersection design
A82-33906
INVISCID FLOW
Prediction of wing side-edge suction forces and maximum inviscid lift
N82-25193
Modified version of LTRAN2: A calculation method for inviscid transonic flow about thin airfoils in moderately slow unsteady motion
[NLR-TR-80059-U] N82-25231
IRON ALLOYS
Formability of INCOLOY alloy MA 956 - An oxide dispersion strengthened sheet alloy
A82-33996

J

JET AIRCRAFT
The next generation trainer
A82-33908

Effect of modification of the trailing edge of a separating wall on the downstream mixing of parallel flowing streams
[AD-A111124] N82-24181

TRAILING-EDGE FLAPS
Wing flap-type control effectiveness and effects of control hinge gap seals for a supercritical wing
[AIAA PAPER 82-0960] A82-34008

TRAINING SIMULATORS
The next generation trainer A82-33908

TRAJECTORY ANALYSIS
Wind tunnel studies of store separation with load factor - Freedrops and captive trajectories A82-33626

TRAJECTORY CONTROL
Determination of the glide path of an aircraft with power off A82-34154

TRAJECTORY OPTIMIZATION
Transformation relations for singularity avoidance in three-dimensional trajectory optimization A82-32137

TRANSIENT RESPONSE
Analysis of transient data from aircraft gas turbine engines using AIDS N82-25189

TRANSMISSIONS (MACHINE ELEMENTS)
Mathematical models for the synthesis and optimization of spiral bevel gear tooth surfaces --- for helicopter transmissions
[NASA-CR-3553] N82-25516
Lubricant effects on efficiency of a helicopter transmission
[NASA-TM-82657] N82-25520

TRANSONIC FLOW
A system for the numerical simulation of sub- and transonic viscous attached flows around wing-body configurations
[AIAA PAPER 82-0935] A82-31922
The equivalent simple body /ESB/ method for transonic wing analysis
[AIAA PAPER 82-0936] A82-31923
A high-frequency transonic small disturbance code for unsteady flows in a cascade
[AIAA PAPER 82-0955] A82-31932
Calculation of the flow-field velocities of a wing-body-stores combination in transonic flow
[AIAA PAPER 82-0958] A82-31934
Evaluation of two analytical methods for the prediction of inlet flow fields in the vicinity of generalized forebodies
[AIAA PAPER 82-0959] A82-31935
Calculations of viscous transonic flow over aerofoils
[AIAA PAPER 82-0997] A82-31957
Design of finite element grids for the computation of the three-dimensional transonic flow around a wing
[AIAA PAPER 82-1019] A82-31972
Prediction of separated asymmetric trailing-edge flows at transonic Mach numbers
[AIAA PAPER 82-1021] A82-31974
Transonic flow past bodies of the type wing-fuselage with allowance for boundary effects A82-34166
A harmonic analysis method for unsteady transonic flow and its application to the flutter of airfoils
[NASA-CR-3537] N82-25194
Application of Computational Fluid Dynamics (CFD) in transonic wind-tunnel/flight-test correlation N82-25211
Investigation of upwind schemes for finite element analysis of transonic flow over thin airfoils
[AD-A111168] N82-25225
Modified version of LTRAN2: A calculation method for inviscid transonic flow about thin airfoils in moderately slow unsteady motion
[NLR-TR-80059-U] N82-25231

TRANSONIC FLUTTER
The determination of critical flutter conditions of nonlinear systems
[RAE-TM-STRUCT-986] N82-24210

TRANSONIC WIND TUNNELS
The cryogenic wind tunnel for high Reynolds number testing A82-33317
Status of the national transonic facility
[AIAA PAPER 82-0604] A82-33326
A review of Reynolds number studies conducted in the Langley 0.3-m Transonic Cryogenic Tunnel
[AIAA PAPER 82-0941] A82-34007
Wind-Tunnel/Flight Correlation, 1981
[NASA-CP-2225] N82-25196
Status of the National Transonic Facility N82-25197
Review of the 1980 Wind-Tunnel/Flight Correlation Panel N82-25198
Wind-tunnel/flight-drag correlation N82-25199
Tunnel-to-tunnel correlation N82-25200
Problems in correlation caused by propulsion systems N82-25202

TRANSPORT AIRCRAFT
Very large aircraft - A common response to a rapidly changing global environment
[AIAA PAPER 82-0799] A82-31979
The potential of large aircraft
[AIAA PAPER 82-0804] A82-31980
Multibody transport concept
[AIAA PAPER 82-0810] A82-31983
System study of application of composite materials for future transport aircraft
[AIAA PAPER 82-0812] A82-31985
Commercial transport developments for the 1980's A82-34109
Transport aircraft crash dynamics
[NASA-CR-165851] N82-24186
Study of advanced propulsion systems for Small Transport Aircraft Technology (STAT) program
[NASA-CR-165610] N82-24202
Cost and fuel consumption per nautical mile for two engine jet transports using OPTIM and TRAGEN
[NASA-CR-168973] N82-25239
Aerodynamics/ACEE: Aircraft energy efficiency
[NASA-FACTS-94/8-81] N82-25241
Guidance and control/ACEE
[NASA-FACTS-95/8-81] N82-25261

TRANSPORTATION NETWORKS
Beyond 2000 - The airlift challenge ahead
[AIAA PAPER 82-0815] A82-31988
Aircraft evaluation in air network planning A82-33125

TREADS
Tire tread temperatures during antiskid braking and cornering on a dry runway
[NASA-TP-2009] N82-24193

TURBINE BLADES
An experimental investigation of interfacial temperatures in blade-seal material rubbing of aircraft compressors
[AIAA PAPER 82-0890] A82-31891
Design, fabrication and testing of an electrical analogue for heat transfer to coated turbine blade A82-33520
Darrieus rotor aerodynamics A82-33708
Mechanical and metallurgical considerations in extending the life of turbine blades A82-33855
Air cooling of gas turbine blades A82-34700
A study of the vibration loading of the turbine blades of an aircraft gas-turbine engine with dry-friction dampers A82-34814

TURBINE ENGINES
Fracture mechanics criteria for turbine engine hot section components
[NASA-CR-167896] N82-25257

TURBOCOMPRESSORS
An experimental investigation of interfacial temperatures in blade-seal material rubbing of aircraft compressors
[AIAA PAPER 82-0890] A82-31891
STGSTK: A computer code for predicting multistage axial flow compressor performance by a meanline stage stacking method
[NASA-TP-2020] N82-25250
Three dimensional mean velocity and turbulence characteristics in the annulus wall region of an axial flow compressor rotor passage
[NASA-CR-169003] N82-25252

TURBOFAN ENGINES
  Propulsion/ACEE
    [NASA-FACTS-93/8-81] N82-25251
  Exhaust emissions survey of a turbofan engine for flame holder swirl type augmentors at simulated altitude flight conditions
    [NASA-TM-82787] N82-25255
TURBOJET ENGINES
  Development of high-speed rolling-element bearings. A historical and technical perspective
    [NASA-TM-82884] N82-24497
TURBOMACHINE BLADES
  Turbulent boundary-layer development on a two-dimensional aerofoil with supercritical flow at low Reynolds number
    A82-34398
TURBOPROP AIRCRAFT
  The beginning of the ATR 42 program and its importance
    A82-33543
TURBOPROP ENGINES
  Study of advanced propulsion systems for Small Transport Aircraft Technology (STAT) program
    [NASA-CR-165610] N82-24202
  Future propulsion opportunities for commuter airplanes
    [NASA-TM-82880] N82-24203
  Propulsion/ACEE
    [NASA-FACTS-93/8-81] N82-25251
TURBULENCE
  Generation of noise by turbulence
    [ONERA-P-1981-3] N82-24946
  Three dimensional mean velocity and turbulence characteristics in the annulus wall region of an axial flow compressor rotor passage
    [NASA-CR-169003] N82-25252
TURBULENCE EFFECTS
  Program presentation of the working group separated flow: Problems with rotary wings
    [MBB-UD-336-81-O] N82-25234
TURBULENT BOUNDARY LAYER
  Three dimensional turbulent boundary layer development on a fan rotor blade
    [AIAA PAPER 82-1007] A82-31965
  Turbulent boundary-layer development on a two-dimensional aerofoil with supercritical flow at low Reynolds number
    A82-34398
  Three-dimensional separation and reattachment
    [NASA-TM-84221] N82-24167
  Comparison of boundary layer calculations for the root section of a wing. The September 1979 Amsterdam Workshop test case
    [NLR-MP-80028-U] N82-25232
TURBULENT FLOW
  A numerical study of the turbulent flow past an isolated airfoil with trailing edge separation
    [AIAA PAPER 82-0998] A82-31958
  Shock associated noise of supersonic jets from convergent-divergent nozzles
    A82-32202
  Effect of modification of the trailing edge of a separating wall on the downstream mixing of parallel flowing streams
    [AD-A111124] N82-24181
TURBULENT HEAT TRANSFER
  Approximate method of predicting heating on the windward side of Space Shuttle Orbiter and comparisons with flight data
    [AIAA PAPER 82-0823] A82-31853
TURBULENT JETS
  Experimental investigation of turbulent wall-jets in the presence of adverse pressure gradients in a rectangular diffuser
    A82-32330
  Aerodynamic interactions with turbulent jet exhaust plumes
    A82-33325
TURBULENT WAKES
  Effect of modification of the trailing edge of a separating wall on the downstream mixing of parallel flowing streams
    [AD-A111124] N82-24181
TWO DIMENSIONAL FLOW
  A vortex sheet method for calculating separated two-dimensional flows at high Reynolds number
    [AIAA PAPER 82-1030] A82-31978
  Turbulent boundary-layer development on a two-dimensional aerofoil with supercritical flow at low Reynolds number
    A82-34398
  Nonlinear two-dimensional sail theory
    [AD-A110450] N82-25220

U

UNDERCARRIAGES
  Comparison between probability of detection, sensitivity, and accuracy of five nondestructive inspection methods --- high strength steel aircraft undercarriage retraction cylinders
    [NLR-MP-81030-U] N82-24500
UNSTEADY FLOW
  A high-frequency transonic small disturbance code for unsteady flows in a cascade
    [AIAA PAPER 82-0955] A82-31932
  Mathematical modeling of unsteady separated flow past solid airfoil cascades
    A82-32801
  Hysteresis of the normal force of a wing of complex planform under unsteady motion
    A82-34157
  A harmonic analysis method for unsteady transonic flow and its application to the flutter of airfoils
    [NASA-CR-3537] N82-25194
  Modified version of LTRAN2: A calculation method for inviscid transonic flow about thin airfoils in moderately slow unsteady motion
    [NLR-TR-80059-U] N82-25231
UNSWEPT WINGS
  On the torsional modes of a uniformly tapered solid wing
    A82-34397
  Application of modal control to wing-flutter suppression
    [NASA-TP-1983] N82-24209
UPWASH
  Study of VTOL in ground-effect flow field including temperature effect
    [NASA-CR-166258] N82-25170
URANIUM
  Airborne gamma-ray spectrometer and magnetometer survey. Ikpikpuk River quadrangle, Alaska, volume 2
    [DE82-000314] N82-24620
  Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 1
    [DE82-004150] N82-24629
  Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 2
    [DE82-004169] N82-24630
  Airborne gamma-ray spectrometer and magnetometer survey. Umiat quadrangle, Alaska, volume 2
    [DE82-000312] N82-24632
  Airborne gamma-ray spectrometer and magnetometer survey. Barrow quadranagle, Alaska, volume 2
    [DE82-000342] N82-25623
USER MANUALS (COMPUTER PROGRAMS)
  Production version of the extended NASA-Langley Vortex Lattice FORTRAN computer program. Volume 1: User's guide
    [NASA-TM-83303] N82-25219

V

V/STOL AIRCRAFT
  X-wing and the Navy V/STOL initiative
    A82-33915
  Experimental and analytical results of tangential blowing applied to a subsonic V/STOL inlet
    [NASA-TM-82847] N82-24165
VARIABLE SWEEP WINGS
  Low-speed aerodynamic characteristics of wings with sweep discontinuities
    A82-33997
VELOCITY DISTRIBUTION
  Three dimensional turbulent boundary layer development on a fan rotor blade
    [AIAA PAPER 82-1007] A82-31965
  An experimental investigation of the flow field of an ejector wing design employing a photon correlation laser velocimeter
    [AD-A111134] N82-24182

RAO, D. M.
Leading edge flap system for aircraft control augmentation
[NASA-CASE-LAR-12787-1] N82-25240

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal*, vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. A Continuing Bibliography (Suppl. 153)

OCTOBER 1982

IAA ENTRIES

A82-34976 * # Selected results of the F-15 propulsion interactions program. L. D. Webb and J. Nugent (NASA, Ames Research Center, Edwards, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1041.* 15 p. 10 refs.

A better understanding of propulsion system/airframe flow interactions could aid in the reduction of aircraft drag. For this purpose, NASA and the United States Air Force have conducted a series of wind-tunnel and flight tests on the F-15 airplane. This paper presents a correlation of flight test data from tests conducted at the NASA Dryden Flight Research Facility of the Ames Research Center, with data obtained from wind-tunnel tests. Flights were made at stabilized Mach numbers around 0.6, 0.9, 1.2, and 1.5 with accelerations up to near Mach number 2. Wind-tunnel tests used a 7.5 percent-scale F-15 inlet/airframe model. Flight and wind-tunnel pressure coefficients showed good agreement in most cases. Correlation of interaction effects caused by changes in cowl angle, angle-of-attack, and Mach number are presented. For the afterbody region, the pressure coefficients on the nozzle surfaces were influenced by boattail angles and Mach number. Boundary-layer thickness decreased as angle of attack increased above 4 deg. (Author)

A82-34977 # Selection of a starting system for a low cost single engine fighter aircraft. W. F. Keller (Northrop Corp., Hawthorne, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1043.* 6 p.

Selection of a starting system for a low cost, single engine turbofan fighter aircraft requires identification of ground start alternatives, study of the need for airstart assist and, if the need is found, of available airstart alternatives. It also requires consideration of the special inflight starting requirements of turbofan engines, and evaluation of alternatives on the basis of appropriate design criteria. Review of turbofan engine inflight starting requirements led to the conclusion that the need for airstart assist is real but infrequent, and that multiple airstart assist is not required. Alternatives were identified using the morphological approach. Evaluation, on the basis of both quantitative (weight, volume, cost, etc.) and qualitative criteria (logistics, risk, flexibility, etc.), led to selection of an air turbine cartridge starter. The starter uses compressed air from a start cart as the ground energy source and hot gas from decomposition of hydrazine monopropellant liquid, stored in a sealed cartridge, as the inflight energy source. (Author)

A82-34978 * # Evaluation of a simplified gross thrust calculation method for a J85-21 afterburning turbojet engine in an altitude facility. J. L. Baer-Riedhart (NASA, Ames Research Center, Edwards, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1044.* 12 p. 7 refs.

A simplified gross thrust calculation method was evaluated on its ability to predict the gross thrust of a modified J85-21 engine. The method used tailpipe pressure data and ambient pressure data to predict the gross thrust. The method's algorithm is based on a one-dimensional analysis of the flow in the afterburner and nozzle. The test results showed that the method was notably accurate over the engine operating envelope using the altitude facility measured thrust for comparison. A summary of these results, the simplified gross thrust method and requirements, and the test techniques used are discussed in this paper. (Author)

A82-34979 # Ceramic component development for limited-life propulsion engines. D. W. Richerson and J. M. Wimmer (Garrett Turbine Engine Co., Phoenix, AZ). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1050.* 7 p. DARPA-supported research; Contract No. N00024-76-C-5352.

The use of ceramic materials for high-temperature components in gas turbine engines offers significant payoffs for a broad range of commercial and military applications. However, the task of integrating ceramics into advanced gas turbine engines represents a difficult challenge. In February 1976, the Ceramic Gas Turbine Engine Demonstration Program was initiated with the objective to meet this challenge. The engine selected for the demonstration was the Garrett Model T76 turboprop engine, a 715-horsepower engine whose various derivatives are used both for military and civil aircraft propulsion and as an industrial and marine engine. The turbine section was redesigned to use ceramic gas-path components. An increase of approximately 350 F in turbine inlet temperature was projected to increase engine output to 1000 horsepower and decrease specific fuel consumption by 10%. G.R.

A82-34980 # Energy efficient engine /E3/ technology status. W. B. Gardner (United Technologies Corp., Commercial Products Div., East Hartford, CT). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1052.* 10 p. 15 refs.

The Energy Efficient Engine (EEE) Technology program has the objective to establish the technology readiness of components and subsystems which could be utilized in turbofan engines in the late 1980's, early 1990's. A description is presented of the results of the supporting technology programs, the status and results of the component verification testing to date, and the possibilities for employing the developed technology in connection with the design of an energy efficient, environmentally acceptable engine for the 1990's. Attention is given to aspects of shroudless fan fabrication, the diffuser/combustor model, a combustor sector rig, an uncooled high-pressure turbine rig, supersonic high-pressure turbine cascades, a high-pressure turbine cooling model, aspects of high-pressure turbine leakage control, and subsonic cascades. G.R.

A82-34981 * # Turbine blade nonlinear structural and life analysis. R. L. McKnight, J. H. Laflen (General Electric Co., Cincinnati, OH), G. R. Halford, and A. Kaufman (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1056.* 9 p. 9 refs.

The utility of advanced structural analysis and life prediction techniques was evaluated for the life assessment of a commercial air-cooled turbine blade with a history of tip cracking. Three dimensional, nonlinear finite element structural analyses were performed for the blade tip region. The computed strain-temperature history of the critical location was imposed on a uniaxial strain controlled test specimen to evaluate the validity of the structural analysis method. Experimental results indicated higher peak stresses and greater stress relaxation than the analytical predictions. Life predictions using the Strainrange Partitioning and Frequency Modified approaches predicted 1200 to 4420 cycles and 2700 cycles to crack initiation, respectively, compared to an observed life of 3000 cycles. (Author)

A82-34982 * # Blade loss transient dynamic analysis of turbomachinery. M. J. Stallone, V. Gallardo, A. F. Storace, L. J. Bach, G. Black, and E. F. Gaffney (General Electric Co., Cincinnati, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1057.* 8 p. Contract No. NAS3-22053.

This paper reports on work completed to develop an analytical method for predicting the transient non-linear response of a complete aircraft engine system due to the loss of a fan blade, and to validate the analysis by comparing the results against actual blade loss test data. The solution, which is based on the component element method, accounts for rotor-to-casing rubs, high damping and rapid deceleration rates associated with the blade loss event. A comparison of test results and predicted response show good agreement except for an initial overshoot spike not observed in test. The method is effective for analysis of large systems. (Author)

A82-34983 * # Experimental study of the effects of secondary air on the emissions and stability of a lean premixed combustor. G. Roffe, R. S. V. Raman (General Applied Science Laboratories, Inc., Westbury, NY), and C. J. Marek (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1072.* 10 p. 7 refs. NASA-supported research.

A study of the effects of secondary air addition on the stability and emissions of a gas turbine combustor has been performed. Tests were conducted with two types of flameholders and varying amounts of dilution air addition. Results indicate that NO(x) decreases with increasing dilution air injection, whereas CO is independent of the amount of dilution air and is related to the gas temperature tive, regenerative/intercooled and advanced conventional cycle screening studies were carried out to select the cycle pressure ratio and turbine temperature for each type, considering the effects on installed performance and weight. Design and cycle choices were studied in each engine category including recuperator types, effectiveness, pressure drop, bypass bleed and variable area turbine nozzle. The engine characteristics of each type were then compared using a representative mission. The advanced conventional engine showed the largest potential, the regenerative second and the regenerative/intercooled the least promise for lower installed fuel consumption and improved mission performance. (Author)

A82-35409 * # The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine. R. J. Roelke (NASA, Lewis Research Center, Cleveland, OH) and J. E. Haas (U.S. Army, Propulsion Laboratory, Cleveland, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-222.* 6 p. 9 refs. Members, $2.00; nonmembers, $4.00. (Previously announced in STAR as N82-13114)

A82-35411 # Effect of impeller extended shrouds on centrifugal compressor performance as a function of specific speed. L. Sapiro. *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-228.* 11 p. Members, $2.00; nonmembers, $4.00.

Centrifugal compressors for gas compression applications usually employ low-pressure ratio, backward-swept impellers with vaneless diffusers. To increase the compressor flow range and speed, impeller blades are occasionally trimmed, resulting in an extended shroud configuration. The effect of extended front and back impeller shrouds on the performance of centrifugal compressors with vaneless diffusers, and the variation of this effect as a function of specific speed, is thus of concern and is the subject of this paper. An investigation was carried out on two backward-swept shrouded impellers of common blade tip and inducer hub diameters, but different inducer tip diameters (corresponding to low and high specific speeds), with the front and back shrouds extending 20 percent above the blade's outside diameter. (Author)

A82-35412 # The calculation of deviation angle in axial-flow compressor cascades. L. C. Wang (Nanjing Aeronautics Institute, Nanjing, People's Republic of China), R. Hetherington (Cranfield Institute of Technology, Cranfield, Beds., England), and A. Goulas. *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-230.* 6 p. 17 refs. Members, $2.00; nonmembers, $4.00.

The deviation angles of axial flow compressor cascades have been predicted by solving the Reynolds averaged fully turbulent Navier-Stokes equations. A finite element method has been used. To close the problem an algebraic eddy viscosity turbulent model has been chosen. The introduction of the idea of vorticity to the governing equation enables the establishment of a relation between the entropy and the vorticity fields, and the vorticity transport differential equation in the stream function-vorticity method is replaced by a differential operation. A series of calculations have been carried out to examine the influence of cascade geometry on the deviation angle. Very good agreement has been obtained for small angles of incidence with the correlations produced by NASA and using Carter's rule. Good agreement has also been shown for the variation of deviation angle with the angle of incidence with the experimental data of Felix and Emery, as well as for the distribution of the pressure coefficient along the blade axial chord. (Author)

A82-35413 # Transient vibration of high speed lightweight rotor due to sudden imbalance. M. Sakata (Tokyo Institute of Technology, Tokyo, Japan), H. Ohnabe (Ishikawajima-Harima Heavy Industries Co., Ltd., Tanashi, Tokyo, Japan), and T. Aiba. *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-231.* 8 p. 11 refs. Members, $2.00; nonmembers, $4.00.

A transient vibration analysis is carried out on a flexible disk-flexible shaft system or rigid disk-flexible shaft system subjected to a sudden imbalance which is assumed to represent the effect of blade loss. Galerkin's method is used to solve the basic equation governing a rotating flexible disk, and the equation of motion of the rotor system is numerically solved using the Runge-Kutta method. A model rotor with a blade loss simulator is examined, and shaft vibrations are measured. For subcritical blade loss or sudden increase of imbalance, the maximum amplitude increases with disk flexibility and the analysis with cycloidal front step-type imbalance increase predicts larger peak values in the response curves than that with unit step balance increase. D.L.G.

A82-35415 # Experimental evaluation of squeeze film supported flexible rotors. M. D. Rabinowitz (SCITEC Corp., Sydney, Australia) and E. J. Hahn (New South Wales, University, Kensington, Australia). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-233.* 10 p. 15 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Australian Research Grants Committee.

This paper describes the experimental investigations which were conducted to verify existing theoretical vibration amplitude predictions for centrally preloaded, squeeze film supported flexible rotors. The influence of measurement errors and operating condition uncertainties are quantified. The agreement between theory and experiment was excellent, and it is shown that any discrepancy can be explained in terms of errors in determining the mean lubricant viscosity and the orbit magnitudes. Hence, for the range of parameters investigated, the theoretical model and predictions therefrom are validated. (Author)

A82-35418 # Next generation turboprop gearboxes. W. L. McIntire and D. A. Wagner (General Motors Corp., Detroit Diesel Allison Div., Indianapolis, IN). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-236.* 9 p. 7 refs. Members, $2.00; nonmembers, $4.00.

A new generation of fuel-efficient turboprop propulsion systems is under consideration now that fuel is a significant portion of the direct operating cost of aircraft. Systems in the 5000- to 15,000-hp (3730- to 11,185-kW) range that use conventional propellers or the new propfan are being studied. Reduction gearing for this next generation of turboprops is of significant interest due to new requirements for cruise speed life, and reliability. Detroit Diesel Allison's past experience with the T56 family of turboprop reduction gearboxes is recounted. Probable requirements of the next generation of reduction gearboxes are discussed since new requirements for gearboxes combined with past experience should determine the profile of the next generation of gearboxes. A discussion of gearbox general arrangement and its impact on airframe installation is included, along with comments on reduction ratio, gear arrangement, accessory drives, reliability goals, and probable technology needs. (Author)

A82-35425 # Engine experience of turbine rotor blade materials and coatings. F. N. Davis and C. E. Grinnell (Rolls-Royce, Ltd., Coventry, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-244.* 9 p. 9 refs. Members, $2.00; nonmembers, $4.00.

Corrosion resistance of hot end components was evaluated on Rolls-Royce industrial and marine gas turbines. Early materials and coatings assessment trials were performed, and extended cyclic running of up to 2500 hours for a single test was carried out to assess component reliability and various material/coating combinations. Results of cyclic running under agressive conditions suggest the need for two layer coating systems. The change from wrought Nimonic alloys to cast superalloys for turbine rotor blades has produced a marked increase in corrosion resistance, and to date, platinum aluminide has demonstrated best overall protection characteristics and can be standardized for production engines. D.L.G.

A82-35426 Heat transfer measurements of a transonic nozzle guide vane. M. R. Litchfield (National Gas Turbine Establishment, Farnborough, Hants., England) and R. J. G. Norton (Rolls-Royce, Ltd., Aero Div., Derby, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-247.* 10 p. 12 refs. Members, $2.00; nonmembers, $4.00.

The heat transfer and aerodynamic characteristics of a turbine nozzle guide vane with a supersonic exit velocity have been measured in a transient cascade facility. The vane possesses a convergent-divergent passage, and this, together with a low trailing edge wedge angle, is seen to control the supersonic flow efficiently at design conditions. Heat transfer measurements have been taken on both suction and pressure surfaces. On the suction surface, transition is marked by a rapid increase in heat transfer, whereas on the pressure surface a slow increase in heat transfer indicates the gradual onset of turbulence. The measurements also indicate possible relaminarisation of the suction surface boundary layer at the impingement of the trailing edge shock. Predictions are presented of aerodynamic flow, using an inviscid time-marching calculation, and heat transfer, using a differential method applied to the vane surface. (Author)

A82-35429 # An advanced helicopter engine control system. A. F. Saunders (Dowty and Smiths Industries Controls, Ltd., Cheltenham, Glos., England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-250.* 12 p. Members, $2.00; nonmembers, $4.00.

A full-authority digital engine control and intelligent cockpit command box has been designed and developed in order to: (1) demonstrate continued improvement in IC technology, with its associated increases in computing power; (2) employ control laws more relevant to electronic control, thereby obviating precise fuel metering by a hydromechanical unit; and (3) significantly improve engine and system performance monitoring methods. The control system described has undergone successful engine tests with a GEM helicopter engine, and is scheduled to be tested in prototype form aboard a Lynx military helicopter. O.C.

A82-35430 # **An approach to software for high integrity applications.** W. C. Dolman and J. P. Parkes (Lucas Aerospace, Ltd., Birmingham, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-251.* 10 p. Members, $2.00; nonmembers, $4.00.

This paper outlines one approach taken in designing a software system for the production of high quality software for use in gas turbine control applications. Central to the approach is a special control language with its inherent features of visibility, reliability and testability, leading to a software system which can be applied to applications in which the integrity of the units is of prime importance. The structure of the language is described together with the method of application in the field of aircraft gas turbine control. The provision of documentation automatically is an integral part of the system together with the testing procedures and test documentation. A description of how these features are combined into the total software system is also given. (Author)

A82-35432 # **Ceramic components for automotive and heavy duty turbine engines - CATE and AGT 100.** H. E. Helms and J. A. Byrd (General Motors Corp., Detroit Diesel Allison Div., Indianapolis, IN). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-253.* 10 p. 9 refs. Members, $2.00; nonmembers, $4.00.

Detroit Diesel Allison is actively applying advanced ceramic materials to components in gas turbine engines. Silicon carbide, silicon nitride, aluminum silicate, lithium aluminum silicate, and mullite are materials being used in various components in both the DDA GT 404-4 and AGT 100 engines. Approximately 9400 hr of ceramic component operating time in the GT 404 engine has been accumulated, and design, component processing, proof testing, and engine testing experience have begun to show the applicability of ceramic materials in production engines. Material variability, processing procedures, strength characterization, and nondestructive evaluations are emerging as critical but controllable factors. Ceramic components offer the potential of significant fuel consumption improvements in gas turbine engines for vehicles and other applications. (Author)

A82-35433 # **The influence of engine characteristics on patrol aircraft life cycle cost optimization.** A. J. Schuetz (Lockheed-California Co., Burbank, CA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-256.* 6 p. Members, $2.00; nonmembers, $4.00.

Peacetime utilization is postulated in an estimation of the engine duty cycle of a novel, land-based patrol aircraft, whose propulsion system incorporates high-speed turboprop engines and whose flight profile is that of the antisubmarine mission. It is determined that, where aircraft design has been optimized for minimum takeoff gross weight and life cycle costs, performance requirements and design constraints circumscribe the optimization process to the extent that the same point design is obtained for the takeoff weight and life cycle cost criteria. Engine cost contribution to overall life cycle costs is examined, and the sensitivity of aircraft optimization to such aircraft characteristics as specific fuel consumption, length, diameter and cost is analyzed. It is found that specific fuel consumption is the most significant engine characteristic. O.C.

A82-35436 # **Cycle considerations for tactical fighters in the early 1990's.** H. D. Snyder (United Technologies Corp., Pratt and Whitney Aircraft Group, West Palm Beach, FL). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-259.* 5 p. 6 refs. Members, $2.00; nonmembers, $4.00.

The possibility of a new tactical fighter for the 1990s is considered, and various aspects of such a fighter are discussed, including maneuverability, avionics, takeoff and landing, observables, supersonic persistence, and range. A probable peacetime training syllabus is set out. It is concluded that a jet cycle is preferable than a fan cycle in such an aircraft, and that combustor inlet temperatures will be increased for maneuverability and supersonic persistence. The overall engine pressure ratio will be moderate (18-22) and the engine pressure ratio will be high (3.5-4.5). The engine will probably have a two-dimensional reversing/vectoring nozzle and the radar cross section of the inlet will be reduced. A longer engine development cycle will be necessary to improve engine capability, while also improving operability, reliability, and maintainability. C.D.

A82-35446 # **Performance improvement features of General Electric turbofan engines.** D. J. Lennard and W. A. Fasching (General Electric Co., Cincinnati, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-270.* 7 p. 10 refs. Members, $2.00; nonmembers, $4.00.

Turbofan engine performance improvement features are presented, for engines already in operation and those currently undergoing development, with attention to fuel consumption reduction. Several of the performance improvement features incorporated have emerged from the NASA Engine Component Improvement program, and include fan, compressor, and high and low pressure turbine clearance modifications. Fan and exhaust nozzle aerodynamics improvements, reduced flowpath losses, and high efficiency turbine cooling are discussed. The evolutionary process of feature incorporation has yielded a specific fuel consumption improvement in the CF6-80C engine of 8% over the original CF6-50 design. O.C.

A82-35447 * # **Interim review of the Energy Efficient Engine /E3/ Program.** W. B. Gardner, W. Hannah, and D. E. Gray (United Technologies Corp., Commercial Products Div., East Hartford, CT). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-271.* 10 p. 12 refs. Members, $2.00; nonmembers, $4.00. NASA-sponsored research.

The NASA-sponsored Energy Efficient Engine (E3) Program, which is now in its fourth year, is assessed from the viewpoint of one of its research contractors. Attention is given to the development status of the shroudless fan, segmented combustor and exhaust mixer components which are encompassed by the program. The shroudless fan blades are two-thirds hollow for lightness, and are fabricated by means of plies and cores subjected to hot isostatic pressing diffusion bonding. The combustor's segmented liner is cast from turbine blade materials. Exhaust mixer flow visualization tests are described. Consideration is given to the effects of integrating the technology described with the low and high pressure advanced turbines whose development is also part of the E3 program. O.C.

A82-35448 * # **NASA ECI programs - Benefits to Pratt and Whitney engines.** W. O. Gaffin (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-272.* 8 p. 5 refs. Members, $2.00; nonmembers, $4.00. NASA-sponsored research.

Proprietary research conducted under the NASA-sponsored Engine Component Improvement program is shown to have advanced the state of such component technologies as thermal barrier coatings, ceramic seal systems, advanced turbine clearance control, and JT9D engine fan design. In addition, the tests conducted have demonstrated the advantages of updated cooling, sealing and aerodynamic designs in the high pressure turbine and compressor of the JT9D engine. These technological advances are being transferred to such novel engine configurations as the PW2037 and NASA Energy Efficient Engine. Attention is given to the results of the thermal coating refinement tests of convectively cooled vanes, and to the development of a single shroud fan design applicable to the JT9D and next-generation engines. O.C.

A82-35450 * # **Progress in the development of energy efficient engine components.** R. W. Bucy (General Electric Co., Cincinnati, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-275.* 7 p. 8 refs. Members, $2.00; nonmembers, $4.00. Contract No. NAS3-20643.

Component test results are presented for the NASA Energy Efficient Engine program, whose design goals relative to the CF6-50C reference engine include a 12% reduction in specific fuel consumption, 5% reduction in direct operating costs, and 50% reduction in specific fuel consumption deterioration rate over the course of commercial service. Emphasis is placed on the engine's high pressure compressor, which has a design pressure ratio of 23:1, and has completed a series of component tests whose resulting configuration is expected to meet all major objectives of the program. Descriptions are given of the core engine and integrated core/low spool tests, and system test benefits are discussed. Attention is given to the design features of the engine's double annular combustor, high and low pressure air turbines, and scale model exhaust mixer. O.C.

A82-35453 # **Material and process impact on aircraft engine designs of the 1990's.** R. A. Sprague (GE Material and Process Technology Laboratories, Cincinnati, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-278.* 10 p. Members, $2.00; nonmembers, $4.00.

Major material and process technology areas are discussed in terms of their impact on future engine performance. Airfoil materials development will concentrate on enhancing high temperature mechanical properties. New single-crystal or eutectic alloys, and overlay and/or thermal barrier coatings will permit increases of up to 250 F in allowable metal temperature capability. Increases in turbine inlet temperature and the desire to reduce engine weight and life cycle costs will drive disk material development toward attainment of higher tensile, creep, and fatigue strengths through development of dual-property disks, which combine new alloy compositions with novel processing techniques, and by increased application of polymeric composites. Rapid solidification plasma deposition technology promises to permit fabrication of complex, multialloy structural parts with improved mechanical properties and environmental resistance. Definition of new laboratory testing procedures and analyses will lead to better management of life cycle costs through enhanced materials utilization. C.D.

to improve a NASTRAN model of the AH-1G airframe. The calculated forces were applied to the improved NASTRAN Analytical model and the predicted accelerations were in agreement with accelerations measured on the AH-1G airframe in flight. G.R.

A82-37783 * # Design and evaluation of a state-feedback vibration controller. R. W. Du Val (NASA, Ames Research Center, Moffett Field, CA), C. Z. Gregory, Jr., and N. K. Gupta (Integrated Systems, Inc., Palo Alto, CA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-10.* 14 p.

The effectiveness and practicality of the state-feedback vibration controller is demonstrated by computer simulations. It is shown that: (1) the required measurements can be reduced to fuselage accelerations; (2) the system is stable over a wide range of flight conditions; (3) a discrete design for the controller provides effective digital implementation at 80-Hz sampling; (4) attenuation produced by the actuators does not create a problem, and a simple lead compensator provides vibration reduction; and (5) a design based on a hover model worked well at five knots. At 40 and 120 knots, vibrations in all but the vertical acceleration were effectively suppressed. The state-feedback vibration controller has a rapid convergence time and implementation is easier than with multicyclic control since no on-line harmonic analysis or identification algorithms are required. C.D.

A82-37784 Rotor state estimation for rotorcraft. J. W. Fuller. *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-11.* 10 p. 8 refs.

Studies of rotor control indicate that helicopter ride quality in gusty conditions can be significantly improved if rotor state feedback is used in an automatic flight controller. The present investigation is concerned with the design of an algorithm for estimating tip-path plane (TPP), and TPP rate for use in a feedback controller, given blade flapping measurements. The presence of the direct rotor measurements means that the estimator does not need to rely on detailed knowledge of helicopter and rotor dynamics. Therefore, a simple model of rotor dynamics is used. One problem still remains. The measurement equations, relating the measurements to the TPP states, are periodically time-varying. Current steady-state estimator synthesis techniques require time-invariant system equations. This problem is solved by analytically determining a coordinate transformation which converts the system equations to time-invariant forms. G.R.

A82-37785 * A simple system for helicopter individual-blade-control and its application to stall-induced vibration alleviation. N. D. Ham and T. R. Quackenbush (MIT, Cambridge, MA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-12.* 10 p. NASA-sponsored research.

A new, advanced type of active control for helicopters and its application to a system for stall flutter suppression is described. The system, based on previously developed M.I.T. Individual-Blade-Control hardware, employs blade-mounted accelerometers to sense torsional oscillations and feeds back rate information to increase the damping of the first torsion mode. A linear model of the blade and control system dynamics is used to give qualitative and quantitative guidance in the design process as well as to aid in analysis of experimental results. System performance in wind tunnel tests is described and evidence is given of the system's ability to provide substantial additional damping to stall-induced blade oscillations. (Author)

A82-37786 * # Considerations of open-loop, closed-loop, and adaptive multicyclic control systems. I. Chopra (NASA; Stanford Joint Institute for Aeronautics and Acoustics; Stanford University, Stanford, CA) and J. L. McCloud, III (NASA, Ames Research Center, Moffett Field, CA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-13* 23 p. 8 refs.

Four different types of self-tuning regulators were studied for multicyclic control of helicopter vibration. A numerical simulation of the helicopter is made, using a multivariable frequency-domain model, in terms of transfer function with six input control harmonics and six output harmonics. The model characteristics vary with flight speed. An off-line identification of model characteristics is made, using the least-squared-error method and using a succession of input and output measurements. The on-line identification of model characteristics is made using the Kalman filter solution. The optimal controls are calculated from the minimization of quadratic performance function based on response and multicyclic inputs. The performance of various regulators or controllers is judged from the stability, transient response, convergence time, and amplitude of the steady state. C.D.

A82-37787 Total main rotor isolation system. D. R. Halwes (Bell Helicopter Textron, Fort Worth, TX). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-15.* 8 p.

An analytical study is described in which six LIVE (Liquid Inertia Vibration Eliminator) isolator elements are combined to establish the requirements, preliminary design, and verification procedures for a total main rotor isolation system at n/rev. This approach provides the high potential for total isolation in all degrees of freedom necessary for any type rotor system without excessive weight and complexity. The LIVE system has numerous advantages over mechanical inertia isolators, including reduced complexity, no bearings, a smaller envelope for installation, linear response at high g's, and much lower weight and cost. Analysis of the system after installation in a 206 LM helicopter showed better than 95% isolation for a weight penalty of less than 3/4% of design gross weight. N.B.

A82-37788 Flight demonstration of an integrated floor/fuel isolation system. R. Gabel, P. Teare, and R. A. Desjardins (Boeing Vertol Co., Philadelphia, PA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-16.* 11 p.

A vibration isolation system has been developed for the passenger cabin and the long range fuel tanks of the Boeing Commercial Chinook. The passenger floor is isolated from the airframe on a series of passive isolation units. The fuel tanks are also isolated so that their varying dynamic mass is effectively nulled at all fuel levels, thereby avoiding any deleterious effects on airframe natural frequency placement. Analyses, component tests, an aircraft shake test and now flight tests have verified the effectiveness of the system. Passenger cabin vibration levels are below 0.05 g at the 135 knot cruise speed and beyond. These flight vibration levels are insensitive to fuel quantity, despite variation from 14,000 lb down to reserve. (Author)

A82-37789 Semi-active fluid inertia - A new concept in vibration isolation. D. L. Margolis (California, University, Davis, CA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-17* 14 p. 10 refs.

A vibration isolation system which features semi-active control of fluid inertia for broad-band applications on helicopter rotor inputs is described. Semi-active control theory is reviewed, along with the skyhook concept in a continuously variable configuration. The fluid inertia based isolator is modeled numerically, noting that the use of a variable orifice and a control strategy presents a nonlinear control problem. The actual proposed device consists of a cylinder of fluid with a piston, connected by means of a long tube to some mass. The fluid-filled tube is an effective mass which provides isolation performance from, for example, helicopter downwash. Modulating the orifice in the tube allows the semi-active control. Applications during take-off and landing phases of flight, when variable engine speeds are encountered, are indicated. M.S.K.

A82-37790 Assessment of the dynamic response of a structure when modified by the addition of mass, stiffness or dynamic absorbers. S. P. King (Westland Helicopters Ltd., Yeovil, Somerset, England). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-18.* 10 p.

An algorithm suitable for estimating the modes and frequencies created by the introduction of reconfigured fuselages and mass spring systems to a new helicopter during the design and development phases is presented. The new modes are expressed as linear combinations of known modes and the degree of coupling resulting from the projected structural changes can be assessed. Application of the algorithm for the case of added stiffness is made, along with examples of added mass or an absorber. It is shown that the model is useful for examining the effects of varying the same parameter and also for determining the additive effects of a number of structural modifications. Comparison with the outcome of an eigenvalue analysis shows good agreement for a 39 degree of freedom two-dimensional lumped parameter model, with the algorithm underestimating the frequency reduction. M.S.K.

A82-37791 Monofilar - A dual frequency rotorhead absorber. T. Mouzakis (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-20.* 9 p.

A monofilar absorber is centrifugally tuned two degree of freedom device which reacts and reduces vibratory forces at two frequencies using a single active mass. A mathematical model of the monofilar is presented together with both linear and nonlinear equations of motion. It is shown that the desired natural frequencies (3P and 5P for a four bladed rotor) can be obtained with physically achievable mass, inertia and geometric properties and that the performance of the monofilar is equivalent to that of a standard bifilar. Therefore, the monofilar absorber design will allow reductions in weight, parts, maintenance and production costs, relative to the conventional bifilar absorber. (Author)

A82-37792 # A finite element analysis of coupled rotor fuselage vibration. M. J. Rutkowski (U.S. Army, Aeromechanics Laboratory, Moffett Field, CA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-21.* 15 p. 6 refs.

The dynamic coupling between the rotor system and the fuselage of a simplified helicopter model in hover is investigated. The rotor-fuselage model is based on a two-degrees-of-freedom beam finite element with polynomial mass and stiffness properties. The linear matrix equations of motion for the system include centrifugal stiffness and quasi-steady aerodynamic damping matrices for the rotor elements and structural damping matrices for both rotor and fuselage elements. Both real and complex eigenanalyses are carried out to obtain mode shapes and modal frequencies as a function of rotor speed. Forced-response vibration results for the case of a radially uniform, harmonic load applied to the rotor are also described. The uncoupled rotor-fuselage frequencies in vacuo are poor approximations to the actual coupled frequencies near rotor-fuselage frequency coalescence, but including rotor aerodynamic design provides some improvement. The magnitude of the resonant response at the fuselage mode frequencies is highly dependent on their proximity to the blade mode frequencies. C.D.

A82-37793 * **A unified approach to helicopter NASTRAN modeling.** J. J. Brown, R. A. Christ, K. L. Kilroy, and G. R. Parker (Hughes Helicopters, Inc., Culver City, CA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-22.* 8 p.

An approach unifying stress and dynamics analysis is presented. A common stress model is employed along with an automated method of assembling the mass data, and a variation of the subspace iteration technique is used to reduce the dynamic equations, resulting in timely, economical turnaround of any design changes and elimination of the problems associated with the use of two models. The dynamics group adds mass data to the stress model to form the dynamic model, while the structures department develops and maintains a common NASTRAN bulk data base accessed by both groups. The basic model supplies the stiffness data to predict internal loads for the stress analyst and to calculate modal data for the dynamicist. Structural and nonstructural mass data are processed separately before being combined and added to the stiffness model to produce the dynamic model. Application to the AHIP aircraft is demonstrated. C.D.

A82-37794 # **A nonlinear response analysis for coupled rotor-fuselage systems.** D. L. Kunz (U.S. Army, Aeromechanics Laboratory, Moffett Field, CA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-23.* 22 p. 11 refs.

The governing equations for a fully coupled, rotor-fuselage vibration model are derived. There are three sets of equations involved. First are the equations of motion for a uniform, elastic blade that can undergo flap and lead-lag bending deflections. The second set of equations comprises the hub-load equations. For both the blade and hub-load equations, the aerodynamic forces are derived from quasi-steady strip theory. In modeling the fuselage, beam finite-elements and generalized isolator elements are used to generate the third set of equations, the fuselage equations of motion. The blade and fuselage responses, as well as the hub loads, are computed by an iterative, combined harmonic-balance, impedance-matching method. In addition, the uncoupled blade and fuselage modes and frequencies, which are by-products of the blade and fuselage analyses, and the coupled system natural frequencies may be obtained. (Author)

A82-37795 * **Substructure program for analysis of helicopter vibrations.** R. Sopher (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-24.* 21 p. 12 refs. Contract No. NAS1-16058.

A substructure vibration analysis which was developed as a design tool for predicting helicopter vibrations is described. The substructure assembly method and the composition of the transformation matrix are analyzed. The procedure for obtaining solutions to the equations of motion is illustrated for the steady-state forced response solution mode, and rotor hub load excitation and impedance are analyzed. Calculation of the mass, damping, and stiffness matrices, as well as the forcing function vectors of physical components resident in the base program code, are discussed in detail. Refinement of the model is achieved by exercising modules which interface with the external program to represent rotor induced variable inflow and fuselage induced variable inflow at the rotor. The calculation of various flow fields is discussed, and base program applications are detailed. C.D.

A82-37796 * **Determination of rotor wake induced empennage airloads.** S. T. Gangwani (United Technologies Research Center, East Hartford, CT). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-26.* 16 p. 10 refs. Army-supported research; Contract No. NAS1-16058.

A computer program has been developed that predicts the unsteady aerodynamic forces that impinge on the empennage surface due to its interactions with the main rotor wake. The program was utilized to determine the vibration airloads acting on the Black Hawk horizontal stabilizer and on the CH-53A stabilizer under high speed forward flight conditions. The results demonstrate that it is possible to compute the high frequency empennage vibration airloads efficiently by utilizing suitable analysis techniques; a CH-53A case required only 1.3 minutes of computer time. Numerical problems associated with the unsteady Kutta condition have been minimized. Even though the analysis is of transient nature, the results for harmonic cases show a very fast convergence to periodicity. In general, good correlation was shown between the predicted vibratory airloads and the measured stabilizer airloads for a CH-53A helicopter operating at high speed flight conditions. C.D.

A82-37797 **Use of optimization in helicopter vibration control by structural modification.** G. T. S. Done (City University, London, England). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-27.* 8 p. 7 refs. Research sponsored by Westland Helicopters Ltd., and Royal Aircraft Establishment.

A method is described of computing the structural changes necessary to reduce the vibration in part of a helicopter fuselage subject to a constant frequency excitation at the rotor head. The method is applied to a simple two-dimensional 60 degree of freedom model. A number of structural parameters considered suitable candidates for change are selected, and then values of these parameters are computed using an optimization routine such that a function involving the response over part of the structure is minimised. The results provide the basis for useful discussion on various aspects of the selection and optimization exercises. (Author)

A82-37832 # **The DC-10 Chicago crash and the legality of SFAR 40.** G. Richard. In: Annals of air and space law. Volume 6. (A82-37826 18-84) Montreal, McGill University; Toronto, Carswell Co., Ltd.; Paris, Editions A. Pedone, 1981, p. 195-218. 42 refs.

Legal issues arising out of the invocation of SFAR 40 after the 1979 crash of a DC-10 passenger aircraft are discussed in terms of the effects on international agreements and on the Chicago convention. The decision, made by the head of the U.S. agency, the FAA, grounded all foreign and domestic flights of DC-10s in the U.S., thus extending sovereign jurisdiction to aircraft owned by other nations and/or foreign companies. Standards for airworthiness established by the ICAO in signing the multinational Chicago Convention agreements are reviewed, and it is noted that empty foreign DC-10 aircraft were allowed to fly over the U.S. after the decision. It is concluded that the decision to invoke the SFAR 40 provision was not legally sound because the head of the FAA had no jurisdiction over DC-10 aircraft under foreign registry. M.S.K.

A82-37857 **Wear by generation of electrokinetic streaming currents.** T. R. Beck (Electrochemical Technology Corp., Seattle, WA). *American Society of Lubrication Engineers, Annual Meeting, 37th, Cincinnati, OH, May 10-13, 1982, Preprint 82-AM-6A-3.* 6 p. 16 refs.

Hydraulic control valves in commercial aircraft are subject to 'erosion' in service with phosphate ester fluids, due to corrosion from generation of electrokinetic streaming currents. This 'zeta corrosion' phenomenon is now well understood. The theory is extended here to calculate current densities that would be generated on the surfaces of lubricated journal bearings and roller bearings. Measurements of such current densities made with a disk electrode in a simulated journal bearing are in approximate agreement with the model. Many aspects of bearing wear reported in the literature are consistent with the zeta corrosion mechanism. (Author)

AN ANALYTICAL STUDY OF TURBULENCE RESPONSES, INCLUDING HORIZONTAL TAIL LOADS, OF A CONTROL CONFIGURED JET TRANSPORT WITH RELAXED STATIC STABILITY M.S. Thesis
Boyd Perry, III 17 Feb 1975 122 p refs
Avail NTIS HC A06/MF A01

The turbulence responses of control configured vehicles (CCV) with relaxed static stability (RSS) are discussed. Three similar vehicle configurations employing two types of static stability augmentation systems (SSAS) at two flight conditions (two Mach numbers at constant altitude are considered. The configurations include a baseline (statically stable) configuration and two representative CCV (statically unstable) configurations, featuring one with baseline geometry and one with a significantly reduced horizontal tail. Stability, flying qualities, and maneuverability requirements are imposed on the airplane-SSAS systems and denote representative requirements imposed on a CCV with RSS. Using these requirements as a common base, the rigid airframe and tail load turbulence responses are examined in terms of configuration changes for a given SSAS and in terms of SSAS changes for a given configuration. Turbulence response calculations for each SSAS indicate that even though the tail load responses for the unstable configuration with the small tail are less than those for the stable configuration, the tail loads per unit tail volume are larger. FLIGHT EXPERIMENTS USING THE FRONT-SIDE CONTROL TECHNIQUE DURING PILOTED APPROACH AND LANDING IN A POWERED LIFT STOL AIRCRAFT
W. S. Hindson (National Research Council of Canada), G. H. Hardy, and R. C. Innis Apr. 1982 87 p refs
(NASA-TM-81337; A-8777; NAS 1.15:81337; FRL-TR-LTR-FR-81) Avail: NTIS HC A05/MF A01 CSCL 01C

The essential features of using pitch attitude for glidepath control in conjunction with longitudinal thrust modulation for speed control are described, using a simple linearized model for a powered-lift STOL aircraft operating on the backside of the drag curve and at a fixed setting of propulsive lift. It is shown that an automatic speed-hold system incorporating heave-damping augmentation can allow use of the front-side control technique with satisfactory handling qualities, and the results of previous flight investigations are reviewed. Manual control considerations, as they might be involved following failure of the automatic system, are emphasized. The influence of alternative cockpit controller configurations and flight-director display features were assessed for their effect on the control task, which consisted of a straight-in steep approach flown at constant speed in simulated instrument conditions. LATERAL CONTROL SYSTEM DESIGN FOR VTOL LANDING ON A DD963 IN HIGH SEA STATES M.S. Thesis
Marc Bodson May 1982 221 p refs
(Grant NGL-22-009-124)
(NASA-CR-169074; NAS 1.26:169074; LIDS-TH-1209) Avail: NTIS HC A10/MF A01 CSCL 01C

The problem of designing lateral control systems for the safe landing of VTOL aircraft on small ships is addressed. A ship model is derived. The issues of estimation and prediction of ship motions are discussed, using optimal linear linear estimation techniques. The roll motion is the most important of the lateral motions, and it is found that it can be predicted for up to 10 seconds in perfect conditions. The automatic landing of the VTOL aircraft is considered, and a lateral controller, defined as a ship motion tracker, is designed, using optimal control techniqes. The tradeoffs between the tracking errors and the control authority are obtained. The important couplings between the lateral motions and controls are demonstrated, and it is shown that the adverse couplings between the sway and the roll motion at the landing pad are significant constraints in the tracking of the lateral ship motions. The robustness of the control system, including the optimal estimator, is studied, using the singular values analysis. Through a robustification procedure, a robust control system is obtained, and the usefulness of the singular values to define stability margins that take into account general types of unstructured modelling errors is demonstrated. The minimal destabilizing perturbations indicated by the singular values analysis are interpreted and related to the multivariable Nyquist diagrams. Author

INVESTIGATION OF AN IMPROVED STRUCTURAL MODEL FOR DAMAGED T-38 HORIZONTAL STABILIZER FLUTTER ANALYSIS USING NASTRAN M.S. Thesis
Lex Clayton Dodge Dec. 1981 62 p refs
(AD-A111095; AFIT/GAE/AA/81D/6) Avail: NTIS HC A04/MF A01 CSCL 01/1

This thesis investigates tuning a finite element model and applying the procedures to the T-38 horizontal stabilizer for use on NASTRAN. The T-38 stabilizer model is to be used in a subsequent flutter analysis. Static and dynamic analysis has shown the model to have inadequate bending and torsional stiffness. The model was tuned in the frequency domain with free-free boundary conditions. The tuned frequencies and mode shapes show good correlation to the measured values. The finite element model was shown to not contain variables that significantly influence the torsion modes frequencies more than the bending frequencies. Eigenvalue analysis of the tuned model with aircraft installed boundary conditions produced good results for all but the first torsion frequency. This frequency was tuned by increasing the model's control system stiffness. This tuned model produces good frequencies and mode shapes. Additional investigation is needed to compare the dynamic model corrections to the static model corrections found by Jack Sawdy, AF IT/GAE/AA/81D-27. Author (GRA)

MINIMUM TIME TURNS CONSTRAINED TO THE VERTICAL PLANE M.S. Thesis
Christopher S. Finnerty Dec. 1981 77 p refs
(AD-A111096; AFIT/GAE/AA/81D-7) Avail: NTIS HC A05/MF A01 CSCL 01/2

The objective of this study is to find the throttle controls and trajectories which yield the minimum turning times for a high performance aircraft with thrust reversal capability. The aircraft remains in the vertical plane allowing only pull-up and split-s maneuvers. A second-order parameter optimization method coupled with the suboptimal control approach is used to solve the minimum time-to-turn problem. The results of the study found that trajectories restricted to the vertical plane gave different results, and in at least one case better results, than those not so constrained. The results also indicate that depending on the maneuver performed, thrust reversal is beneficial in reducing the minimum time-to-turn regardless of whether the aircraft's initial velocity is above or below corner speed. Finally, the results demonstrate that thrust reversal can be utilized for minimum time turns with resulting increases in specific energy. GRA

USE OF ENTIRE EIGENSTRUCTURE ASSIGNMENT WITH HIGH-GAIN ERROR-ACTUATED FLIGHT CONTROL SYSTEMS M.S. Thesis
Darrell Brett Ridgely Dec. 1981 155 p refs
(AD-A111098; AFIT/GAE/AA/81D-24) Avail: NTIS HC A08/MF A01 CSCL 01/3

The theory of high-gain error-actuated feedback control, developed by Porter and Bradshaw, was applied to the design of various longitudinal decoupling flight control systems for an advanced aircraft. The controllers developed in this study utilized output feedback with proportional plus integral control to produce desirable closed-loop response with minimal interaction between outputs. This report describes how entire eigenstructure assignment can be used to determine appropriate measurement equations by assigning their corresponding transmission zeros. A singular value decomposition was used to choose the eigenvectors from their permissible subspaces. The results show that these modes appear in the output response, even for very high gain. Therefore, selection of good eigenvalues/eigenvectors was shown to be crucial to the successful application of this theory. This report also examined the effect of varying the other design parameters on the closed-loop system response. GRA

INTEGRATED FLIGHT TRAJECTORY CONTROL Final Report, Aug. 1979 - May 1981

Gregory L. Comegys and Garrett R. Hanson Wright-Patterson AFB, Ohio AFWAL Aug 1981 151 p refs
(Contract F33615-79-C-3624; AF Proj. 2403)
(AD-A110998; ID-01R-0481; AFWAL-TR-81-3077) Avail: NTIS HC A08/MF A01 CSCL 01/3

IPTC programs demonstrated by simulation the ability to compute four dimensional reference trajectories and provide guidance commands to the pitch and role autopilot axes for vertical and lateral aircraft control, and to the autothrottle for thrust and accurate time of arrival control. The ability of the trajectory generator to respond to pilot induced flight plan deviations and data linked mission changes was also demonstrated. Conventional cathode ray tubes (CRTs) were utilized for flight plan graphics and alphanumeric display. The IFTC Development Program was concerned with adding certain functions to increase the tactical flight management capabilities of the concept. IFTC was integrated with the Firefly II advanced air to ground weapon delivery algorithms to provide ingress and egress flight path generation and control. The LSI developed Mission Data Transfer System (MDIS) was added to the simulation to demonstrate the aid to mission planning and the rapid data initialization of the simulated airborne system. SIMULATION REPORT: ADVANCED DISPLAY FOR COMPLEX FLIGHT TRAJECTORIES Final Report, Jun. - Oct. 1980

Peter B. Lovering, Debra A. Warner, Deborah K. Park, Matthew Miller, and Stuart B. Burdess (AFWAL) Wright-Patterson AFB, Ohio AFWAL Jun. 1981 72 p refs
(Contract F33615-78-C-3614; AF Proj. 2403)
(AD-A111259; AFWAL-TR-81-3057) Avail: NTIS HC A04/MF A01 CSCL 01/2

Several cockpit display problems were revealed during flight tests of complex approach trajectories in support of the Microwave Landing System (MLS) Program. Among these problems were pilot orientation with respect to the approach profile and the runway, verifying proper performance along the prescribed path and cross-checking or monitoring profile computations. This document contains a brief background statement regarding the display and describes the simulator experiment, results and recommendations for display improvement. In all, eight rated Air Force Pilots of varying backgrounds flew approximately 264 curved, multi-segmented glideslope approaches in a variety of simulated wind conditions. Data collection included objective performance with respect to the desired flight path and pilot opinion on each of the new display features. Generally, pilots were favorably impressed with the display concept and recommended further development. GRA

MAINTENANCE TRAINING SIMULATOR DESIGN AND ACQUISITION: HANDBOOK OF ISB PROCEDURES FOR DESIGN AND DOCUMENTATION Interim Report, Mar. 1979 - Mar. 1980

Rohn J. Hritz, Hobart J. Harris, Jennifer A. Smith, and George R. Purifoy, Jr. Brooks AFB, Tex. AFHRL Feb. 1982 215 p
(Contract F33615-78-C-0019; AF Proj. 2361)
(AD-A111430; AFHRL-TP-81-51) Avail: NTIS HC A10/MF A01 CSCL 05/9

This technical paper presents a method for deriving training requirements, selecting an approach for meeting the training objectives identified, and making training equipment fidelity and instructional feature design decisions where training hardware is needed. The procedures supplement existing materials (AFP 50-58, and the 3306th Test and Evaluation Squadron Procedural Handbook, Edwards AFB) by clarifying existing training technology and providing new procedures to assist the ISD analyst in designing and documenting training equipment. The handbook expands upon currently used procedures in three major decision areas. These are (a) determining which training requirements require hardware or training equipment of some type, (b) selecting the degree of fidelity with which to represent components and parts on the training equipment, and (c) choosing instructional features to be incorporated in the training equipment. All procedures use decision flow charts to increase objectivity. The method results in documentation that is to be used as a basis for completing the ISD-Derived Training Equipment Design. The design is then communicated to the Simulator System Program Office (SimSPO) for use in preparing procurement specifications to contractors. Author (GRA)

PERFORMANCE OF THE AEDC MARK 1 AEROSPACE ENVIRONMENTAL CHAMBER WITHOUT OIL DIFFUSION PUMPING Final Report

W. B. Stephenson and R. E. Alt Feb. 1982 28 p refs
(AD-A111406; AEDC-TR-81-32) Avail: NTIS HC A03/MF A01 CSCL 14/2

The 40- by 80-ft MK-I Aerospace Environmental Chamber was pumped down to a pressure of 2 x 10 to the minus 6th power torr in order to verify an operational mode that could maintain test conditions without the use of oil diffusion pumping. Mechanical pumps rough pumped into the micron (1 to 10.0 x 10 to the minus 3rd power torr) range, and the cryogenic arrays reduced the pressure to 2 x 10 to the minus 6th power torr and maintained it for 24 hours. The pumpdown without the use of diffusion pumping is often dictated by test requirements for exceptional cleanliness. After pumpdown, inbleeding of CO2, H2, and N2 affected chamber pressure as a function of gas species and inflow rate. The time for the liquid nitrogen and gaseous helium-cooled cryosurfaces to cool down and warm up was determined as an aid to test planning. Because several modifications to the cryopumping geometry had been made since the chamber was initially placed into service, it was considered important to verify the MK-I performance. It is concluded that the mechanical roughing/cryogenic pumping method of operation is satisfactory for simulation of conditions where the outgassing is relatively small or consists of gases with low vapor pressure at liquid nitrogen temperature (i.e., CO2 or H2O). OPTIMAL PLACEMENT MODEL FOR THE B-52G WEAPONS SYSTEM TRAINER M.S. Thesis

Franklin E. Hoke, Jr. Sep. 1981 79 p refs
(AD-A110977; AFIT/LSSR-83-81) Avail: NTIS HC A05/MF A01 CSCL 15/5

As a result of the Force Modernization Study, the Strategic Air Command will have its first new generation simulator, the Weapons System Trainer (WST), available in the beginning of 1982. Because of the highly intensive requirements of B-52 training, it had been determined that each B-52 unit would be equipped with a total WST system. While there is agreement with the strategic implications of individual base location for the WST, the necessity of that decision should be questioned. The original research question directed at G model bases was: Can an economically optimum location scheme be determined for the minimum number of WST's necessary to meet training requirements? Consequently, the central objective of this research was the development of a mathematical model which would assure the optimum placement of the WST based on the defined resources, constraints, and economic criteria. The research and generated solutions lend credence to the model as a management tool, in that it permits an objective analysis of alternatives in terms of cost location schemes and number of simulators. It is concluded that the model should provide useful information in future simulator location studies. Author (GRA)

FINAL REGULATORY EVALUATION: METROPOLITAN WASHINGTON AIRPORTS POLICY Final Report

Lawrence A. Pearsall and Douglas A. Samuelson Oct. 1981 187 p refs
(AD-A110583; FAA-APO-81-12) Avail: NTIS HC A09/MF A01 CSCL 01/2

This final regulatory evaluation examines the potential impacts of rules to be applied to aircraft operations at Washington National Airport. These rules are part of the overall policy toward the development of Washington National Airport and Dulles International Airport. The alternative economic impacts on airlines, passengers, communities and the FAA of imposing passenger ceilings, operations quotas, landing fees, perimeter rules, curfews, and noise restrictions under various scenarios are assessed in this evaluation, and the final rule is specifically addressed in the final Chapter. The quantifiable impacts of this rule are estimated at a $27 million net cost to society, but this net cost is believed to be outweighed by benefits which cannot be measured. Author (GRA)

near the walls. The axial location of the dilution air addition has no effect on the performance or stability. Results also indicate that the amount of secondary air entrained by the flameholder recirculation zone is dependent on the amount of dilution air and flameholder geometry. (Author)

A82-34993 # **Influence of airblast atomizer design features on mean drop size.** N. K. Rizk and A. H. Lefebvre (Purdue University, West Lafayette, IN). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1073.* 7 p. 15 refs.

Measurements of mean drop size, using the light-scattering technique, were carried out on eight different airblast atomizers. The liquids employed were water and kerosine. The test range included wide variations in atomizing air velocity, air pressure, and liquid and air flow rates, but the main objective was to examine the influence of scale and various design features on atomization performance. The results obtained show, for all types of airblast atomizer, that atomization quality is improved by increase in ambient air pressure, decrease in atomizer size, and by minimizing the angle of impact between the fuel jet and the high velocity air stream. (Author)

A82-34994 # **Numerical and experimental examination of a prevaporized/premixed combustor.** C. L. Proctor, II (Florida, University, Gainesville, FL) and A. M. Mellor. *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1074.* 11 p. 10 refs. USAF-sponsored research.

An experimental prevaporizing/premixing combustor configuration was examined numerically and experimentally. Non-reacting flow field calculations were made using the computer code 'CORA2'. Experimental evaluation of the combustor configuration was accomplished by extracting gas samples at discrete locations from within the combustor and analyzing them for unburned hydrocarbons (UHC), CO, CO2, and O2. These data were used to calculate local combustion efficiency and temperature. Contour plots were developed to interpret the gaseous flow field. Results indicate two distinct regions of combustion: one in the recirculation zone providing constant ignition of incoming air/fuel mixture, and another where vitiated air impinges on the burning air/fuel mixture downstream of the ignition source. (Author)

A full authority digital electronic control was selected for the Pratt and Whitney Aircraft PW2037 turbofan transport engine. This control system will provide optimum engine performance and fuel economy, high operational reliability, minimum pilot workload, simplified control maintenance procedures, and maximum engine protection. A general description of the system is presented and benefits are discussed. (Author)

A82-34997 * # **Development of a helicopter rotor/propulsion system dynamics analysis.** W. Warmbrodt (NASA, Ames Research Center, Moffett Field, CA) and R. Hull (Systems Control Technology, Inc., Palo Alto, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1078.* 16 p. 12 refs.

A time-domain analysis of coupled engine/drive train/rotor dynamics of a twin-engine, single main rotor helicopter model has been performed. The analysis incorporates an existing helicopter model with nonlinear simulations of a helicopter turboshaft engine and its fuel controller. System dynamic behavior is studied using the resulting simulation which included representations for the two engines and their fuel controllers, drive system, main rotor, tail rotor, and aircraft rigid body motions. Time histories of engine and rotor RPM response to pilot control inputs are studied for a baseline rotor and propulsion system model. Sensitivity of rotor RPM droop to fuel controller gain changes and collective input feed-forward gain changes are studied. Torque-load-sharing between the two engines is investigated by making changes in the fuel controller feedback paths. A linear engine model is derived from the nonlinear engine simulation and used in the coupled system analysis. This four-state linear engine model is then reduced to a three-state model. The effect of this simplification on coupled system behavior is shown. (Author)

A82-34998 # **Analysis of two-dimensional internal flows using a primitive-variable relaxation Navier-Stokes procedure.** R. K. Scharnhorst (McDonnell Aircraft Co., St. Louis, MO). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1083.* 10 p. 18 refs. Research supported by the McDonnell Aircraft Co.

Accurate and economic internal flow analysis procedures are needed for the efficient design of suitable diffuser and nozzles in advanced fighter aircraft engines. The largely empirical conventional approach used for the design of such components is inefficient and time-consuming, and it might fail to produce optimal design solutions. The present study is concerned with the latest stages in the development of a primitive-variable, relaxation Navier-Stokes solution procedure. A two-dimensional version was developed primarily to become familiar with the involved technique. A two-dimensional analysis procedure can provide information regarding valuable performance trends of preliminary diffuser and nozzle designs. The computational time required for the implementation of the considered procedure was found to be significantly less than that of classical time dependent approaches, and no difficulties have been encountered for separated flows. G.R.

A82-34999 * # **NASA Broad Specification Fuels Combustion Technology program - Pratt and Whitney Aircraft Phase I results and status.** R. P. Lohmann (United Technologies Corp., Commercial Products Div., East Hartford, CT) and J. S. Fear (NASA, Lewis Research Center, Aerothermodynamics and Fuel Div., Cleveland, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1088.* 12 p. 11 refs.

In connection with increases in the cost of fuels and the reduced availability of high quality petroleum crude, a modification of fuel specifications has been considered to allow acceptance of poorer quality fuels. To obtain the information upon which a selection of appropriate fuels for aircraft can be based, the Broad Specification Fuels Combustion Technology program was formulated by NASA. A description is presented of program-related investigations conducted by an American aerospace company. The specific objective of Phase I of this program has been to evaluate the impact of the use of broadened properties fuels on combustor design through comprehensive combustor rig testing. Attention is given to combustor concepts, experimental evaluation, results obtained with single stage combustors, the stage combustor concept, and the capability of a variable geometry combustor. G.R.

A82-35000 * # **NASA/General Electric broad-specification fuels combustion technology program - Phase I results and status.** W. J. Dodds, E. E. Ekstedt, D. W. Bahr (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH), and J. S. Fear (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1089.* 12 p. 14 refs.

A program is being conducted to develop the technology required to utilize fuels with broadened properties in aircraft gas turbine engines. The first phase of this program consisted of the experimental evaluation of three different combustor concepts to determine their potential for meeting several specific emissions and performance goals, when operated on broadened property fuels. The three concepts were a single annular combustor; a double annular combustor; and a short single annular combustor with variable geometry. All of these concepts were sized for the General Electric CF6-80 engine. A total of 24 different configurations of these concepts were evaluated in a high pressure test facility, using four test fuels having hydrogen contents between 11.8 and 14%. Fuel effects on combustor performance, durability and emissions, and combustor design features to offset these effects were demonstrated. (Author)

A82-35017 * # **In-flight acoustic results from an advanced-design propeller at Mach numbers to 0.8.** K. G. Mackall, P. L. Lasagna, K. Walsh (NASA, Ames Research Center, Edwards, CA), and J. H. Dittmar (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1120.* 9 p. 6 refs.

Acoustic data for the advanced-design SR-3 propeller at Mach numbers to 0.8 and helical tip Mach numbers to 1.14 are presented. Several advanced-design propellers, previously tested in wind tunnels at the Lewis Research Center, are being tested in flight at the Dryden Flight Research Facility. The flight-test propellers are mounted on a pylon on the top of the fuselage of a JetStar airplane. Instrumentation provides near-field acoustic data for the SR-3. Acoustic data for the SR-3 propeller at Mach numbers up to 0.8, for propeller helical tip Mach numbers up to 1.14, and comparison of wind tunnel to flight data are included. Flowfield profiles measured in the area adjacent to the propeller are also included. (Author)

A82-35018 * # **Interior noise considerations for advanced high-speed turboprop aircraft.** J. S. Mixson, F. Farassat, J. D. Leatherwood (NASA, Langley Research Center, Hampton, VA), R. Prydz, and J. D. Revell (Lockheed-California Co., Burbank, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1121.* 12 p. 25 refs.

This paper describes recent research on noise generated by high-speed propellers, on noise transmission through acoustically treated aircraft sidewalls and on subjective response to simulated turboprop noise. Propeller noise discussion focuses on theoretical prediction methods for complex blade shapes designed for low noise at Mach = 0.8 flight and on comparisons with experimental test results.

Noise transmission experiments using a 168 cm. diameter aircraft fuselage model and scaled heavy-double-wall treatments indicate that the treatments perform well and that the predictions are usually conservative. Studies of subjective comfort response in an anechoic environment are described for noise signatures having combinations of broadband and propeller-type tone components. (Author)

A82-35019 # An experimental investigation of S-duct diffusers for high-speed propfans. B. H. Little, Jr. and W. S. Trimboli (Lockheed-Georgia Co., Marietta, GA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1123.* 9 p.

Wind tunnel test results are presented for three propfan engine installation diffuser configurations of the S-duct type, of which two were single-scoop designs having diffuser inlet throat/diffuser exit area ratios of 1.0 and 1.25, and the third, wrap-around design had a 1.25 area ratio. Of the two diffusers with a 1.25 area ratio, the wrap-around design performed better than a shaft-penetrating S-duct in both pressure recovery and static pressure rise, although the thickening of the inlet boundary layer to simulate measured propfan test profiles produced a 2% loss in total pressure recovery and increased distortion parameters several-fold for this design. Duct cross-sectional area distribution discontinuities inherent in simple drive shaft geometries were found to have no effect on diffuser performance. O.C.

A82-35020 # Selecting the best reduction gear concept for prop-fan propulsion systems. J. Godston (United Technologies Corp., Commercial Products Div., East Hartford, CT) and J. Kish (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1124.* 12 p. 8 refs.

A study of reduction gearboxes for application to prop-fan propulsion systems is presented in which 10 different reduction gear configurations are considered. Attention is given to the definition of gearbox technical requirements and of the screening process used in the selection of the more promising concepts. A detailed presentation is made of two typical prop-fan propulsion systems, of which one incorporates an in-line and the other an offset reduction gearbox. The inline systems studied are the splined and integral split path, star/star, compound planetary, layshaft, and planetary/planetary. Offset systems include the spur/-star, spur/planetary, compound idler, and spur/spur. These are evaluated with respect to cruise efficiency, internal or external pitch control, reliability, maintainability, weight, cost, degree of risk, acoustics, and degrees of component contrarotation and ease of scaling. O.C.

A82-35021 # Optimization of propeller blade shape by an analytical method. L. K. Chang and J. P. Sullivan (Purdue University, West Lafayette, IN). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1125.* 6 p. 12 refs.

Based upon the vortex lattice method and nonlinear programming procedures, the problem of predicting the optimum propeller-blade shape has been formulated and solved by maximizing the propulsive efficiency under the constraint of constant power consumption. The predicted optimum propeller blades with tip devices (proplets) show an ideal efficiency improvement of 1-6%. Comparisons of the angle of twist distributions for the optimized and unoptimized propeller blades are presented. (Author)

A82-35022 # PMUX - The interface for engine data to AIDS. J. A. Bluish and W. Lorenz (Bendix Corp., Energy Controls Div., South Bend, IN). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1127.* 10 p.

The propulsion multiplexer (PMUX) unit, a new component of the Aircraft Integrated Data System (AIDS), promises to improve the accuracy and reduce the weight of condition-monitoring equipment in commercial engines. PMUX will improve accuracy by packaging advanced technology pressure sensors within the electronic unit and by using digital signal conditioning - made more practical by placing the microprocessor near the engine sensors. To reduce weight, the PMUX system will replace multiconductor cables with a serial digital data link. This paper discusses typical design requirements and describes the approach used in a PMUX unit designed for the 747 Extended Upper Deck (EUD) aircraft. (Author)

A82-35023 # Charting propulsion's future - The ATES results. A. Adams and S. Parkola (United Technologies Corp., Government Products Div., West Palm Beach, FL). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1139.* 10 p. 5 refs. Contract No. N00019-80-C-0225.

The Advanced Technology Engine Studies (ATES) program was conducted to establish a coordinated government/industry long range propulsion plan for new aircraft systems envisioned through the year 2010. This paper presents results obtained in support of this long range planning effort. These efforts identified optimum engine design requirements (e.g. size, cycle, duty cycle, and maintenance goals), high payoff advanced technologies and engine development-/qualification plans for 15 specific fighter, bomber, transport and V/STOL weapon systems under investigation. The elements of the long range plan were selected to minimize the life cycle cost of future weapon systems while at the same time providing the engine performance necessary to meet advanced weapon system combat requirements. (Author)

A82-35024 # A methodology for planning a cost effective engine development. W. S. Willis (General Electric Co., Evendale, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1140.* 7 p.

The Advanced Tactical Attack Manned System (ATAMS) was chosen as a subject for an advanced technology engine study, whose objective was the development of a life cycle cost methodology for the exploration of alternative propulsion system design and development approaches. Development schedules were evaluated with respect to their impact on product reliability, durability and life cycle cost, for the case of a mixed flow augmented turbofan with 17,150-lb thrust rating, after consideration of this engine's estimated life cycle cost breakdown, failure rate models, operating and support cost breakdown, and relative development cost dependence on quality of testing. A long range propulsion development plan is suggested in light of study results. O.C.

A82-35025 # Propulsion system requirements for advanced fighter aircraft. J. H. Kamman and D. C. Perryman (McDonnell Aircraft Co., St. Louis, MO). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1143.* 9 p.

The mission requirements stipulated for the next generation of Air Force and Navy fighter aircraft suggest the design characteristics and performance capabilities needed in a new engine. Engine cycle optimizations have been performed with reference to both system life cycle cost and takeoff gross weight, in view of primary and alternate missions. Parametric sensitivity results indicate the relative impact of both the primary engine cycle variables and the various mission segments envisaged on aircraft takeoff gross weight. The fighter aircraft considered are an Air Force air superiority configuration in the 40,000-lb weight class, with a 300-nautical mile mission radius, and a 50,000-lb weight class Navy combat air patrol mission configuration with a 200-nautical mile combat radius. Attention is given to the penalties of using derivatives of existing engines, as well as an engine development timetable spanning the period from mid-1982 to 1993. D.C.

A82-35041 * # Evaluation of fuel injection configurations to control carbon and soot formation in small GT combustors. T. J. Rosfjord (United Technologies Research Center, East Hartford, CT) and D. Briehl (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1175.* 12 p. 6 refs.

An experimental program to investigate hardware configurations which attempt to minimize carbon formation and soot production without sacrificing performance in small gas turbine combustors has been conducted at the United Technologies Research Center. Four fuel injectors, embodying either airblast atomization, pressure atomization, or fuel vaporization techniques, were combined with nozzle air swirlers and injector sheaths, and evaluated at test conditions which included and extended beyond standard small gas turbine combustor operation. Extensive testing was accomplished with configurations embodying either a spill return or a T-vaporizer injector. Minimal carbon deposits were observed on the spill return nozzle for tests using either Jet A or ERBS test fuel. A more extensive film of soft carbon was observed on the vaporizer after operation at standard engine conditions, with large carbonaceous growths forming on the device during off-design operation at low combustor inlet temperature. Test results indicated that smoke emission levels depended on the combustor fluid mechanics (especially the mixing rates near the injector), the atomization quality of the injector and the fuel hydrogen content. (Author)

A82-35044 # Small turbine engine augmentor design methodology. T. E. Kuhn, H. C. Mongia, T. W. Bruce (Garrett Turbine Engine Co., Phoenix, AZ), and E. Buchanan (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1179.* 8 p. 14 refs.

This paper describes a design technique based on the use of semianalytical methods, along with a multidimensional aerothermal analysis that has been developed for application to small thrust-class engines. Partial validation of the technique is presented, utilizing existing data on spray injection and flow characteristics around typical flameholders. This improved technique has been used to design an augmentor for a small gas turbine engine in a thrust class of less than 1000 pounds. Typical predictions of internal profiles of fuel/air ratio, temperature, velocity, and combustion efficiency are presented for the final configuration selected for the afterburner. (Author)

A82-35045 # The F404 development program - A new approach. G. C. Rapp (General Electric Co., Lynn, MA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1180.* 14 p.

The experience gained during more than 10 years of F404 engine development is summarized. To achieve maximum results, engine objectives must be clearly defined to permit major design decisions and trade-offs during the initial design

A82-35454 # Investigation of the transonic calibration characteristics of turbine static pressure probes. R. W. Langford, K. R. Keeley, and N. B. Wood (Central Electricity Generating Board, Central Electricity Research Laboratories, Leatherhead, Surrey, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-280.* 9 p. 12 refs. Members, $2.00; nonmembers, $4.00.

Measurement of static pressure in transonic turbines is made difficult because of the need to use probes with substantial support stems in the measurement plane, enabling them to traverse in the confined axial spaces between blade rows. Problems arise because of shock interactions with the probes and the close proximity of shock-reflecting surfaces. Tests show that the calibration can depend on the proportion of probe support immersed in the transonic flow. The wind tunnel gives only partial representation of the turbine transonic flow field, but by using turbine measured and computed static pressures the most representative calibration is selected. (Author)

A82-35455 # Solution to a bistable vibration problem using a plain, uncentralized squeeze film damper bearing. J. A. Palladino and T. W. Gray (General Electric Co., Aircraft Engine Business Group, Lynn, MA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-281.* 9 p. 5 refs. Members, $2.00; nonmembers, $4.00.

A study was carried out to investigate vibration related problems, namely cabin noise and high engine vibration levels, encountered during service introduction of an upgraded turbojet engine having a three-bearing support system with an overhung turbine. The problem was found to be due to an interaction between a rotor mode and a stator mode through bearing clearance, and it was proposed to use a plain, uncentralized, squeeze film damper to lower the turbine rotor critical speed and to eliminate the interaction between the rotor and stator modes. It is shown that with this design, the turbine critical speed is reduced to 25-30% of the rate speed, corresponding to a 50% reduction in the critical speed, and eliminates the bistable vibration. The effects of the exhaust system weight on the engine vibration and cabin noise are also discussed. V.L.

A82-35456 * # Structural dynamics of shroudless, hollow, fan blades with composite in-lays. R. A. Aiello, M. S. Hirschbein, and C. C. Chamis (NASA, Lewis Research Center, Cleveland, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-284.* 7 p. Members, $2.00; nonmembers, $4.00. (Previously announced in STAR as N82-22266)

A82-35457 # The effect of journal misalignment on the oil-film forces generated in a squeeze-film damper. R. A. Cookson (Cranfield Institute of Technology, Cranfield, Beds., England), X. H. Feng (Chinese Aeronautical Establishment, Aero-Gas Turbine Research Institute, Beijing, People's Republic of China), and S. S. Kossa (Military Technical College, Cairo, Egypt). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-285.* 5 p. 8 refs. Members, $2.00; nonmembers, $4.00.

The effect of journal misalignment in a two-land, squeeze-film damper on the oil-film pressure distribution and the resulting oil-film forces is investigated using a finite-difference technique implemented in a FORTRAN 1V computer program. It is found that the effect of misalignment can lead to a significant increase in the transmission of unbalance force through the oil film. This effect becomes more pronounced in the case of large ratio of land-length to radial clearance, large level of unbalance, or large bearing orbit. Although at this stage there is no clear indication of the range of operating conditions wherein allowance for misalignment should be made, a threshold of 0.0005 radians has been adopted in a current theoretical study into the effectiveness of uncentralized squeeze-film dampers. V.L.

A82-35462 * # Engine dynamic analysis with general nonlinear finite element codes. II - Bearing element implementation, overall numerical characteristics and benchmarking. J. Padovan, M. Adams, P. Lam (Akron, University, Akron, OH), D. Fertis, and I. Zeid (Northeastern University, Boston, MA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-292.* 9 p. 12 refs. Members, $2.00; nonmembers, $4.00. Grant No. NsG-3283.

Second-year efforts within a three-year study to develop and extend finite element (FE) methodology to efficiently handle the transient/steady state response of rotor-bearing-stator structure associated with gas turbine engines are outlined. The two main areas aim at (1) implanting the squeeze film damper element into a general purpose FE code for testing and evaluation; and (2) determining the numerical characteristics of the FE-generated rotor-bearing-stator simulation scheme. The governing FE field equations are set out and the solution methodology is presented. The choice of ADINA as the general-purpose FE code is explained, and the numerical operational characteristics of the direct integration approach of FE-generated rotor-bearing-stator simulations is determined, including benchmarking, comparison of explicit vs. implicit methodologies of direct integration, and demonstration problems. C.D.

A82-35463 # Ceramic turbine housings. A. F. McLean (Ford Motor Co., Dearborn, MI). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-293.* 10 p. 12 refs. Members, $2.00; nonmembers, $4.00. Research supported by the U.S. Department of Energy and DARPA.

A development program aimed at the application of ceramics to automotive gas turbine engine inner housings is described. After a review of the design concepts considered, and the comparison of candidate ceramic designs with conventional sheet metal or cast iron structures for internal hot gas transition ducts, consideration of the properties of reaction bonded silicon nitride, reaction bonded silicon carbide, and lithium aluminum silicate (LAS) led to the selection of LAS because of its low bulk thermal expansion characteristics. Forming processes such as slip casting and glass forming are considered, along with thermal and mechanical problems that inhere in such large ceramic components. The performance potential of ceramic turbine housings is established in light of the engine and rig tests evaluated. O.C.

A82-35465 # A procedure for evaluating fuel composition effects on combustor life. H. L. Foltz and M. J. Kenworthy (General Electric Co., Advanced Engineering and Technology Programs Dept., Cincinnati, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-296.* 6 p. 6 refs. Members, $2.00; nonmembers, $4.00. Contract No. N00140-80-C-2269.

A generalized method is presented for estimating the effects of fuel composition on liner life. This method avoids the detailed temperature and stress distribution calculations required when using conventional cyclic material property charts. The simplified approach became possible when it was found that cyclic life ratios due to fuel change were very similar when correlated with a convenient temperature parameter that had already been used in the past to correlate fuel composition with metal temperature change. This life ratio was found to be relatively independent of: (1) the peak temperature existing with the base fuel; (2) the coolant temperature; and (3) the actual detailed stress calculation. A trend of increased life ratio effect at longer cyclic lives for crack initiation was found. This trend can be incorporated into life ratio estimates from the prepared curves by using the actual observed service life without the need for a calculated absolute life. (Author)

A82-35469 # Heat transfer optimised turbine rotor blades - An experimental study using transient techniques. J. H. Nicholson, A. E. Forest (Rolls-Royce, Ltd., Derby, England), M. L. G. Oldfield, and D. L. Schultz (Oxford University, Oxford, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-304.* 11 p. 10 refs. Members, $2.00; nonmembers, $4.00.

Conventionally, high pressure turbine blading is optimized for aerodynamic performance without any film cooling applied to the surfaces of the blades. It is considered that modern boundary layer prediction techniques are now sufficiently accurate to allow the heat transfer to be considered at the profile design stage. Two turbine rotor profiles were designed, each with a heat-transfer-optimised pressure surface, and a detailed experimental study using transient techniques in the Oxford cascade tunnel was made. The results show that significant reductions in pressure surface heat transfer can be achieved by boundary layer optimization without compromising the aerodynamic efficiency of the blades. A description of the profiles is given, together with transfer rate measurements, pressure distribution, and aerodynamic loss measurements (a technique developed to measure aerodynamic loss in a transient cascade is described) and flow visualisation photographs. (Author)

A82-35470 # The effect of temperature ratios on the film cooling process. P. J. Loftus and T. V. Jones (Oxford University, Oxford, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-305.* 6 p. 11 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Rolls-Royce, Ltd. and Ministry of Defence (Procurement Executive) of England.

Film cooling experiments have been conducted at conditions which realistically simulate gas turbine environment. Heat transfer has been measured using a short duration wind tunnel. Mainstream injection and wall temperatures have been varied independently in order to conduct a systematic investigation of the injection process. A model of the film cooling process based on the principle of superposition is used to interpret the experimental results. The effect of gas to wall temperature ratio on heat transfer to an uncooled plate has also been investigated. (Author)

A82-35479 # Technology advancements for energy efficient aircraft engines. R. W. Bucy (General Electric Co., Cincinnati, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1051.* 9 p. 9 refs.

The rapid increase in fuel costs since 1973 has been a major influence on the economics of the commercial aircraft fleet. The development of more fuel efficient aircraft engines has, therefore, become an important priority for aircraft engine manufacturers and NASA. Major goals of a program designed to achieve better fuel efficiency include, relative to the CF6-50C reference engine, 12% reduction in installed Specific Fuel Consumption (SFC), 5% reduction in Direct Operating Costs (DOC), and 50% reduction in the SFC deterioration rate in commercial service. A description is presented of the progress made, in connection with the considered program, over the past four and one-half years. Attention is given to component and engine development tests, the fan component test, high pressure compressor component tests, combustor component tests, high and low pressure turbine component tests, and overall systems integration. G.R.

A82-35555 # Commercial transports - Aerodynamic design for cruise performance efficiency. F. T. Lynch (Douglas Aircraft Co., Long Beach, CA). In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 81-147. 35 refs.

After a preliminary discussion of basic differences in the transonic flow problems addressed by designers of military aircraft and commercial transports in their efforts to increase cruise performance efficiency, the cruise drag efficiency of existing commercial transport aircraft are examined to determine areas for intensive future development. It is shown that, in order to permit the development of computational design procedures for the accurate calculation of three-dimensional swept wing drag and buffet-onset characteristics, collaboration is needed between developers of transonic potential flow techniques and viscous and inviscid-viscous interaction techniques. In addition, exploitation of the high Reynolds number capability of the National Transonic Facility requires additional development of instrumentation and of testing techniques aimed at flow visualization. O.C.

A82-35556 # Practical aerodynamic problems - Military aircraft. R. G. Bradley (General Dynamics Corp., Fort Worth, TX). In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 149-187. 28 refs.

The compromises required by tactical military aircraft design, because of the multiple design point requirements associated with missions which require good low-speed efficiency, and both transonic and supersonic cruise and maneuver characteristics, are discussed for the case of such existing aircraft as the F-16 and similar experimental aircraft. It is shown that the wing design of tactical aircraft is heavily influenced by supersonic requirements for minimum thickness and low camber. It is suggested that the development of methods for the analytical design of wings relying on simple leading and trailing edge flaps in transonic maneuvers be emphasized. It is noted that aeroelastic tailoring is a valuable tool in providing favorable camber and twist for thin-winged fighter configurations, and that analytical methods for the calculation of operational store loads and separation trajectories are not satisfactory in the transonic regime. O.C.

A82-35557 # Experimental testing at transonic speeds. J. A. Blackwell, Jr. (Lockheed-Georgia Co., Marietta, GA). In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 189-238. 30 refs.

The process of experimental design for wind tunnel tests of aircraft configurations and components at transonic speeds are explored, along with suggestions for the solutions of problems encountered in experimental testing. Accounting for uncontrollable variables such as the wall effect, through computational allowances, model sizing, and streamlined tunnel walls is described. The tailoring of models for trials is examined for cases of basic research, concept development, code verification, configuration development, and production aircraft models. Minimization of model support systems' flow interference is discussed for wall mounts and sting mounts, as well as for power plant configurations. Finally, methods of accurately producing scaled-down Reynolds number flows which will retain their applicability to the real world are detailed. M.S.K.

A82-35560 # Transonic design using computational aerodynamics. M. E. Lores and B. L. Hinson (Lockheed-Georgia Co., Marietta, GA). In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 377-402. 16 refs.

Design methods for improving aircraft performance in transonic regimes are reviewed in terms of inverse solution and numerical optimization methods. Inverse schemes involve computation of the surface velocity potential from surface pressures to obtain a Dirichlet boundary condition. A geometry is then developed by solving a potential flow equation and integration of a tangential flow equation. Weaknesses of the method are discussed, noting the inverse methods are useful for initial wing design. Numerical optimization requires choice of a starting geometry, defining the design objective, and then specifying the constraints. The design proceeds in a series of searches in which variables are perturbed to test the effects on the design objectives and constraints. An example of the numerical optimization of a C-141B to include a 0.03 increase in the Mach cruise speed is presented. M.S.K.

A82-35561 # Application of computational methods to transonic wing-design. I. C. Bhateley and R. A. Cox (General Dynamics Corp., Fort Worth, TX). In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 405-430. 23 refs.

Available transonic computational methods for wing design are examined and examples are provided. The governing equations, differencing techniques, geometry modeled, the necessity for viscous corrections, and the Mach number range of presently used computer codes are detailed. The schemes considered include the Bailey-Ballhaus, Pandora-Boppe, Jameson FLO-22 Caughey, the Jameson FLO-27 Caughey, and the advanced Jameson FLO-28/30 codes. Design techniques which employ one or several codes for the simulation of aircraft components or combinations of components in a transonic flow regime are outlined. Specific examples are made of a trainer wing refinement, and an advanced fighter flap design. The codes are concluded to be deficient in treating complex configurations such as fuselages, and also to require large amounts of computational time. M.S.K.

A82-35562 # A-7 transonic wing designs. H. P. Haney (Lockheed-Georgia Co. Marietta, GA). In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 431-450. 10 refs.

The problems encountered in applying available computer codes to the computational design of new wings for the A-7 aircraft are reported. The Navy and NASA performed the study in the period 1976-1980 to correlate the FLO-22 code wing analysis with wind tunnel data, to optimize transonic airfoils, numerically optimize wing design, design two different wings for different criteria, wind tunnel test the pressure models of the new wings, and compare experimental results with the model predictions. Simulation of the existing A-7 wing by means of the FLO-22 code showed agreement satisfactory enough for the study to proceed. Design constraints on the new airfoil included a 0.4 lift coefficient and 0.78 Mach number. It was found that only a few of 25 design variables could be used in each wing section, thereby requiring rerunning the code for each variable when gradients were needed. Correlations drawn from wind tunnel tests were concluded unsatisfactory for optimization purposes. M.S.K.

A82-35563 # Transonic computational experience for advanced tactical aircraft. E. Bonner and P. B. Gingrich (Rockwell International Corp., Aircraft Group, Los Angeles, CA). In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 451-465. 10 refs.

Three-dimensional transonic numerical analysis performed for the HiMAT and FSW wing definition is described, along with comparisons with experimental results. HiMAT maneuver wings were analyzed with the Bailey-Ballhaus classical small disturbance theory, which was found to predict the entire upper surface flow after modifications of the Karman-Guderly transonic small disturbance equation. Multiple surface interactions are noted to be necessarily studied instead of in isolated components at subsonic and supersonic speeds. An approximate procedure was found for changing the wing twist to account for the canard downwash, and a full potential assessment is presented, along with comparisons for a near maneuver condition of Mach 0.9 at an angle of attack of 10 deg. Forward swept wing analysis is discussed, noting that test results were not well predicted by small disturbance or full potential analysis. M.S.K.

A82-35564 # Extension of FLO codes to transonic flow prediction for fighter configurations. A. Verhoff and P. J. O'Neil (McDonnell Aircraft Co., St. Louis, MO). In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 467-487. 11 refs. Research supported by the McDonnell Douglas Independent Research and Development Program.

The applications of FLO and equivalent simple body (ESB) computer codes to simulating transonic behavior of various fighter aircraft are described. The ESB program is employed to model complex geometries such as the wing/fuselage combination using a panel method. The models are valid at small angles of attack and linear and Mach independent, thereby suitable for the transonic regime. When employed with the FLO codes, the ESB technique allows determination of the perturbation velocity distributions of a complex fuselage. Correlations are then available for FLO code results at subcritical Mach numbers, and the FLO program can be used for transonic regimes. The results of applications to the F-15 geometry are presented, and further use for modeling the F/A-18, the rectangular wings by making chordwise and compressibility corrections is extended to cover wings of any arbitrary planform in subsonic and supersonic flows. The numerical accuracy of the present work is better than that of the Lomax-Sluder results. Comparison of the results of this work with those of the vortex-lattice method and Kernel function method for a family of Gothic and arrowhead wings shows good agreement. A universal curve is proposed for the evaluation of the lift coefficient of a low aspect ratio wing of an arbitrary planform in subsonic flow. The location of the center of pressure can also be estimated. (Author)

A82-37945 # Static and aeroelastic optimization of aircraft (Optimisation statique et aéroélastique des avions). J. M. Thomas (Société Nationale Industrielle Aérospatiale, Toulouse, France). *Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, International Symposium on Aeroelasticity, Nuremberg, West Germany, Oct. 5-7, 1981, Paper.* 9 p. In French.

Techniques for the finite element modeling of the static and aeroelastic stresses on an aircraft are described. The methods are intended to serve to define sustainable loads in aircraft structures which are built with minimized weight. Attention is focussed on the components of the ASELF program, which comprises analyses of linear and nonlinear statics, crack propagation, thermal effects and static and dynamic aeroelastic characteristics. Partial derivatives are obtained for the displacements, elastic, principal, and equivalent stresses, the rupture criteria, panel buckling, and internal interactions between groups of elements. Constraints are placed on the optimization through formulation of the displacements, a rigidity matrix, and a determination of the external stresses. An optimization example is provided for a composite sheets bordering openings in the aircraft or in the empennage using 1952 degrees of freedom with 3684 elements. M.S.K.

A82-37946 # Survey of active and passive means to reduce rotorcraft vibrations. G. Reichert and H. Strehlow (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, International Symposium on Aeroelasticity, Nuremberg, West Germany, Oct. 5-7, 1981, Paper.* 50 p. 56 refs.

Methods employed and proposed for reducing rotorcraft vibrations are reviewed, with attention given to development and test programs. Active vibration isolators such as force generators, springs, and dampers are noted to possess advantages over passive systems, due to the ability to supply variable power, to react to many variables in a local force, and modifiability to meet performance specifications. Sources of rotorcraft vibrations are identified, along with options for controlling the vibrations, structural tuning, dynamic absorbers in the rotating and nonrotating system, rotor isolation, and multicyclic pitch or twist control. The underlying principle is compensation, enacted by producing harmonic forces to offset disturbances. The use of passive antiresonant force isolators as connecting members between the rotor-transmission unit and the fuselage is discussed as an effective combination of spring passive force generator. M.S.K.

A82-37947 F-16 active flutter suppression program. R. P. Peloubet, Jr., R. L. Haller, and R. M. Bolding (General Dynamics Corp., Fort Worth, TX). *Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, International Symposium on Aeroelasticity, Nuremberg, West Germany, Oct. 5-7, 1981, Paper.* 14 p. 12 refs. Contracts No. F33615-77-C-3081; No. F33615-80-C-3210.

The F-16 military aircraft is required to carry a very large number of external store configurations, and new store configurations are continuously being added to its inventory. Therefore, the probability increases that eventually store configurations might be added which would cause wing/store flutter that could not be easily stabilized by passive means. The F-16 flutter suppression program has the objective to develop the technology for a flutter suppression system (FSS) which could be employed in case such stabilization difficulties with the F-16 should occur. Attention is given to an overview of an F-16 FSS feasibility study, a description of an analog study of a technique for measuring the FSS open-loop frequency response functions (FRF) during wind tunnel tests, a description of wind tunnel tests of the F-16 flutter suppression model which were conducted from 27 January through 8 February 1979, and planned wind tunnel tests to be conducted during the fall of 1981. G.R.

A82-37969 USAF ACES II progress report. R. C. Delgado (USAF, Air Force Inspection and Safety Center, Norton AFB, CA). *SAFE Journal*, vol. 12, Summer 1982, p. 10-12.

A review of the operational experience for the Advanced Concept Ejection Seat (ACES II), in operational use in USAF aircraft since 1978, is presented. The ejection survival rate using the ACES II (83%) exceeds the rate for other USAF escape systems (74%). Moreover, none of the fatalities can be attributed to the ACES II seat. In addition, the major injury rate for the ACES II was only 4%, compared to others' 17%. A series of tables providing injury definitions as well as statistical data (ejection speed, ejection altitude, etc.) are presented. N.B.

A82-37970 Lear Fan 2100 egress system. D. W. Newton (Lear Fan Corp., Reno, NV). *SAFE Journal*, vol. 12, Summer 1982, p. 18-22.

This paper describes the crew emergency egress system developed and installed on the Lear Fan 2100 flight test prototype. The unique configuration of the airplane, which includes a large Y tail and aft mounted propeller, required development of a method of escape which would assure positive clearance of crewmembers from the airframe during a bailout. The total system which was developed includes an explosive door removal system, a crewmember rocket extraction system, and a seat mover system to transport the crewmember to the escape opening. The philosophy which led the company to develop this particular system, together with its advantages and limitations, is discussed. The system is unique in general aviation aircraft, and represents a considerable advancement in emergency escape capability for such aircraft. Extensive testing of the system, including explosive cutting tests of the graphite/epoxy airframe structural members, a stationary test of the extraction system, and a 350 knot jet sled test, was conducted and is described. A82-37972 # Strategic materials - Technological trends. A. Hurlich. *Mechanical Engineering*, vol. 104, July 1982, p. 44-53. 5 refs.

The US is becoming increasingly dependent upon other countries for sources of strategic materials - raw materials such as cobalt, aluminum, manganese and chromium needed to supply military, industrial and civilian needs during a national emergency and found domestically in insufficient quantities. Various ways of reducing the US vulnerability in these strategic materials are reviewed, emphasizing technological methods to reduce consumption. The use of recycling, scrap recovery and conversation methods is expanding, but these efforts are insufficient. Another approach is to develop materials management programs, such as devising lists of alternative materials that may be used in case the normally used materials become unavailable, and strategic planning to limit the use of critical materials that may pose serious problems if their supply is interrupted. New materials and technologies are being developed and tested to reduce as much as possible the use of strategic materials - such as reducing the amount of chromium in certain stainless steels from 12-18% to 2-6%. The use of near net shape technology also can save large amounts of materials by eliminating trimming waste. Investigation and development of possible substitutes for strategic materials are now being conducted by government agencies and private industry. Finally, stockpiling is mentioned as a way to ensure adequate supplies when no substitutes are available. N.B.

A82-38025 The recognition of air worthiness of aircraft - Comments to a remarkable judicial decision (Zur Anerkennung der Lufttüchtigkeit von Flugzeugen - Bemerkungen zu einem bemerkenswerten Urteil). A. Rudolf. *Zeitschrift für Luft- und Weltraumrecht*, vol. 31, June 1982, p. 124-128. 15 refs. In German.

A judicial decision made by the U.S. Court of Appeals is discussed, taking into consideration the question whether a German judge might have arrived at the same decision as the American judge, and the legal consequences of such a decision. The considered decision is related to a complaint filed by foreign airlines with respect to an act of the Federal Aviation Agency (FAA). After an aircraft accident involving the loss of a U.S. DC-10 airliner on May 25, 1979, at Chicago, the FAA had prohibited for U.S. airspace the operation of all DC-10 aircraft, including those registered in foreign countries. The plaintiffs maintain that this act would constitute a violation of Article 33 of the Chicago Convention, which, in its turn, would violate Paragraph 1102 FAAct. The Court agreed with the plaintiffs. G.R.

A82-38077 * Development and validation of preliminary analytical models for aircraft interior noise prediction. L. D. Pope, D. C. Rennison (Bolt Beranek and Newman, Inc., Canoga Park, CA), C. M. Willis, and W. H. Mayes (NASA, Langley Research Center, Hampton, VA). *Journal of Sound and Vibration*, vol. 82, June 22, 1982, p. 541-575. 19 refs. Contract No. NAS1-15782.

Predictions are made of the transmission of sound into an unpressurized and unstiffened cylinder under random and harmonic excitations, in order to validate the preliminary version of an airplane interior noise prediction model which is based on an analysis of the power flow type. The predictions are compared to experimental results, and statistically significant differences between predictions and measurements are found to be primarily due to input data deficiencies. Because the model requires only the value of a simple integral for determining interior spatial coupling, and resonance frequencies to determine frequency coupling, the known dynamics of the fuselage can be utilized without difficulty. O.C.

The programmable pilot oriented display (P-POD), a multiprocessor based flight information processing and display unit, is discussed. Communication protocols between the three Z-80 processors inside P-POD are reviewed. The interface between the video processor, P2, and the main processor, P1, was tested. Hardware and software were revised. Data flow between P1 and P2 is illustrated. While running diagnostic routines to exercise the P1/P2 interface at maximum speed an intermittent failure was observed. A check of possible noise sources or race conditions in the hardware did not reveal the source of this failure. Possible software timing problems were also fully investigated. To eliminate the effects of this type of failure a performance monitor routine was used to detect these occasional failures and correct them. The data transmission cycle between P1/P2 is either allowed to continue normal operation or is re-initialized and restarted when an error is detected. N.W.

The concept of using microwave energy to provide aircraft ice protection, specifically an anti-icing system, and the feasibility of such a system are discussed. In a microwave anti-icing system impinging supercooled water droplets are heated to above freezing by the resonant absorption of microwave energy located upstream of the aircraft. This process is inherently more efficient than existing anti-icing devices due to the saving of the latent heat of fusion (a substantial 334 joules/gm (80 cal/gm)) and the fact that only the droplets are heated, thereby reducing convective losses to the air. KOVATS INDICES AS A TOOL IN CHARACTERIZING HYDROCARBON FUELS IN TEMPERATURE PROGRAMMED GLASS CAPILLARY GAS CHROMATOGRAPHY. PART 1: QUALITATIVE IDENTIFICATION Final Report, Dec. 1979 - Sep. 1980
Paul C Hayes, Jr and Edward W Pitzer Nov. 1981 85 p refs
(AF Proj. 3048)
(AD-A111389; AFWAL-TR-81-2102) Avail: NTIS HC A05/MF A01 CSCL 21/4

Kovats Indices are used as a tool to identify the major components of several aircraft jet fuels of the JP-4 type. Glass capillary gas chromatography in the temperature programmed mode was the technique of choice The first phase of the effort involved optimization of the capillary system for the maximum resolution between a selected pair of normal hydrocarbons in an acceptable analysis time Peak resolution was investigated as a function of carrier capillary pressure, temperature programming rate, and initial column temperature. Eleven qualitatively known and quantitatively accurate calibration solutions were prepared to include over 200 different hydrocarbons. Kovats Indices were generated for these solutions in a statistically reliable fashion on two capillary columns of different polarities. Thus, each hydrocarbon standard had its own unique set of two Kovats Indices Several petroleum, as well as shale derived, JP-4 samples were subsequently chromatographed on the same two capillary columns Peaks were given tentative identification by matching of Kovats Indices Author (GRA)

HOT ISOSTATICALLY PRESSED MANUFACTURE OF HIGH STRENGTH MERL 76 DISK AND SEAL SHAPES Final Report
R D Eng and D J Evans May 1982 139 p refs
(Contract NAS3-20072)
(NASA-CR-165549; NAS 1 26 165549; PWA/5574-123) Avail: NTIS HC A07/MF A01 CSCL 11F

The feasibility of using MERL 76, an advanced high strength direct hot isostatic pressed powder metallurgy superalloy, as a full scale component in a high technology, long life, commercial turbine engine were demonstrated. The component was a JT9D first stage turbine disk The JT9D disk rim temperature capability was increased by at least 22 C and the weight of JT9D high pressure turbine rotating components was reduced by at least 35 pounds by replacement of forged Superwaspaloy components with hot isostatic pressed (HIP) MERL 76 components. The process control plan and acceptance criteria for manufacture of MERL 76 HIP consolidated components were generated. Disk components were manufactured for spin/burst rig test, experimental engine tests, and design data generation, which established lower design properties including tensile, stress-rupture, 0.2% creep and notched (Kt = 2.5) low cycle fatigue properties, Sonntag, fatigue crack propagation, and low cycle fatigue crack threshold data Direct HIP MERL 76, when compared to conventionally forged Superwaspaloy, is demonstrated to be superior in mechanical properties, increased rim temperature capability, reduced component weight, and reduced material cost by at least 30% based on 1980 costs. Since the reliability of wear metal determinations depends on the integrity of the primary standards used to calibrate the instruments, standards were synthesized and evaluated for use in the Oil Analysis Program (OAP) The standards currently used by the Air Force, in addition to Cannon, metal caprates, metal beta-diketonates, and NBS standards were evaluated for their long term stability. Two state-of-the-art plasma emission instruments were evaluated for their potential applications to the AF OAP The goal of this effort was to improve the particle detection capability of oil analysis instruments. The sample introduction systems used by these instruments could not efficiently transport particles to the plasma sources. However, the dc plasma instrument could analyze particles better than currently used instruments Research was also conducted to identify and characterize wear debris found in typical used turbine engine lubricating oils. Methods were developed to determine the concentration of organometallic, metallic and metal oxide species in oils for Mg, Cu and Fe. An investigation was conducted to determine and recommend optimized atomic absorption procedures for analysis of wear metals in aircraft lubricating oils. Optimization procedures and recommended AA methods are included. A method was developed to determine the 'actual' concentration of wear metals in authentic used aircraft engine oils. It is quantitative for Al, Cr, Cu, Fe, Mg, Mo, Ni, Pb, Sn and Ti metallic particles. GRA

(Contract NAS1-15843)
(NASA-CR-165839; NAS 1.26:165839) Avail: NTIS HC A08/MF A01 CSCL 11A

The technology required to produce graphite-polyimide structural components with operational capability at 598 K (600 F) is considered. A series of polyimide adhesives was screened for mechanical and physical properties and processibility in fabricating large midplane bonded panels and honeycomb sandwich panels in an effort to fabricate a structural test component of the space shuttle aft body flap. From 41 formulations, LaRC-13, FM34B-18, and a modified LaRC-13 adhesive were selected for further evaluation. The LaRC-13 adhesive was rated as the best of the three adhesives in terms of availability, cost, processibility, properties, and ability to produce void fee large area (12' x 12') midplane bonds. Surface treatments and primers for the adhesives were evaluated and processes were developed for the fabrication of honeycomb sandwich panels of very good quality which was evidenced by rupture in the honeycomb core rather than in the facesheet bands on flatwise tensile strength testing. The fabrication of the adhesively bonded honeycomb sandwich cover panels, ribs, and leading edge covers of Celion graphite/LARC-160 polyimide laminates is described. A.R.H.

EXPERIMENTS ON FUEL HEATING FOR COMMERCIAL AIRCRAFT
R. Friedman and F. J. Stockemer (Lockheed-California Co., Burbank, Calif.) 1982 15 p refs Presented at 18th Joint Propulsion Conf., Cleveland, 21-23 Jun. 1982; Sponsored by AIAA, SAE and ASME
(NASA-TM-82878; E-1254; NAS 1.15:82878) Avail: NTIS HC A02/MF A01 CSCL 21D

An experimental jet fuel with a -33 C freezing point was chilled in a wing tank simulator with superimposed fuel heating to improve low temperature flowability. Heating consisted of circulating a portion of the fuel to an external heat exchanger and returning the heated fuel to the tank. Flowability was determined by the mass percent of unpumpable fuel (holdup) left in the simulator upon withdrawal of fuel at the conclusion of testing. The study demonstrated that fuel heating is feasible and improves flowability as compared to that of baseline, unheated tests. Delayed heating with initiation when the fuel reaches a prescribed low temperature limit, showed promise of being more efficient than continuous heating. Regardless of the mode or rate of heating, complete flowability (zero holdup) could not be restored by fuel heating. The severe, extreme-day environment imposed by the test caused a very small amount of subfreezing fuel to be retained near the tank surfaces even at high rates of heating. Correlations of flowability established for unheated fuel tests also could be applied to the heated test results if based on boundary-layer temperature or a solid index (subfreezing point) characteristic of the fuel. MOBILITY FUELS FOR THE NAVY
Thomas ONeill Jan. 1982 21 p refs
(Contract N00014-76-C-0001)
(AD-A112511; CNA-PP-336) Avail: NTIS HC A02/MF A01 CSCL 21/4

As fuel declines, both specifications and engine designs will have to be modified to accommodate this change. In addition, specifications have to reflect the fact that fuel chemistry itself is undergoing change, so that new problems have begun to arise. Recently, batches of DFM and JP-5 that passed inspection have been associated with fuel filter clogging and excessive smoking. The mechanisms of these effects are not clearly understood. As synfuels are introduced, the variety of chemicals in fuels will be greatly expanded, and this will cause a new range of problems. Besides modifying the specifications of current fuels to address the issues of price and availability, other ways might come from changing the types of fuel burned. The Navy could attempt to switch to fuels in civilian use. Number 2 diesel oil is similar to the ship fuel DFM, while Jet A-1 is not unlike the aircraft fuel JP-5. Another approach could involve the use of just one type of fuel for both ships and airplanes. This would reduce storage and handling costs, perhaps enough to offset the modest differential of 5 cents per gallon between JP-5 and DFM that existed in October 1981. GRA

DEVELOPMENT OF ARMY HIGH-ENERGY FUEL DIESEL/TURBINE-POWERED SURFACE EQUIPMENT, PHASE 2 Interim Report, Oct. 1979 - Sep. 1981
William W. Wimer and D. M. Yost Dec. 1981 134 p refs
(Contracts DAAK70-80-C-0001; DAAK70-82-C-0001; DA Proj. 1L7-62733-AH-20)
(AD-A111942; AFLRL-147) Avail: NTIS HC A07/MF A01 CSCL 21/4

The Army is interested in those fuels that have a high-energy content per unit volume and therefore result in increased payload capabilities and/or extended operational range of the vehicle. A series of screening processes are being used to identify those fuels and/or fuel components that could result in an increase of 10 percent in the range of the vehicle without an increase in the fuel tank size, i.e., fuels with a high-energy content percent volume. The chemical and physical properties of various candidate fuels and fuel components are described. The fuel components included both liquids and solids (at room temperature). The blending of the various components and the characterization of the resulting fuels are outlined. Solubility studies were done on some of the solid components to assist in obtaining the resulting fuel in the more desirable liquid state. Those solid components, such as anthracene, that were insoluble in the tests conducted but judged to have good high-energy potential, were studied as slurries. Catalyzed 'carbon black' was investigated. Settling studies with carbonaceous fuels included the effect of temperature upon the stability, the stability of FRF-carbon slurries, and the refinement of the previously reported 'Freezing Tube Technique' for measuring stability. Impact dispersion tests were conducted to study the fire-safety characteristics of energy-augmented fuels. The screening of candidate fuels with the Petter engine is described in detail. Other engine studies with the CLR engine are also included. Author (GRA)

Airborne gamma-ray spectrometer and magnetometer survey. Umiat quadrangle, Alaska, volume 2
[DE82-000312] N82-24632
Airborne gamma-ray spectrometer and magnetometer survey. Barrow quadranagle, Alaska, volume 2
[DE82-000342] N82-25623

MINICOMPUTERS
Potentiality assessment of a parallel structure for the solution of partial differential equations
A82-33628

MIRRORS
Testing of the Kuiper Airborne Observatory 91-CM telescope
[NASA-CR-166341] N82-25040

MISSILE CONFIGURATIONS
An analytical procedure for computing smooth transitions between two specified cross sections with applications to blended wing body configuration
[NASA-TP-2012] N82-25193

MISSILE DESIGN
An analytical procedure for computing smooth transitions between two specified cross sections with applications to blended wing body configuration
[NASA-TP-2012] N82-25193

MISSION PLANNING
The National Airspace System plan
A82-33893

MOUNTING
Adapter for mounting microphone flush with the external surface of the skin of a pressurized aircraft
[NASA-CASE-FRC-11072-1] N82-24474

MOVING TARGET INDICATORS
Doppler processing, waveform design and performance measures for some pulsed Doppler and MTD-radars. II
A82-34671

MULTIPLE ACCESS
Outline of a multiple-access communication network based on adaptive arrays
A82-34607

MULTIPLEXING
Applications of a multiplexed GPS user set
A82-33050

MULTIPROCESSING (COMPUTERS)
Electronic Warfare Avionics Integration Support Facility support processor
[AD-A111641] N82-25249

MULTISPECTRAL BAND SCANNERS
A system design for a multispectral sensor using two-dimensional solid-state imaging arrays
A82-31991

N

NACELLES
Experimental determination of flow-interference effects of wing-mounted, two-dimensional, full-capture propulsion nacelles in close proximity to a vehicle body at a Mach number of 6
[NASA-TM-83287] N82-25217

NASA PROGRAMS
Aerospace engineers: We're tomorrow-minded people
[NASA-EP-188] N82-25017
Propulsion/ACEE
[NASA-FACTS-93/8-81] N82-25251
The first A in NASA
[GPO-89-476] N82-25271

NATIONAL AIRSPACE UTILIZATION SYSTEM
The National Airspace System plan
A82-33893

NAVIGATION
Improvement program for the C-141 Navigation Selector Panel
[AD-A111069] N82-25388
NAVIGATION AIDS
Round table discussion on the transfer of results from the project "Aids to navigation and control of air traffic"
[FUB-20-ATC-1981] N82-24192
NAVIGATION INSTRUMENTS
Applications of a multiplexed GPS user set
A82-33050
NAVY
X-wing and the Navy V/STOL initiative
A82-33915
NICKEL ALLOYS
A status review of NASA's COSAM (Conservation Of Strategic Aerospace Materials) program
[NASA-TM-82852] N82-24326
NIOBIUM
A status review of NASA's COSAM (Conservation Of Strategic Aerospace Materials) program
[NASA-TM-82852] N82-24326
NOISE (SOUND)
Generation of noise by turbulence
[ONERA-P-1981-3] N82-24946
NOISE GENERATORS
Generation of noise by turbulence
[ONERA-P-1981-3] N82-24946
NOISE REDUCTION
Airbus industry and noise in the community
[SNIAS-821-111-111] N82-24739
Aeroacoustic performance of an externally blown flap configuration with several flap noise suppression devices
[NASA-TP-1995] N82-24942
Development of an analytical technique for the optimization of jet engine and duct acoustic liners
[NASA-CR-168002] N82-25256
NONDESTRUCTIVE TESTS
Nondestructive detection of exfoliation corrosion around fastener holes in aluminum wing skins
A82-32725
Comparison between probability of detection, sensitivity, and accuracy of five nondestructive inspection methods --- high strength steel aircraft undercarriage retraction cylinders
[NLR-MP-81038-U] N82-24500
NONEQUILIBRIUM RADIATION
Radiation enhancement by nonequilibrium during flight through the Titan atmosphere
[AIAA PAPER 82-0878] A82-31883
NONLINEAR SYSTEMS
The determination of critical flutter conditions of nonlinear systems
[NAE-TM-STRUCT-906] N82-24210
Nonlinear structural and life analyses of a combustor liner
[NASA-TM-82846] N82-24501
NORTH DAKOTA
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 1
[DE82-004150] N82-24629
Airborne gamma-ray spectrometer and magnetometer survey. Jamestown quadrangle, North Dakota, volume 2
[DE82-004169] N82-24630
NOSE WHEELS
Electro-hydraulic nose wheel steering of the Dornier 228
A82-34373
OV-10A nose gear fork damage analysis
[AD-A111492] N82-25244
NOZZLE FLOW
Aerodynamic interactions with turbulent jet exhaust plumes
A82-33325
NOZZLE INSERTS
Failure analysis of silica phenolic nozzle liners
A82-34882
NUCLEAR PROPELLED AIRCRAFT
Very large aircraft with alternate fuels - LH2 most promising
[AIAA PAPER 82-0812] A82-31986
NUMERICAL ANALYSIS
A unified and generalized definition of static longitudinal stability in aircraft
A82-33135
Trends in structural analysis at ONERA
[ONERA, TP NO. 1982-2] A82-30491
NUMERICAL CONTROL
Automatic checking of measuring units in the Modane wind tunnels
[ONERA, TP NO. 1982-10] A82-30498
NUMERICAL FLOW VISUALIZATION
A system for the numerical simulation of sub- and transonic viscous attached flows around wing-body configurations
[AIAA PAPER 82-0935] A82-31922
Mathematical modeling of vortically separated flow past solid airfoil cascades
A82-32801

O

ON-LINE SYSTEMS
On-line experiments in acquiring and exploiting AIDS data for ATC purposes
N82-25175
Structures testing analysis real-time network (STARNET)
[AD-A111636] N82-25427
ONBOARD DATA PROCESSING
Gathering and analysing data on the British Airways Boeing 757 aircraft
N82-25186
ONBOARD EQUIPMENT
An aircraft sensor fault tolerant system
[NASA-CR-165876] N82-25236
OPERATING SYSTEMS (COMPUTERS)
An assessment of the real-time application capabilities of the SIFT computer system
[NASA-TM-84482] N82-25811
OPERATORS (PERSONNEL)
Predicting the application of vicarious liability to fixed base operators - Still guesswork after all these years
A82-32056
OPTICAL MEASUREMENT
Method for the measurement of elastic deformations of aircraft models in a wind tunnel
A82-34162
OPTICAL PROPERTIES
Techniques suitable for a portable wear metal analyzer
[AD-A111352] N82-25408
OPTICAL RADAR
Cloud top remote sensing by airborne lidar
A82-32840
Airborne lidar measurements of the Soufriere eruption of 17 April 1979
A82-33651
OPTICAL SCANNERS
An optical data link for airborne scanning system
A82-34737
OPTIMAL CONTROL
Automation of the synthesis of control in a stationary linear system --- for aircraft flight control
A82-34464
Prediction of aircraft handling qualities using analytical models of the human pilot
[NASA-TM-84233] N82-24288
Optimization of auto-pilot equations for rapid estimation of helicopter control settings
[AD-A110739] N82-25263
OPTIMIZATION
Combining analysis with optimization at Langley Research Center. An evolutionary process
[NASA-TM-84472] N82-24484
Opportunities for wind-tunnel/flight correlation with new Boeing airplanes
N82-25386
Panel Optimization with Integrated Software (POIS). Volume 1: PANDA: Interactive program for preliminary minimum weight design
[AD-A110363] N82-25484
Mathematical models for the synthesis and optimization of spiral bevel gear tooth surfaces --- for helicopter transmissions
[NASA-CR-3553] N82-25316

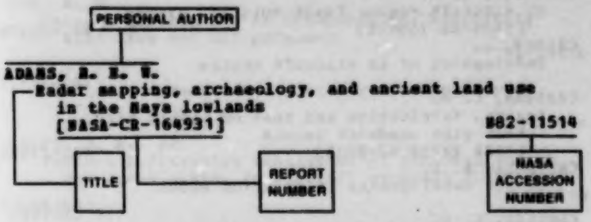
X

X RAY SPECTROSCOPY
  Techniques suitable for a portable wear metal analyzer
  [AD-A111352] N82-25488
X WING ROTORS
  X-wing and the Navy V/STOL initiative
  A82-33915
XV-15 AIRCRAFT
  XV-15 - Foretelling things to come
  A82-33914
  V/STOL tilt rotor research aircraft. Volume 1: General information, revision C
  [NASA-CR-166347] N82-24194
  V/STOL tilt rotor research aircraft. Volume 2: Ship 1 instrumentation
  [NASA-CR-166348] N82-24195
  V/STOL tilt rotor research aircraft. Volume 3: Ship 2 instrumentation
  [NASA-CR-166349] N82-24196
  V/STOL tilt rotor research aircraft. Volume 4: CPE technical data
  [NASA-CR-166350] N82-24197

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING / *A Continuing Bibliography (Suppl. 152)* **SEPTEMBER 1982**

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

A

AKIYAMA, H.
Hydrogen economy assessment for long-term energy systems in Japan
A82-32159

ALLEN, J. E.
Aerodynamics: The science of air in motion /2nd edition/
A82-33671

AMUNDSON, D.
Solid-state flight incident recorder
N82-25172

ANDERSEN, B. B.
Techniques suitable for a portable wear metal analyzer
[AD-A111352] N82-25488

ANDERSON, J. D., JR.
Numerical investigation of supersonic base flow with parallel injection
[AIAA PAPER 82-1001] A82-31960

ANGLIN, E. L.
Wing flap-type control effectiveness and effects of control hinge gap seals for a supercritical wing
[AIAA PAPER 82-0960] A82-34008

AOKI, T.
Mach reflection of a shock wave from an inclined wall
A82-34748

ARDEMA, M. D.
Barriers and dispersal surfaces in minimum-time interception
[NASA-TM-84241] N82-25262

ASH, R. L.
Solid state crash survivable flight data recorders for mishap investigation
N82-25173

ASTLEY, I.
Formability of INCOLOY alloy MA 956 - An oxide dispersion strengthened sheet alloy
A82-33994

AYERS, T. G.
Review of the 1980 Wind-Tunnel/Flight Correlation Panel
N82-25198

B

BAALS, D. D.
Wind-Tunnel/Flight Correlation, 1981
[NASA-CP-2225] N82-25196

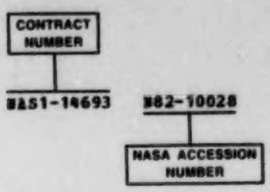
CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 152)* SEPTEMBER 1982

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

layouts. The prototype philosophy is considered a low-cost, effective method of demonstrating new engine features and configurations, as well as 'proof of concept'. It is pointed out that when the prototype is used, an adequate time period should be allowed for engine redesign prior to beginning a full-scale development program. Completing aerodynamic development before or shortly after beginning full-scale development permits concentration on the controls system and on durability development without frequent changes. It is also pointed out that the definition of engine failure modes requires a mix of test schedules to probe design sensitivity to various stimuli. C.R.

A82-35046 # Development of engine operability. T. J. Christie (United Technologies Corp., Government Products Div., West Palm Beach, FL). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1181.* 11 p.

An important criterion in connection with the selection of an engine for advanced aircraft weapon systems is related to operability. Good operability is the ability of the engine to perform flawlessly in all aspects of the mission. The various areas of engine operability are explored, taking into account potential design solutions for advanced engine systems. Aspects of engine airstarting capability are considered, giving attention to the compressor, the utilization of digital electronic control, and the bearing support system. The engine thrust response is discussed along with the solution of engine stall problems, taking into consideration fan and compressor, the augmentor, and control components. Problems related to the occurrence of nonrecoverable stall are also explored. It is pointed out that to ensure adequate engine operability for the next generation of air superiority fighters, it is imperative to modify the engine development program. The required changes are discussed. G.R.

A82-35047 # Control of gas turbine power transients for improved turbine airfoil durability. R. R. Sellers (United Technologies Corp., Government Products Div., West Palm Beach, FL). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1182.* 11 p.

It is noted that today's advanced military fighter engines are demonstrating thrust-to-weight ratios of 8 to 1 and that fighter engine requirements exceeding 10 to 1 are forecast. In practice, this increase in thrust-to-weight ratio has been achieved in large part by increasing the level of the combustor exit temperature. Low cycle fatigue has thus become a lift-limiting factor in turbine airfoils because of this increased combustor exit temperature and the increased number of major throttle transients. A test facility that can provide the engine data base necessary for improving turbine airfoil low-cycle-fatigue life predictions is described. C.R.

A82-35048 # T700 - Modern development test techniques, lessons learned and results. R. A. Dangelmaier (General Electric Co., Aircraft Engine Business Group, Lynn, MA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1183.* 10 p.

The testing of the T700 engine is discussed. The 300-hr model qualification test required the engine to withstand low cycle fatigue cycles, thermal cycles, ingestion of various objects and substances including liquid water, ice, sand, and birds, and to meet hot and cold start criteria. The engine was measured for overtemperature, smoke emission and corrosion susceptibility. Abusive vibration testing, inlet and exhaust system evaluation, and suction fuel system examination was also done. Pre-production engine ground and flight testing was done in a number of aircraft. This was followed by a two-year maturity/life verification program in order to further assure a high level of life, durability, reliability, and maturity at the time of production introduction in 1978. Accelerated endurance and accelerated mission testing was done. Problems uncovered and corrected during the testing are discussed. C.R.

A82-35049 # Next generation trainer /NGT/ engine requirements - An application of lessons learned. C. J. Bauer (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1184.* 7 p.

A new, four-step approach for turbine engine development is described, as well as the new Engine Structural Integrity Program (ENSIP). Instead of the former two-step qualification process including a preliminary flight rating test and a model qualification test, the new concept emphasizes definition and verification of field maintenance procedures and parts life limits. It includes an initial flight release, full flight release, initial service release, and operational capacity release, each of which is briefly described. ENSIP encompasses five tasks: (1) design information; (2) design analysis, component and materials characterization; (3) component and core engine testing; (4) ground and flight testing; and (5) product quality control and engine life management. The integration of the former procedure with the new concept and procedure is discussed. C.D.

A82-35067 # A concept for light-powered flight. L. N. Myrabo (BDM Corp., McLean, VA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1214.* 20 p. 22 refs.

The concept for an advanced flight transport vehicle propelled by variable cycle laser propulsion engines is described. The vehicle is designed for efficient propulsion both within the atmosphere (by momentum exchange) and in space (as a rocket). Pulsed laser power is absorbed directly into gaseous reaction propellants by electrical gas breakdown and inverse Bremsstrahlung. Small scale experiments on each key engine component have been performed, and their performance characteristics are known. Innovation results from the synergism of the various engine parts. The resultant system can demonstrate substantial performance improvements over conventional chemical thrusters and flight vehicle configurations - in a future era of plentiful beamed space power. (Author)

A82-35076 # Aircraft fire safety research with antimisting fuels - Status report. E. P. Klueg, B. C. Fenton, and S. L. Imbrogno (FAA, Technical Center, Atlantic City, NJ). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1235.* 26 p. 18 refs.

Laboratory tests have been developed which characterize the antimisting, filtration, and flammability properties and the degradation level of antimisting kerosene (AMK). Interrelations among rheological, physical, and flammability properties and production and compatibility characteristics of antimisting additives are discussed. Problems caused by addition of water to AMK are studied, as are the tendency of AMK to form gel under conditions of cold temperature and shear. AMK is found to provide very significant fire protection benefits under impact survivable crash conditions. Problems of in-line blending of antimisting additive FM-9 and of airframe fuel system hardware incompatibilities are surmountable. Turbine engines can operate on FM-9 and meet performance criteria provided the fuel is highly degraded, which does not present insurmountable problems. C.D.

A82-35077 # Will hydrogen-fueled aircraft be safe. G. D. Brewer (Lockheed-California Co., Burbank, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1236.* 6 p. 9 refs.

Analysis has shown that liquid hydrogen will be significantly safer than liquid methane and synjet, the other alternative fuels for aircraft. With LH2 there will be less risk of a major spill occurring in event of a crash in which passengers can survive the impact. If fuel is spilled, and assuming ignition does not occur, LH2 will not spread as far before it vaporizes, becomes buoyant, and dissipates in the atmosphere. If the spilled fuel is ignited, as will occur more than 80 percent of the time with any of the fuels, the resulting hydrogen fire will be of such short duration and will be confined to such a small area that the passenger survival rate can be expected to be much higher. (Author)

A82-35078 # Icing conditions on sea level gas turbine engine test stands. H. J. Willcocks (United Technologies Corp., Government Products Div., West Palm Beach, FL). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1237.* 7 p. 7 refs.

Engine icing conditions are discussed and various methods of icing prevention are compared. Icing can be caused by a drop in the static temperature within the engine inlet duct or by increase of relative humidity with increasing Mach number till saturation. Two types of icing exist, engine face icing and general stand icing, which includes engine face icing. Stand inlet heaters are found to provide the best solution to engine face and general stand icing, but are not cost-effective to use for icing alone. Engine running appears useful for engine face icing but is hazardous when general stand icing is present. An ice detector rig is described which will discriminate between the two types of icing, and so permit running the engine when appropriate. C.D.

A82-35079 # Model test and full scale checkout of dry-cooled jet runup sound suppressors. J. L. Grunnet (FluiDyne Engineering Corp., Minneapolis, MN) and E. Ference (U.S. Navy, Naval Facilities Engineering Command, Alexandria, VA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1239.* 12 p. 7 refs.

This paper describes the design, model testing and full-scale checkout of hush house type jet aircraft runup sound suppressors. This hush house concept features: complete enclosure of the aircraft, dry cooling of the exhaust sound suppressor even during afterburning, and adaptability of one enclosure to a variety of aircraft types. The comparison of model test data and full-scale checkout data (exhaust system temperatures, air flow rates and exhaust sound suppression) is emphasized in the paper. Also the extension of the concept to unusual aircraft designs and to dry-cooled engine test cells are covered. (Author)

A82-35080 * # Increased capabilities of the Langley Mach 7 Scramjet Test Facility. S. R. Thomas and R. W. Guy (NASA, Langley Research Center, Hampton, VA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1240.* 13 p. 15 refs.

An experimental research program which explored the potential for expanding the operating range of NASA Langley's Mach 7 Scramjet Test Facility is described. The facility uses electric arc-heated air as the test gas and is configured for testing airframe-integrated scramjet engine models at conditions duplicating flight velocities and temperatures. Previous scramjet testing in this facility was limited to a single simulated flight condition of Mach 6.9 at 115,300 ft. altitude.

The present arc heater research demonstrated that the facility can be used for scramjet testing at simulated flight conditions from Mach 4 (at altitudes from 77,000 to 114,000 ft.) to Mach 7 (at altitudes from 108,000 to 149,000 ft.). Flow quality was established from the uniformity of measured total temperature profiles. In addition, nitrogen oxide levels in the test stream were determined for relating engine test data to expected flight performance. The test frequency and reliability of the facility were also improved by a novel redesign of the heater downstream electrode and by defining limits for stable arc operation. (Author)

A82-35089 # **Characteristics of a side dump gas generator ramjet.** P. R. Choudhury (Southern California, University, Los Angeles, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1258.* 5 p. 7 refs. Grant No. AF-AFOSR-77-3354.

This paper deals with an experimental study of a small side dump gas generator ramjet whose geometric characteristics and flow field were changed parametrically to investigate the interaction of vortices and stable burning in the combustor. Vortices were perturbed and the size of the recirculation zone reduced by external means. The results show that the vortices at the head are crucial to stable and oscillation free operation. Axial fuel injection at the head and the introduction of swirl by canting the inlets tend to weaken the system of vortices at the head and thereby degrade the burner performance. Secondary vortices downstream of the dump plane are weak and cannot function properly without the recirculation zone at the head acting as a 'pilot flame'. A well designed side dump burner can operate satisfactorily at low IR and visible signatures in the exhaust. Although the burner was not choked at the exit plane, it is felt that the mutual interaction of vortices would not change significantly for the choked case and the conclusions from this study would aid in designing a real side dump propulsion system. (Author)

A82-35091 * # **A comprehensive method for preliminary design optimization of axial gas turbine stages.** R. M. Jenkins (Tuskegee Institute, Tuskegee, AL). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1264.* 11 p. 15 refs. Grant No. NsG-3295.

A method is presented that performs a rapid, reasonably accurate preliminary pitchline optimization of axial gas turbine annular flowpath geometry, as well as an initial estimate of blade profile shapes, given only a minimum of thermodynamic cycle requirements. No geometric parameters need be specified. The following preliminary design data are determined: (1) the optimum flowpath geometry, within mechanical stress limits; (2) initial estimates of cascade blade shapes; (3) predictions of expected turbine performance. The method uses an inverse calculation technique whereby blade profiles are generated by designing channels to yield a specified velocity distribution on the two walls. Velocity distributions are then used to calculate the cascade loss parameters. Calculated blade shapes are used primarily to determine whether the assumed velocity loadings are physically realistic. Model verification is accomplished by comparison of predicted turbine geometry and performance with four existing single stage turbines. C.D.

A82-35100 # **Individual bypass throttling in fighter engines.** H. Kuenkler (Industrieanlagen-Betriebsgesellschaft mbH, Ottobrunn, West Germany). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1265.* 9 p.

It is demonstrated that individual bypass throttling (IBT) by an independent bypass nozzle/throttle device is an attractive means of influencing partload specific fuel consumption characteristics in low bypass ratio turbofan engines, such as those of fighter aircraft, without introducing turbocomponent variable-geometry features. An IBT application is considered in which total engine pressure ratio as well as bypass ratio have been selected with a view to high thrust characteristics and optimum reheat conditions, while the low-partload specific fuel consumption was decreased by means of the IBT feature. The calculated total propulsive weight for both long-loiter and interception fighter missions shows that the more complex construction of a separate bypass nozzle will be compensated by the new engine design's efficiency. An 8% takeoff weight saving was attained by the IBT engine over a conventional design for the two missions considered. O.C.

A82-35101 # **Combat survivability in the Advanced Technology Engine Study /ATES/.** L. Throndson (U.S. Naval Weapons Center, China Lake, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1287.* 9 p.

The Advanced Technology Engine Study (ATES) has shown that the advanced tactical aircraft used as study baselines will have high survivability in year-2000 combat scenarios which include advanced missile threats in high densities. Reductions in radar cross section and infrared signature greater than 50%, however, are required for significant reductions in combat attrition losses. Cost studies indicate that configurations requiring extensive modification for low observables should be avoided, in favor of 15-year peacetime life cycle cost vehicles possessing low radar and infrared detectability features from the outset of design formulation. Attention is given to engine cycle, bypass configuration and nozzle design elements of infrared signature reduction, as well as requirements for radar cross section reduction in engine inlet and nozzle design. O.C.

A82-35102 # **Turbine stage heat flux measurements.** M. G. Dunn (Calspan Advanced Technology Center, Buffalo, NY) and J. L. Holt (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1289.* 8 p. 30 refs. Contract No. F33615-81-C-2017.

This paper describes an ongoing effort at Calspan designed to obtain detailed heat transfer data for a full-stage rotating turbine. A description of the accompanying analysis effort intended to define the range of validity of the various predictive methods is also presented. The experiments are performed using a shock tunnel as a short-duration source of heated air which is used to drive a test-section device containing the high-pressure stage of the Garrett TFE 731-2 turbine. The turbine is extensively instrumented with thin-film heat-transfer gauges. Heat-flux distributions have been obtained at the turbine design flow function and 100% corrected speed for values of the ratio of the wall temperature to the total temperature in the range of 0.2 to 0.3. (Author)

A82-35233 **Ultralight airplanes.** M. A. Markowski. *Scientific American,* vol. 247, July 1982, p. 62-68.

The typical design features and performance capabilities of ultralight aircraft, which incorporate a small reciprocating engine on a hang glider airframe and may be flown without a pilot's license, are described. Designs of this class, of which more than 10,000 were sold in 1981, generally have an empty weight of 200 lbs, a wingspan of more than 30 ft, and cruising and stalling speeds of 50 and 25 mph, respectively. Glide ratios better than 9:1 and 500 ft/min rates of climb have been achieved. After a brief historical account of ultralight-like aircraft development, attention is given to the aerodynamic and propulsion-system features of a variety of popular configurations. It is noted that great care must be taken by ultralight pilots of wind conditions, because of their crafts' high sensitivity to gusts. Extant ultralight configurations are illustrated with attention to performance-maximizing features. O.C.

A82-35256 **A laboratory mock-up ultrasonic inspection system for composites.** F. H. Chang (General Dynamics Materials Research Laboratory, Fort Worth, TX), J. R. Bell, A. H. Gardner, C. P. Fisher, and R. W. Haile. *Materials Evaluation,* vol. 40, June 1982, p. 756-761. Contract No. F33615-77-C-5206.

The use of advanced composite materials in aircraft structures offers distinct advantages in terms of reduced weight, increased performance, lower cost, and higher structural reliability. The complexity of the advanced composite structures increases the degree of difficulty for nondestructive testing (NDT) and inspection. The major NDT techniques for composite structure inspection are ultrasonics and radiography. In connection with requirements for the low-cost inspection of large areas for small flaws, a need exists for an in-service inspection system for composites which will record the flaw location in a pseudo real-time C-scan while minimizing the operator effort to attain a high level of inspection reliability. In 1978 a program was initiated with the aim to develop such an in-service inspection system (ISIS) for advanced composite aircraft structure. A description is given of a laboratory mock-up model of the ISIS. G.R.

A82-35257 **Acoustic emission in jet engine fan blades.** E. v. K. Hill (Clemson University, Clemson, SC) and D. M. Egle (Oklahoma, University, Norman, OK). *(American Society for Nondestructive Testing, Fall Conference, Atlanta, GA, Oct. 1981.) Materials Evaluation,* vol. 40, June 1982, p. 770-773. 10 refs. Contract No. F34601-78-C-2826.

Titanium alloys, in connection with their low density and, in general, good mechanical properties at high temperatures, are particularly popular for applications in high performance military aircraft. However, unfortunately these materials exhibit also low fracture toughness which can often lead to sudden failure of components without warning. An enhancement of nondestructive test procedures to reduce damage related to the failure of compressors in turbofan engines proved to be only partly successful. A test program was, therefore, developed for the study of flaw growth in fan blades using acoustic emission (AE). It was found through testing that AE can detect the presence of flaws even when conventional techniques cannot. Moreover, it can sense them long before they become critical. Therefore, it is believed that with a proper development program, acoustic emission could be the best nondestructive test technique for sensing flaws in jet engine fan blades. G.R.

A82-35278 # **F-14 inlet development experience.** R. H. Tindell, C. A. Hoelzer (Grumman Aerospace Corp., Bethpage, NY), and D. Alexander (U.S. Naval Air Systems Command, Washington, DC). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-5.* 11 p. Members, $2.00; nonmembers, $4.00.

The inlet control system of the F-14 fighter, which has demonstrated in-flight compatibility with the advanced F401-PW-400 and GE-F-101X engines, as well as the TF30 engine, is based on a simple concept that minimizes maintenance

AV-8B, and the F-4 to test the range of the combined method are indicated. M.S.K.

A82-35565 # A series of airfoils designed by transonic drag minimization for Gates Learjet aircraft. M. L. Hinson (Gates Learjet Corp., Wichita, KS) In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 489-509. 13 refs.

Airfoils designed for reduced transonic drag using various versions of numerical optimization programs are described and compared with experimental results. Focussing on evolutionary models of the Gates Learjet, efforts to find an airfoil to replace the currently used NACA 64A109 profile are explored. Noting a preference for flight around Mach 0.81 and the long range cruise design point of Mach 0.7, efforts were made to maintain low stall speeds, eliminate aileron buzz, minimize the structural components which needed changing, and fit the new wing within existing contours. The CONMIN constrained function minimization program was employed to find a minimum value of an objective function and simultaneously satisfy a set of constraints such as drag coefficient. FLO-6 was employed for aerodynamic parameters. One- and two-point optimization results are given for airfoils chosen and wind tunnel tests. Five airfoils with reduced drag were constructed. M.S.K.

A82-35566 # Applied computational transonics - Capabilities and limitations. P. A. Henne, J. A. Dahlin, and C. C. Peavey (Douglas Aircraft Co., Long Beach, CA) In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 511-543. 19 refs.

Computational transonic methods which feature nonconservative solution of the full-potential equation for airfoils and wings are examined from the viewpoint of utilization in a production framework. Attention is given to direct solutions in defining the aerodynamic flow about a body and to inverse solutions obtained in the design process. The direct solutions comprise the Program H and FLO-22 codes and involve finite difference schemes to describe the potential flow. The concept of surface transpiration is the basis for the two- and three-dimensional inverse methods, those of Tranen and Henne, respectively. Direct solutions entail simulation of viscous effects through boundary layer additions to the airfoil surface, in addition to approximate fuselage volume and cross flow effects in the three-dimensional case. Inverse methods require the inclusion of the capability of airfoils to produce shocks. Comparisons are made between predicted and observed airfoil performance in transonic flows. M.S.K.

A82-35567 # Evaluation of full potential flow methods for the design and analysis of transport wings. L. R. Miranda (Lockheed-California Co., Burbank, CA) In: Transonic aerodynamics; Transonic Perspective Symposium, Moffett Field, CA, February 18-20, 1981, Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 545-561.

The applicability and limitations present with the use of currently available full potential flow computer codes for the analysis of transport-type wings in the transonic regime are investigated. It is noted that the design process involves definition of the target pressure distributions for analytical generation of a tentative design which is then analyzed numerically through the available codes. The FLO-22 scheme employs a nonconservative difference scheme with a computational grid generated by a series of sheared and parabolic coordinate transformations. The FLO-28 and -30 codes are based on the finite volume conservative difference scheme. Use of the three schemes for the design of a wing and subsequent verification in the NASA-Ames Transonic Tunnel is described. Inclusion of viscous effects was found to enhance the accuracy of the modeling process. M.S.K.

A82-35727 Triggered lightning. D. W. Clifford (McDonnell Aircraft Co., St. Louis, MO) and H. W. Kasemir (Colorado Scientific Research Corp., Berthoud, CO). *IEEE Transactions on Electromagnetic Compatibility*, vol. EMC-24, May 1982, pt. 1, p. 112-122. 41 refs.

The present investigation is concerned with the possible triggering of lightning as a result of introducing an aircraft or other aerospace vehicle into the atmospheric electrical system, taking into account the study of natural lightning processes reported by Uman and Krider (1981). The evidence and arguments for aircraft-triggered lightning are reviewed, drawing upon the ground-based triggering experience for insights into the triggering process. The triggering arguments which have been advanced are examined and compared with in-flight lightning-strike reports to deduce the flight and weather conditions most likely to produce triggered lightning. Based upon the conclusions drawn about the triggering process, the probable characteristics of aircraft-triggered lightning are discussed in light of their effects on aircraft safety. G.R.

A82-35729 Airborne warning systems for natural and aircraft-initiated lightning. L. W. Parker (Lee W. Parker, Inc., Concord, MA) and H. W. Kasemir (Colorado Scientific Research Corp., Berthoud, CO). *IEEE Transactions on Electromagnetic Compatibility*, vol. EMC-24, May 1982, pt. 1, p. 137-156. 83 refs. Contract No. F19628-79-C-0161.

A needs exists for reliable and inexpensive (light-weight) airborne lightning warning and avoidance systems. In one application of such a system warnings would be provided of distant storms, enabling a pilot to avoid severe weather. In another application warnings of possible imminent lightning strikes would be given to the aircraft in electrified clouds. Two general classes of lightning warning systems are considered, including systems providing distant warnings and systems giving near-zone warnings. Dectors providing near-range warnings are discussed. These are electrostatic-field detectors which can be useful for warning and avoidance of lightning strikes to the aircraft. They warn of the presence of high electric fields. A description is also given of detectors providing distant warnings. Attention is given to RF sferics bearing detection (direction-finding) by magnetic loops, HF-VHF-UHF bearing detectors, optical bearing detectors, RF-sferics range detection, and bearing errors. G.R.

A82-35730 The direct effects of lightning on aircraft. J. A. Plumer (Lightning Technologies, Inc., Pittsfield, MA) and J. D. Robb (Lightning and Transients Research Institute, St. Paul, MN). *IEEE Transactions on Electromagnetic Compatibility*, vol. EMC-24, May 1982, pt. 1, p. 158-172. 24 refs.

In the case of early wooden aircraft, lightning could produce catastrophic results. However, the conventional aluminum airframes of the aircraft replacing the early aircraft types have, by virture of their excellent electrical conductivity, rarely suffered critical damage from lightning strikes. But now the situation is changing again with the advent of aircraft constructed partly (and sometimes entirely) of new, fiber-reinforced plastics with desirable lightweight and high-strength properties, but with poor electrical conductivity. The designers of nonmetallic structures must, therefore, give particular attention to the lightning environment, taking positive measures to protect against its adverse effects lest safety of flight be endangered. A review is conducted of the physical-damage effects, called direct effects, of lightning on aircraft structures and fuel systems, taking into account the implementation of basic protective methods. Attention is given to metallic structures, nonmetallic structures, and fuel systems. G.R.

A82-35731 Electromagnetic interaction of lightning with aircraft. R. A. Perala, T. Rudolph, and F. Eriksen (Electro-Magnetic Applications, Inc., Denver, CO). *IEEE Transactions on Electromagnetic Compatibility*, vol. EMC-24, May 1982, pt. 1, p. 173-203. 127 refs.

The electromagnetic interaction of lightning with aircraft is a complex event. Because of new aircraft technologies, it is becoming more important to be able to predict and understand lightning-induced transients on avionics systems. In this paper, a review of state-of-the-art of lightning-interaction modeling is presented. The overall interaction process is discussed, and specific modeling techniques are given for external interaction, internal interaction, and internal propagation. Some examples are given for lightning strokes attached to an aircraft. A discussion of nonlinear effects is also given, and comparison between nuclear electromagnetic pulse and lightning environments are presented. Finally, an overview of hardening techniques is given. An extensive bibliography is included. (Author)

A82-35732 Static charging and its effects on avionic systems. J. E. Nanevicz (SRI International Electromagnetic Sciences Laboratory, Menlo Park, CA). *IEEE Transactions on Electromagnetic Compatibility*, vol. EMC-24, May 1982, pt. 1, p. 203-209. 15 refs.

It is pointed out that the effects of electrostatic charging first became apparent when aircraft began operation under all-weather conditions. Frictional charging of the aircraft occurred when precipitation particles struck the aircraft and deposited a charge on its surface. The charging, in turn, led to electrical discharges from the aircraft, which generated noise which interfered with the communication and navigation equipment. Techniques were developed to mitigate the undesirable effects of charging and discharging processes. Investigations related to the occurrence of static electrification are discussed, and a description is provided of interference sources and their effects on systems. Attention is given to corona discharges, streamer discharges, discharges from helicopter blades, and spark discharges. G.R.

A82-35733 Lightning simulation and testing. D. W. Clifford, E. H. Schulte (McDonnell Aircraft Co., St. Louis, MO), and K. E. Crouch (Lightning Technologies, Inc., Pittsfield, MA). *IEEE Transactions on Electromagnetic Compatibility*, vol. EMC-24, May 1982, pt. 1, p. 209-224. 34 refs.

Laboratory simulation testing is relied upon for assessing the effects of lightning on aircraft and other aerospace systems. This paper reviews the laboratory equipment, techniques, and test waveforms used in simulating the important effects of atmospheric electricity on aerospace systems. Test criteria and techniques are well established for simulating the direct physical damage effects of lightning, but tests for determining the indirect, induced-coupling effects of lightning are still in the development stage. These last tests are necessary for evaluating the effects of the lightning environment on modern aircraft which make extensive use of computerized flight-control systems. (Author)

A82-35734 **Assessment of aircraft susceptibility/vulnerability to lightning and development of lightning-protection design criteria.** J. C. Corbin (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) and W. W. Cooley (Boeing Military Airplane Co., Seattle, WA). *IEEE Transactions on Electromagnetic Compatibility*, vol. EMC-24, May 1982, pt. 1, p. 225-237. 21 refs.

Possible approaches for assessing the susceptibility/vulnerability of aircraft to both the direct and indirect (induced) effects of lightning and for developing lightning-protection design criteria are examined. Particular emphasis is focused on methods that can be used to achieve a high level of confidence in aircraft safety and survival. Assessment factors and their uncertainties are qualitatively and quantitatively discussed. Lightning-protection design approaches involving both test and analysis as applied to the F-16 fighter aircraft and the NASA Space Shuttle are reviewed. A probabilistic or statistical approach is outlined (with examples) for predicting single and/or redundant equipment failure due to indirect lightning effects. (Author)

A82-35767 # **Laser application in weapon guidance and active imaging.** V. V. Rampal (Instruments Research and Development Establishment, Dehra Dun, India). *Indian Journal of Physics, Section B*, vol. 54B, no. 4-5, Aug.-Oct. 1980, p. 465-470. 10 refs.

The application of lasers in weapon guidance and active imaging is reviewed. Modern low flying aircraft used for ground attack are fitted with suitable laser instrumentation to provide range finding and target capabilities for seeking the target, and to measure its range, sending the weapon into it and thus reducing human element to the minimum. The principle of laser guidance is discussed, and the cost effectiveness of the weapon system is considered. Laser imaging using a high average power Nd YAG laser is described, and evidence for the possibility of using high repetition rate pulsed lasers for illumination and imaging of distant targets at night is presented. D.L.G.

A82-35820 # **Aerodynamic lag functions, divergence, and the British flutter method.** W. P. Rodden and E. D. Bellinger (MacNeal-Schwendler Corp., Los Angeles, CA). *Journal of Aircraft*, vol. 19, July 1982, p. 596-598. 18 refs.

Results of calculations of flutter and divergence instabilities for a two-dimensional airfoil are presented in a comparison of the transient method, which includes the transient aerodynamic representation explicitly, and the British flutter method, which only includes transient aerodynamics implicitly. The calculations involve airfoils mounted on bending and torsion springs, with the center of gravity located at 37% or 45% chord, aerodynamic center at 25% chord, and elastic axis at 40% chord. Both the transient and the British flutter method using either the exact Theodorsen function or the Jones approximation to the Theodorsen function show that flutter occurs when the torsion root becomes unstable, whereas divergence occurs when an aerodynamic lag root becomes unstable. It is concluded that the British flutter method adequately predicts all of the instabilities of aeroelastic systems without any need for approximations to aerodynamic transfer functions. S.C.S.

A82-35821 # **STOL aircraft response to turbulence generated by a tall upwind building.** L. D. Reid (Toronto, University, Toronto, Canada). *Journal of Aircraft*, vol. 19, July 1982, p. 601-603. 8 refs. Research supported by Environment Canada and Natural Sciences and Engineering Research Council of Canada.

The influence of building-induced turbulence on the landing approach of an STOL aircraft is predicted by the use of the turbulence correlation technique. Measurements of turbulence intensity and the turbulence correlation matrix were made in a planetary boundary layer wind tunnel with a simulated 152.4-m tall building and a steep (15-deg) glideslope located in the wind field. Calculations based on the measured turbulence correlation matrix for the case of a twin-engine turboprop light STOL transport executing a constant airspeed landing approach with fixed controls in the presence of a constant headwind indicate the presence of the building to result in a general increase in the dispersion of the longitudinal state vector of the aircraft, with the extent of increase becoming greater towards the bottom of the glideslope as the aircraft nears the building. It is noted, however, that the upwind building has only a minor impact on the turbulence-induced disturbance to the landing approach. S.C.S.

A82-35869 **Multiple aircraft tracking system for coordinated research missions.** P. N. Johnson and J. L. Fink (National Center for Atmospheric Research, Boulder, CO). *American Meteorological Society, Bulletin*, vol. 63, May 1982, p. 487-491.

The Multiple Aircraft Position System was developed in response to the need for aircraft position in the coordination of large field projects involving several research aircraft. Radio interferometer techniques are used to provide rapid, accurate determination of positions for up to 10 aircraft furnished with special airborne radio beacons. Three remote interferometer array sites receive the signals from the airborne beacons, each transmitting at a unique frequency. Each remote site is tuned to one beacon frequency at a time according to a programmable polling sequence; several phase difference measurements are made from the received signal. These data then are telemetered to a central control station where they are transferred to a computer that calculates the direction cosines from each remote site to the airborne beacon, and thus determines the position of the beacon. The aircraft positions then are immediately available for display. (Author)

A82-35874 † **The effect of erosion wear on the vibration characteristics of axial-turbine blades (Vliianie erozionnogo iznosa na vibratsionnye kharakteristiki lopatok osevykh turbomashin).** R. G. Perel'man, V. V. Bodryshev, V. V. Priokhin, E. B. Karpin, L. V. Matrosova, and V. N. Chebotarev (Moskovskii Aviatsionnyi Institut, Moscow; Ob'edinenie Kaluzhskii Turbinnyi Zavod, Kaluga, USSR). *Energetika*, Apr. 1982, p. 60-64. 5 refs. In Russian.

A variational method based on the theory of twisted rods with nonrectilinear axis is used to analyze the effect of erosion wear on the vibration characteristics of axial-turbine blades. It is shown that relative variations of vibration frequencies of free blades for static and dynamic modes of operation almost coincide. Theoretical results agree well with experimental data. B.J.

A82-35876 **Certification of an airborne Loran-C navigation system.** F. D. MacKenzie (U.S. Department of Transportation, Transportation Systems Center, Cambridge, MA). *Navigation*, vol. 29, Spring 1982, p. 69-79. 5 refs. Research supported by the Research and Special Programs Administration.

The requirements, FAA approval process, testing, and analysis which led to acceptance of a Loran-C navigational system certification for the state of Vermont are detailed. NASA personnel from Langley Research Center designed, fabricated, installed, and calibrated the on-board data collection instrumentation, as well as the software for analysis of the airborne and ground-based records. Flights were required during visual and instrument conditions, day and night, through all seasons, and during twilight conditions, while the Loran-C signal characteristics were measured at ground stations for EM compatibility, predictability, temporal stability, and ease of airborne acquisition. Standard deviations were either calculated or measured for the equipment, for parts of the system, and for the pilot's contribution to the errors. The Loran-C system was determined to meet or exceed all relevant criteria. M.S.K.

A82-35881 **Propellers come full circle.** R. DeMeis. *High Technology*, vol. 2, July-Aug. 1982, p. 16-18.

The use of the propfan in future aircraft is discussed. With the large external fan generating more thrust per engine revolution than a small internal fan, propfan jets could achieve fuel savings as high as 25 percent in commercial operations and 35 percent for military patrol missions, while retaining the vibration-free operation and mechanical simplicity of turbojet engine cores. The propfan would have as many as 12 stiff composite blades that would be highly swept, thinner, and shorter than conventional blades in order to reduce noise and drag. The gearbox would be reintroduced to permit operation at maximum efficiency with the best blade rotation speed for the airflow conditions. A double-wall insulated fuselage and shaped wing-nacelle interface would deal with internal aircraft noise and propfan-swept wing integration problems. The development of the propfan may depend on continued government funding to NASA's program. C.D.

A82-36047 # **Prospects for Navsat - A future worldwide civil navigation-satellite system.** C. Rosetti (ESA, Directorate of Applications Programmes, Paris, France). *ESA Bulletin*, no. 30, May 1982, p. 54-59.

Air navigational problems which inhibit flying optimal routes and which could be aided by a worldwide navigational satellite system (Navsat) are examined. Satellite systems are noted to alleviate ground- and air-based equipment constraints for the airlines, developing nations in need of mapping assistance, offshore oil drilling operations, and geodetic surveys. A Navsat system, following the design adopted by military GPS operations, involves a receiver capable of detecting time-lapsed signals from well-positioned satellites. The transmission is broadcast in terms of a lock-on signal and a signal carrying tens of bits/sec of information regarding ephemerides. Either mobile or fixed receivers can gain precise location data by tuning in to two or three satellites simultaneously. A potential system involving 24 satellites is described, which would offer 95.6% availability from anywhere on earth. M.S.K.

A82-36054 **Aircraft measurements of icing in supercooled and water droplet/ice crystal clouds.** M. Bain and J. F. Gayet (Clermont-Ferrand II, Université, Aubière, Puy-de-Dôme, France). *Journal of Applied Meteorology*, vol. 21, May 1982, p. 631-641. 19 refs. Direction des Recherches, Etudes et Techniques *Contract No. 79-34-183.*

Some results of icing rate measurements connected with meteorological parameters during penetrations into stratiform and cumuliform clouds are described. Icing measurements were carried out in Spain during a precipitation enhancement project experiment in 1979, using an instrumented DC-7 aircraft. The meteorological parameters determined include the temperature, concentration of large ice particles, liquid water content, cloud droplet concentration, and median volume diameter. The energy balance at the riming surface of a cylinder is analyzed and the critical liquid water concentration determined in order to predict the ice growth regime (wet or dry), with an 85 percent success rate. An for addition of area navigation capability are reported. The receiver is an envelope processor, offering simplicity of RF processor circuitry. Author

COMMUTATED AUTOMATIC GAIN CONTROL SYSTEM

Stephen R. Yost *In* NASA. Langley Research Center Joint Univ. Program for Air Transportation Res., 1981 Jun. 1982 p 139-155 refs
Avail: NTIS HC A11/MF A01 CSCL 17G

The commutated automatic gain control (AGC) system was designed and built for the prototype Loran-C receiver is discussed. The current version of the prototype receiver, the Mini L-80, was tested initially in 1980. The receiver uses a super jolt microcomputer to control a memory aided phase loop (MAPLL). The microcomputer also controls the input/output, latitude/longitude conversion, and the recently added AGC system. The AGC control adjusts the level of each station signal, such that the early portion of each envelope rise is about at the same amplitude in the receiver envelope detector. Author

OPERATING MANUAL HOLOGRAPHIC INTERFEROMETRY SYSTEM FOR 2 X 2 FOOT TRANSONIC WIND TUNNEL Final Report
James E. Craig Nov. 1981 58 p
(Contract NAS2-10297)
(NASA-CR-166344; NAS 1.26:166344; SDL-81-52002) Avail: NTIS HC A04/MF A01 CSCL 01B

A holographic interferometer system was installed in a 2X2 foot transonic wind tunnel. The system incorporates a modern, 10 pps, Nd:YAG pulsed laser which provides reliable operation and is easy to align. The spatial filtering requirements of the unstable resonator beam are described as well as the integration of the system into the existing Schieren system. A two plate holographic interferometer is used to reconstruct flow field data. For static wind tunnel models the single exposure holograms are recorded in the usual manner; however, for dynamic models such as oscillating airfoils, synchronous laser hologram recording is used. SUMMARY AND RECENT RESULTS FROM THE NASA ADVANCED HIGH SPEED PROPELLER RESEARCH PROGRAM

Glenn A. Mitchell and Daniel C. Mikkelson 1982 35 p refs Presented at the 18th Joint Propulsion Conf., Cleveland, 21-23 Jun. 1982; sponsored by AIAA, SAE and ASME
(NASA-TM-82891; E-1269; NAS 1.15:82891) Avail: NTIS HC A03/MF A01 CSCL 01B

Advanced high-speed propellers offer large performance improvements for aircraft that cruise in the Mach 0.7 to 0.8 speed regime. The current status of the NASA research program on high-speed propeller aerodynamics, acoustics, and aeroelastics is described. Recent wind tunnel results for five 8- to 10-blade advanced models are compared with analytical predictions. Test results show that blade sweep was important in achieving net efficiencies near 80 percent at Mach 0.8 and reducing near-field cruise noise by dB. Lifting line and lifting surface aerodynamic analysis codes are under development and some initial lifting line results are compared with propeller force and probe data. Some initial laser velocimeter measurements of the flow field velocities of an 8-bladed 45 deg swept propeller are shown. Experimental aeroelastic results indicate that cascade effects and blade sweep strongly affect propeller aeroelastic characteristics. Comparisons of propeller near-field noise data with linear acoustic theory indicate that the theory adequate predicts near-field noise for subsonic tip speeds but overpredicts the noise for supersonic tip speeds. Potential large gains in propeller efficiency of 7 to 11 percent at Mach 0.8 may be possible with advanced counter-rotation propellers. B.W.

PRELIMINARY STUDY OF GROUND HANDLING CHARACTERISTICS OF BUOYANT QUAD ROTOR (BQR) VEHICLES Final Report

Ronald G. E. Browning Jul. 1980 275 p refs
(Contract NAS2-10448)
(NASA-CR-166130; NAS 1.26:166130) Avail: NTIS HC A12/MF A01 CSCL 01B

A preliminary investigation of mooring concepts appropriate for heavy lift buoyant quad rotor (BQR) vehicles was performed. A review of the evolution of ground handling systems and procedures for all airship types is presented to ensure that appropriate consideration is given to past experiences. Two buoyant quad rotor designs are identified and described. An analysis of wind loads on a moored airship and the effects of these loads on vehicle design is provided. Four mooring concepts are assessed with respect to the airship design, wind loads and mooring site considerations. Basing requirements and applicability of expeditionary mooring at various operational scenarios are addressed. B.W.

MAINTENANCE TRAINING SIMULATOR DESIGN AND ACQUISITION: ISD-DERIVED TRAINING EQUIPMENT DESIGN Interim Report

Rohn J. Hritz and George R. Purifoy, Jr. Brooks AFB, Tex. AFHRL Feb. 1982 80 p
(Contract F33615-78-C-0019; AF Proj. 2361)
(AD-A110871; AFHRL-TP-81-52) Avail: NTIS HC A05/MF A01 CSCL 05/9

A model for documenting training equipment designs derived from an Instructional System Development (ISD) analysis is presented. The model contains blanks to be completed by the ISD analyst(s). Instructions for applying the model are provided. A method for communicating a specific training equipment design to the Simulator System Program Office (SimSPO) after the ISD analysis has established a need for a maintenance trainer is provided. The model provides the ISD analysts an opportunity to specify such design information as (1) characteristics of the target population who will use the trainer, (2) a list of the training objectives to be achieved using the trainer, (3) a list of the tasks to be practiced and/or acquired on the trainer and a list of the malfunctions to be presented by the trainer for isolation and/or correction, (4) a scenario discussing how the trainer will be used to achieve the specified training objectives, (5) a list of the physical and functional characteristics of the components to be represented on the trainer, and (6) a description of the instructional features required on the trainer to facilitate training objective achievement. When utilized, the model will standardize the communication between ISD and SimSPO personnel. Author

THE SORTIE-GENERATION MODEL SYSTEM. VOLUME 2: SORTIE-GENERATION MODEL USER'S GUIDE

John B. Abell, Robert S. Greenberg, and Michael J. Konvalinka Sep. 1981 129 p 6 Vol.
(Contract MDA903-80-C-0554)
(AD-A110898; LMI-DP101-Vol-2) Avail: NTIS HC A07/MF A01 CSCL 15/5

This volume, the second of six volumes, provides sufficient information to allow a user to run the Sortie-Generation Model (SGM). Volume III, Sortie-Generation Model Analyst's Manual, describes the mathematical structures, derivations, assumptions, limitations, and data sources of the SGM at a very detailed level. Volume IV, Sortie-Generation Model Programmer's Manual, specifies the details of the computer programs, file structures, job control language, and operating environment of the SGM. Volume V describes the maintenance subsystem and explains the construction of the maintenance input file to the SGM. Volume VI describes the spares subsystem and shows a user how to build the spares file that is used by the SGM. GRA

A COMPARATIVE STUDY OF NARROWBAND VOCODER ALGORITHMS IN AIR FORCE OPERATIONAL ENVIRONMENTS USING THE DIAGNOSTIC RHYME TEST
E. Singer 6 Jan. 1982 26 p refs
(Contract F19628-80-C-0002)
(AD-A112053; TR-590; ESD-TR-81-334) Avail: NTIS HC A03/MF A01 CSCL 17/2

This report presents a summary of work performed at Lincoln Laboratory aimed at improving the intelligibility of 2.4 kbps vocoders to be used in USAF operational environments. The distortions present in some of these environments, particularly the F-15 fighter aircraft, can place a severe burden on the speech modelling capabilities of contemporary vocoders. To study these effects and the benefits of various algorithmic improvements, the Diagnostic Rhyme Test was used as a means of providing an objective measure of relative system performance. A wide range of areas was explored through the use of real time computer simulations, including the effects of modified analysis and synthesis techniques, design parameter choices, interoperability, and environmental factors. The purpose of this report is to assemble and document the extensive body of DRT data which has been collected and thereby provide a means for the selection of design parameters likely to lead to improved vocoder performance. ELEVATION PLANE ANALYSIS OF ON-AIRCRAFT ANTENNAS
Chong L. Yu and Walter Dennis Burnside Jan. 1982 93 p refs
(Contract N62269-71-C-0296)
(AD-A112373; ESL-3188-2) Avail: NTIS HC A05/MF A01 CSCL 09/5

The radiation patterns, in the elevation plane, of airborne antennas mounted on the aircraft fuselage have been analyzed by modern diffraction theory including wedge diffraction theory and creeping wave theory. It is found that the fuselage shape has a dominant effect on the elevation patterns. In order to analyze a general convex shape, a new approach, 'section matching method', has been developed in which the fuselage profile is described by a set of points. This new method is applied to some general geometrical shapes which approximate aircraft fuselage. The composite elliptical cylinder is the most general model considered. The validity of this method has been verified by modal one more rigorous GTD solutions. Author (GRA)

THE NUMERICAL SOLUTION OF THE NAVIER-STOKES EQUATIONS FOR INCOMPRESSIBLE TURBULENT FLOW OVER AIRFOILS Final Technical Report, Oct. 1979 - Feb. 1981
Harwood A. Hegna Oct. 1981 154 p refs
(AF Proj. 2307)
(AD-A111279; AFWAL-TR-81-3053) Avail: NTIS HC A08/MF A01 CSCL 20/4

Numerical solutions are obtained for two-dimensional incompressible turbulent viscous flow over airfoils of arbitrary geometry. An algebraic eddy viscosity turbulence model based on Prandtl's mixing length theory is modified for separated adverse pressure gradient flows. Finite difference methods for solving the inviscid stream function equation and the incompressible laminar Navier-Stokes equations are used. A finite difference method for solving the Reynolds averaged incompressible turbulent two-dimensional Navier-Stokes equations is employed. The inviscid stream function equation and the Navier-Stokes equations are transformed using a curvilinear transformation. A body-fitted coordinate system with a constant coordinate line defining the airfoil section surface is transformed to a rectangular coordinate system in the transformed or computational plane. An elliptic partial differential Poisson equation for each coordinate is used to generate the coordinate system in the physical plane for arbitrary airfoils. The two-dimensional time dependent Reynolds averaged incompressible Navier-Stokes equations in the primitive variables of velocity and pressure and a Poisson pressure equation are numerically solved. Turbulence is modelled with an adverse pressure gradient eddy viscosity technique. An implicit finite difference method is used to solve the set of transformed partial differential equations. The system of linearized simultaneous difference equations, at each time step, is solved using successive-over-relaxation iteration. GRA

COMPARISON OF NUMERICAL RESULTS AND MEASURED DATA FOR SMOOTH AND INDENTED NOSETIPS
Tsuying Hsieh 14 May 1981 12 p refs
(AD-A111794) Avail: NTIS HC A02/MF A01 CSCL 20/4

Numerical calculations, using an unsteady implicit numerical algorithm which solves either the inviscid or the thin-layer Navier-Stokes equations, were performed for smooth and severely indented nosetips at hypersonic speed and zero angle of attack. The computed results of inviscid and laminar flowfield are compared to wind tunnel measured data for surface pressure, shock location, heat transfer and density distribution in the shock layer. Good agreements between the calculated and measured flowfield are obtained for smooth nosetip without flow separation. Difficulties in the simulation of severely indented nosetips with large separation bubble or sharp corner are discussed.

THE HYDROGRAPHIC AIRBORNE LASER SOUNDER (HALS)
Stephen M. Webb 3 Feb. 1982 12 p refs
(AD-A111027) Avail: NTIS HC A02/MF A01 CSCL 08/10

To provide an increase in hydrographic survey resources the Hydrographic Airborne Laser Sounder is being developed by the Naval Ocean Research and Development Activity (NORDA) under the sponsorship of the Defense Mapping Agency (DMA). The HALS system incorporates a pulsed, scanning blue-green laser and will be flown in a helicopter from a survey ship operated by the U.S. Naval Oceanographic Office (NAVOCEANO). Through the use of statistics in post-flight processing the HALS data will meet survey accuracy standards, more than adequate for safe navigation. NORDA will perform a technical evaluation of HALS and then turn the system over to NAVOCEANO for operation in late 1983. Author (GRA)

COMPARISON OF ANALYTICAL AND WIND-TUNNEL RESULTS FOR FLUTTER AND GUST RESPONSE OF A TRANSPORT WING WITH ACTIVE CONTROLS
Irving Abel, Boyd Perry, III, and Jerry R. Newsom Jun. 1982 47 p refs
(NASA-TP-2010; L-15099; NAS 1.60:2010) Avail: NTIS HC A03/MF A01 CSCL 01C

Two flutter suppression control laws wre designed and tested on a low speed aeroelastic model of a DC-10 derivative wing. Both control laws demontrated increases in flutter speed in excess of 25 percent above the passive wing flutter speed. In addition, one of the control laws was effective in reducing loads due to turbulence generated in the wind tunnel. The effect of variations in gain and phase on the closed-loop performance was measured and is compared with predictions. In general, both flutter and gust response predictions agree reasonably well with experimental data. B.W.

DESIGN OF A DATA ACQUISITION AND REDUCTION SYSTEM FOR FATIGUE TESTING M.S. Thesis
Jerry Wayne Dalton Sep. 1981 64 p refs
(AD-A110612) Avail: NTIS HC A04/MF A01 CSCL 14/2

A data acquisition and reduction system has been created for aircraft materials fatigue testing. The system uses an HP-9835 Desktop Calculator, an HP-2240A Measurement and Control Processor and a Materials Testing System loading machine. Three different computer programs on the HP-9835 are used to analyze material properties, simulate inflight fatigue loading and compute fatigue damage at a stress concentration. The flight loads are selected from Mil Spec 8866 and applied in a random order. The fatigue damage at a stress concentration is calculated from the applied local stresses using Miner's Law. YAWING OF WIND TURBINES WITH BLADE CYCLIC-PITCH VARIATION Final Report, 15 Sep. 1979 - 15 Dec. 1980
K. H. Hohenemser, Andrew H. P. Swift, and David A. Peters Aug. 1981 242 p refs Prepared for Midwest Research Inst., Golden, Colo.
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(DE81-029639; SERI/TR-8085-3-T2) Avail: NTIS HC A11/MF A01

The control system horizontal axis wind turbine is discussed. It incorporates two features: the application of blade cyclic pitch variation adopted from rotorcraft technology, and the use of yaw angle control, not only for wind direction following, but also for rotor speed or torque control. Cyclic pitch variation in a two-bladed rotor relieves the blades of all the gyroscopic and odd harmonic aerodynamic root moments. It makes rapid yaw rates of a two-bladed rotor possible without causing vibratory hub moments and without causing appreciable angular excursions of the blade tip path plane. Due to the allowable rapid yaw rates of wind turbines with blade cyclic pitch variation, the two conventional separate control systems - yaw control for wind direction following and blade feathering control for regulating rotor speed and torque - can be replaced by a system with only a single control variable, the rotor yaw angle. THE BIOLOGICAL DEGRADATION OF SPILLED JET FUELS: A LITERATURE REVIEW Final Report, Jun. - Aug. 1981
Robert E. Carlson Oct. 1981 41 p refs
(AF Proj. 1900)
(AD-A110758; AFESC/ESL-TR-81-50) Avail: NTIS HC A03/MF A01 CSCL 06/6

Biodegradation of many of the components of Air Force fuels does occur, although most studies have been done under laboratory conditions, and the extrapolation of the findings to natural rates of biodegradation is premature. Many factors affect biodegradation rates, including the nature and concentration of the specific hydrocarbon compound, the species of bacteria present and their quantity, and environmental factors such as nutrient availability, temperature, and oxygen concentrations. Initial concerns should be first, the determination of the importance of biodegradation relative to other loss factors such as volatilization and sediment sorption, and second, the determination of the ultimate fate of recalcitrant compounds and their metabolites. INFLUENCE OF METEOROLOGICAL PROCESSES ON THE VERTICALITY OF ELECTRIC FIELDS Final Report, 1 Oct. 1978 - 30 Sep. 1981
Maynard L. Hill 15 Jan. 1982 16 p refs
(Contract N00024-78-C-5384; DA Proj. 1L1-61102-BH-57)
(AD-A111549; APL/ATO-P/MLH82-06; ARO-14830.1-GS) Avail: NTIS HC A02/MF A01 CSCL 04/1

A maneuverable atmospheric probe (MAP) was instrumented with atmospheric electric field sensors and operated at White Sands Missile Range to investigate meteorological affects on the verticality of electric fields. Verticality to within + or - 2 deg was found to be the norm for fair weather conditions that included a high degree of convective instability. Near a large mountain peak, it was observed that the field contours are favorable for deriving information that is useful for preventing collisions of aircraft with mountainous and other terrain protuberances. WIND TUNNEL MEASUREMENTS OF THREE-DIMENSIONAL WAKES OF BUILDINGS Final Report
Earl Logan, Jr. and Shu Ho Lin Washington NASA Jun. 1982 95 p refs
(Contract NAS8-32357)
(NASA-CR-3565; M-379; NAS 1.26:3565) Avail: NTIS HC A05/MF A01 CSCL 04B

Measurements relevant to the effect of buildings on the low level atmospheric boundary layer are presented. A wind tunnel experiment was undertaken to determine the nature of the flow downstream from a gap between two transversely aligned, equal sized models of rectangular cross section. These building models were immersed in an equilibrium turbulent boundary layer which was developed on a smooth floor in a zero longitudinal pressure gradient. Measurements with an inclined (45 degree) hot-wire were made at key positions downstream of models arranged with a large, small, and no gap between them. Hot-wire theory is presented which enables computation of the three mean velocity components, U, V and W, as well as Reynolds stresses. These measurements permit understanding of the character of the wake downstream of laterally spaced buildings. Surface streamline patterns obtained by the oil film method were used to delineate the separation region to the rear of the buildings for a variety of spacings. S.L.

FORECASTING AIRCRAFT CONDENSATION TRAILS
Sep. 1981 25 p refs
(AD-A111876; AD-E850130; AWS/TR-81/001) Avail: NTIS HC A02/MF A01 CSCL 04/2

Aircraft condensation trails (contrails) are caused by aircraft aerodynamics or engine exhaust in the proper atmospheric conditions. Engine-exhaust trails are the most common and are discussed in this report. Jet aircraft contrail-formation graphs facilitate yes-or-no forecasts for any season with forecasts of pressure, temperature, and relative humidity. Contrail probability curves give condensation trail probabilities with forecast pressure and temperature. Engine power setting does not affect contrail formation, but does affect intensity. The contrail-formation graph for propeller aircraft is similar to the jet graph. GRA

CONTROL OPTIMIZATION, STABILIZATION AND COMPUTER ALGORITHMS FOR AIRCRAFT APPLICATIONS Status Report, 15 Apr. 1981 - 15 May 1982
Michael Athans, ed. and Alan S. Willsky, ed. 15 May 1982 40 p refs
(Grant NGL-22-009-124)
(NASA-CR-169015; NAS 1.26:169015; LIDS-SR-1210; SR-28) Avail: NTIS HC A03/MF A01 CSCL 09B

The analysis and design of complex multivariable reliable control systems are considered. High performance and fault tolerant aircraft systems are the objectives. A preliminary feasibility study of the design of a lateral control system for a VTOL aircraft that is to land on a DD963 class destroyer under high sea state conditions is provided. Progress in the following areas is summarized: (1) VTOL control system design studies; (2) robust multivariable control system synthesis; (3) adaptive

and maximizes reliability. The potential benefits of inlet and engine control integration are presently under study. The primary function of the air inlet control system is to position the three variable ramps in each inlet to some preset schedule of angles, so that ramp position is exclusively a function of Mach number. To achieve low total pressure distortion for static operation, total pressure recovery was intentionally lowered to minimize differences between average and minimum pressures. Analtyical estimates of aircraft forebody effects on the inlet flow field, using a three-dimensional inviscid supersonic flow field code, are found to be close to wind tunnel test results. Suggestions are made in light of study determinations for more advanced inlet designs. O.C.

A82-35279 # The performance of centrifugal compressor channel diffusers. C. Rodgers (Solar Turbines, Inc., Turbomach Div., San Diego, CA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-10.* 13 p. 14 refs. Members, $2.00; nonmembers, $4.00.

The most important performance criteria influencing maximum diffusion capability are formulated through the analysis of test results, for single-stage centrifugal compressors having backswept impellers and channel-type diffusers. The diffuser types considered are pipe, splitter, tandem, profiled L/E, channel, and slotted. It is determined that for any given stage, state surge occurred near a constant mean stream velocity diffusion ratio between the impeller tip and diffuser throat. While this diffusion ratio reached a maximum number of 1.8 for impeller tip Mach numbers lower than unity, it was not unique for all stages and was more strongly associated with throat blockage accumulation as a function of diffusion rate. Results of experiments in the vaneless space illustrate the sensitivity of the influence of flow in that region on centrifugal compressor performance. O.C.

A82-35285 # Semi-empirical analysis of liquid fuel distribution downstream of a plain orifice injector under cross-stream air flow. M.-H. Cao (Beijing Institute of Aeronautics and Astronautics, Beijing, People's Republic of China), H.-K. Jiang, and J.-S. Chin. *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-16.* 9 p. Members, $2.00; nonmembers, $4.00.

An improved flat-fan spray model is used for the semi-empirical analysis of liquid fuel distribution downstream of a plain orifice injector under cross-stream air flow. The model assumes that, due to the aerodynamic force of the high-velocity cross air flow, the injected fuel immediately forms a flat-fan liquid sheet perpendicular to the cross flow. Once the droplets have been formed, the trajectories of individual droplets determine fuel distribution downstream. Comparison with test data shows that the proposed model accurately predicts liquid fuel distribution at any point downstream of a plain orifice injector under high-velocity, low-temperature uniform cross-stream air flow over a wide range of conditions. V.L.

A82-35287 # Casing wall boundary-layer development through an isolated compressor rotor. I. H. Hunter (Shell Research, Ltd., Chester, England) and N. A. Cumpsty (Cambridge University, Cambridge, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-18.* 13 p. 20 refs. Members, $2.00; nonmembers, $4.00.

A comprehensive series of measurements were made of the development of the casing wall boundary layer across an isolated compressor rotor having variable tip clearance with a view to revealing details of the flow phenomena. Time-averaged measurements of the outer-wall boundary layer downstream of the rotor were obtained using a conventional pressure probe, while a hot-wire anemometry technique yielded the three-dimensional blade-to-blade structure of the flow. The downstream boundary layer was found to thicken as the rotor blading and blade-end clearance were increased, with fluid tending to accumulate towards the pressure side of the passage. Results of the study should find application in multistage machines where the importance of casing boundary layers is particularly great. V.L.

A82-35288 # Secondary flows and losses in axial flow turbines. D. G. Gregory-Smith (Durham, University, Durham, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-19.* 4 p. 11 refs. Members, $2.00; nonmembers, $4.00.

A simple method is proposed for estimating secondary flow angles and losses in turbines which is suitable to form a subroutine of a larger design method. The secondary flow angles are calculated using classical secondary flow theory, while losses are estimated by identifying three sources of loss, calculating them independently, and adding them together. Initial results show that the method has the potential of yielding reliable estimates, while being much faster and easier to apply than viscous three-dimensional flow calculation methods. V.L.

A82-35289 # CFD technology for propulsion installation design - Forecast for the 80's. G. C. Paynter (Boeing Military Airplane Co., Seattle, WA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-21.* 8 p. 13 refs. Members, $2.00; nonmembers, $4.00.

One of the objectives of the present investigation is to provide an outline of the primary role of Computational Fluid Dynamics (CFD) in the aerospace industry and to clarify why CFD will be of increasing interest to industry in the 1980's. A second objective is to present current trends in CFD along with an explanation of these trends. Finally, key problem areas are defined which will pace the application of CFD technology by industry. In aircraft design procedures, the potential role of CFD is to minimize parametric model scale testing and use parametric analysis as the basis for configuration selection. Use of parametric analysis rather than parametric testing for design offers the advantages of reduced development cost, time, and risk. It also removes as a design contraint the existing test data base. Aspects of flow analysis technology development are discussed, taking into account numerics and mesh generation, turbulence modeling, and modeling and validation experiments. G.R.

A82-35290 # Smoke reduction in FJR-710 turbofan engines by an airblast combustor. K. Eguchi, A. Ishii (National Aerospace Laboratory, Chofu, Tokyo, Japan), K. Suzuki (Ministry of International Trade and Industry, Mechanical Engineering Laboratory, Ibaraki, Japan), K. Kitahara (Kawasaki Heavy Industries Co., Ltd., Hyogo, Japan), and T. Tagashira (Ishikawajima-Harima Heavy Industries Co., Ltd., Jet Engine Div., Tokyo, Japan). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-24.* 11 p. 18 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Ministry of International Trade and Industry of Japan.

An airblast fuel atomizer has been developed to reduce smoke emission levels in turbofan engines of the FJR-710 series. An annular combustor with the newly designed fuel atomizer was rig-tested in the presence of inlet airflow distortions over a wide range of inlet pressures and temperatures with a view to improving the combustor performance and reducing exhaust emissions through cowl and liner modifications. Smoke emission levels were below the visible limits for both main- and main/primary-fuel operations in the engine tests; levels at full-power conditions were found to meet the 1984 EPA standard for T2-class engines. There was no problem with flame instability or combustor durability. V.L.

A82-35292 # Thermal decomposition of aviation fuel. A. E. Peat (Rolls-Royce, Ltd., Derby, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-27.* 4 p. 5 refs. Members, $2.00; nonmembers, $4.00.

Thermal stressing of aviation fuels can promote the formation of fuel insoluble compounds. Their presence within the fuel system is troublesome to aviation gas turbine manufacturers as they can adversely affect engine performance. To study this phenomenon, an experimental program based on a fuel rig capable of reproducing relevant engine conditions and featuring an instrumented replica fuel injector feed arm was devised. The initial objectives are to rate quantitatively the effects of bulk fuel and metal temperatures, fuel flow rates, and fuel types on the production of fuel insoluble matter, both deposited and suspended. This report presents the initial results which indicate a relationship between the weight of 'tube' carbon deposits and a function of 'tube' metal temperature and fuel velocity. Further, this approach could provide an interface between the engine and laboratory test results. (Author)

A82-35293 # Plain-jet airblast atomization of alternative liquid petroleum fuels under high ambient air pressure conditions. A. K. Jasuja (Cranfield Institute of Technology, Cranfield, Beds., England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-32.* 7 p. 5 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Ministry of Defence (Procurement Executive).

The effects that air and fuel properties have upon the spray mean drop size characteristics of a plain-jet airblast atomizer of the type employed in the gas turbine engine are investigated. The tests used kerosene, gas oil and a high-viscosity blend of gas oil in residual fuel oil, and covered a wide range of ambient air pressures. Laser light-scattering technique was employed for drop size measurements. It is concluded that the atomizer's measured mean drop size characteristics are only slightly different from those of the pre-filming type, especially when operating on low-viscosity kerosene under higher ambient air pressure. The beneficial effect of increased levels of ambient air pressure on mean drop size is shown to be much reduced in the case of high-viscosity fuels, thus making the attainment of good atomization performance on such fuels difficult. An expression is derived for correlating the obtained mean drop size data. C.D.

A82-35294 # Fuel microemulsions for jet engine smoke reduction. D. W. Naegeli and C. A. Moses (Southwest Research Institute, San Antonio, TX). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-33.* 10

p. 11 refs. Members, $2.00; nonmembers, $4.00. Contract No. F08635-79-C-0213.

Soot formation in gas turbine engines continues to be a threat to the operation and performance of aircraft. A recent problem is related to the control of smoke emissions from jet engine test cell facilities. A concept of water-in-fuel emulsions for the purpose of reducing smoke emissions from jet engine test cells was developed. However, some basic problems were encountered with water-in-fuel macroemulsions. Recently, methods were developed for creating 'microemulsions' of water-in-fuel and of alcohol-in-fuel. The present investigation has the objective to determine if the microemulsion concept could be used as a viable method to reduce exhaust smoke from gas turbine engines. It was found that if it is possible to formulate microemulsions involving fuel blends of both JP-4 and JP-8 with ethanol (aqueous), methanol, and water. Ethanol (anhydrous) is soluble in JP-4 and JP-8. Effects of these blends on combustion performance are related to the reduction of soot formation, exhaust smoke, and nitrogen oxide concentration. G.R.

A82-35295 # Investigation of blade vibration of radial impellers by means of telemetry and holographic interferometry. U. Haupt and M. Rautenberg (Hannover, Universität, Hanover, West Germany). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-34.* 6 p. Members, $2.00; nonmembers, $4.00. Research supported by the Deutsche Forschungsgemeinschaft and Forschungsvereinigung Verbrennungskraftmaschinen.

Blade vibration measurements are carried out on a high-pressure, high-mass-flow, centrifugal compressor to determine the excitation mechanism in various operating ranges. Semiconductor strain gauges are used in the experiments, and an eight-channel telemetry system serves to transmit the signals. Blade vibration measurements are made for different operating ranges of the compressor, such as rotating stall and surge and flutter, and for the case of nonuniform flow conditions. The results of vibration tests with the impeller at rest show the stress distribution and the strain directions during blade vibration. This information is used for the choice of the strain gauge position on the blade. The experimental results are confirmed by a finite-element calculation considering a segment of the impeller with one blade, which determines the different vibration modes. In addition, the steady strain distribution of the impeller due to centrifugal force and temperature is calculated. The investigations are completed by optical measurements to find out the vibration modes of the different blades in rotating operation. The results reveal the various vibration modes of the blade up to a rotational speed of the compressor of 13,000 rpm. C.R.

A82-35296 # Acoustic control of dilution-air mixing in a gas turbine combustor. P. J. Vermeulen, J. Odgers (Université Laval, Quebec, Canada), and V. Ramesh (Calgary, University, Calgary, Alberta, Canada). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-35.* 12 p. Members, $2.00; nonmembers, $4.00. Natural Sciences and Engineering Research Council of Canada *Grant No. A-7801.*

A successful test carried out on a small combustor of normal design employing acoustic control of the dilution-air flows is described, noting that the combustor, even though tested at 'off-load' conditions, is much more representative of an engine combustor than the one described by Vermeulen and Odgers (1979). It is demonstrated that acoustic modulation of the dilution-air flows can be used to selectively and progressively control the exit plane temperature distribution. In particular, for an already good traverse quality, it is shown to be possible to trim the temperature profile; the results here are seen as sufficiently encouraging to warrant further development of the technique. It is thought that the study will contribute to the design of combustors in which a desired exit plane temperature distribution may be achieved. The acoustic drive is found to have no effect on the combustion efficiency. C.R.

A82-35298 # Experimental investigations on the flow in the impeller of a centrifugal fan. G. Caignaert, B. Desmet, and D. Stevenaert (Ecole Nationale Supérieure d'Arts et Métiers, Lille, France). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-37.* 6 p. 9 refs. Members, $2.00; nonmembers, $4.00.

A centrifugal research fan facility designed for pressure measurements on the impeller blades is described. Results of mean and fluctuating pressures are presented, showing the flow to be three-dimensional and rather unsteady. Also included is an analysis of rotating stall at low flow rates. The variations in the pressure distributions on the blade when the flow is varied reveal the influence of the angle of attack all along the blade leading edge and the importance of a good design of the inlet part of the blade in order to obtain better characteristics. The analysis of pressure fluctuations shows the important interaction with the volute, despite a large gap between the volute tongue and impeller. C.R.

A82-35299 # Small engine inlet air particle separator technology. H. L. Morrow and D. B. Cale (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-40.* 7 p. 18 refs. Members, $2.00; nonmembers, $4.00.

In connection with Army operations involving an employment of the newly developed airmobile concept, it was found that engine erosion problems, related to an ingestion of sand and dust, limited the average operational life of helicopter gas turbine engines to about 300 hours. A number of programs were initiated with the aim to study approaches for solving the corrosion problem. The Army finally elected to solve the problem by having the engine manufacturer develop the inlet protection system as part of the engine. This approach insures adequate development testing of the protection system concurrent with normal engine development and precludes quick-fix, after-the-fact development. It also results in the inclusion of the inlet protection system and its losses in the basic engine weight, volume, and performance. G.R.

A82-35300 # Conversion of centrifugal compressor performance curves considering non-similar flow conditions. W. Fister (Bochum, Ruhr-Universität, Bochum, West Germany) and J. Kotzur (Maschinenfabrik Augsburg-Nürnberg AG, Oberhausen, West Germany). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-42.* 14 p. 22 refs. Members, $2.00; nonmembers, $4.00.

A detailed flow model of a radial compressor stage has been used to develop a new conversion method which makes it possible to consider, with few measurements, the effect of the most important parameters, such as Mach and Reynolds numbers, on energy transfer in the stage and flow losses. The new method is shown to provide a convenient, time-saving and sufficiently accurate way of converting performance characteristics within relatively wide ranges of peripheral Mach numbers and Reynolds numbers. Performance curves converted using the proposed method are presented and compared to measured values. V.L.

A82-35301 # On the influence of the number of stages on the efficiency of axial-flow turbines. G. Lozza, E. Macchi, and A. Perdichizzi (Milano, Politecnico, Milan, Italy). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-43.* 10 p. 12 refs. Members, $2.00; nonmembers, $4.00.

A computer code able to optimize significant design variables of a multi-stage axial-flow turbine is described, and the selection of optimizing design variables, constraint assumptions within which the solution is searched, and the optimization procedure used, are discussed. Losses are predicted by the Craig and Cox (1971) correlation. The design and performance prediction of a number of representative turbines is accomplished by a computer program, and similarity parameters are introduced to generalize the results obtained after a discussion of their physical significance for a multistage turbine's compressible flow. Turbine stage number influence on overall turbine efficiency is derived as a function of expansion ratio, specific speed and turbine dimensions. O.C.

A82-35302 # Secondary flow mixing losses in a centrifugal impeller. M. W. Johnson (Liverpool, University, Liverpool, England) and J. Moore (Virginia Polytechnic Institute and State University, Blacksburg, VA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-44.* 9 p. 13 refs. Members, $2.00; nonmembers, $4.00. Research supported by Rolls-Royce, Ltd.

A 'jet-wake' pattern has been observed in studies of outlet flows from centrifugal impellers. However, although impeller geometry, flow rate, and operating speed are known to influence the size and position of the wake, wake flows cannot be predicted reliably by current design methods. An improvement regarding the understanding of the wake flow would, therefore, be helpful in connection with efforts to optimize the performance of centrifugal compressors. In order to predict the development of the wake, it is necessary to investigate in detail the secondary flows which contribute to the thickening of the boundary layers on the suction surface and shroud walls. The present investigation is concerned with the determination of the flow phenomena which influence the development of the wake and its size and location in the impeller discharge flow. It is found that the secondary flows strongly influence the position of the wake in the outlet plane of a centrifugal impeller. G.R.

A82-35303 # The influence of flow rate on the wake in a centrifugal impeller. M. W. Johnson (Liverpool, University, Liverpool, England) and J. Moore (Virginia Polytechnic Institute and State University, Blacksburg, VA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-45.* 8 p. 11 refs. Members, $2.00; nonmembers, $4.00. Research supported by Rolls-Royce, Ltd.

A description is presented of the results of measurements made in a de Havilland Ghost centrifugal impeller running at low speed (500 rpm). All three mutually perpendicular components of relative velocity and the rotary stagnation pressure were measured on five cross-sectional planes between the inlet and the outlet of the impeller for three different flow rates. It was found that significant total pressure losses occur in two regions of the impeller, including the suction-side/-shroud corner region in the inducer at both the 'below design' and 'design' flow expression is derived for the dependence of the icing rate upon the studied parameters and comparison is made with the measured icing rate. For a range of temperatures from -21 to -8 C, the icing rate appears to be reduced by about 50 percent by the presence of large ice particles in concentrations above 5/L. C.D.

A82-36065 Evaluation criteria for aero engine materials (Bewertungskriterien für Werkstoffe des Flugtriebwerkbaues). P. Esslinger (Motoren- und Turbinen-Union München GmbH, Munich, West Germany). *Metall*, vol. 36, June 1982, p. 654-659. In German.

The criteria examined include lightweight construction, technological and economic properties, and reliability. Energy and raw materials consumption is a criterion steadily increasing in importance, especially when critical elements such as cobalt and chromium are involved. Substitutes for scarce materials are indicated. The quantitative prediction of materials failure is analytically discussed, and failure probability curves for a homogeneously stressed, rotating bar are given. Wöhler curves for strain tests on nickel materials are found along with maximum strain amplitudes for nickel materials of various yield points and failure values. C.D.

A82-36175 # An alternate test procedure to qualify future fuels for Navy aircraft. C. A. Moses, N. R. Sefer, and M. L. Valtierra (Southwest Research Institute, San Antonio, TX). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1233.* 9 p. 22 refs. Contract No. N00140-80-C-2269.

The U.S. Navy is experiencing pressures to modify the JP-5 fuel specification because of the growing shortage of high-quality crude oils from which kerosene can be simply distilled, and the increased costs of refining lesser quality crude oils to meet the current specification. A program has been initiated with the objective to study and develop a qualification procedure for future fuels. The purpose of the Alternative Test Procedure (ATP) would be to reduce the number of large-scale engine and flight tests required to develop confidence that a new fuel type will perform satisfactorily. Attention is given to future Navy aircraft fuels, the impact of future fuels on aircraft systems, aspects of hot section durability, materials compatibility, lubricity, cold day ignition, and thermal stability. It is concluded that an ATP to qualify future fuels is both necessary and feasible. G.R.

A82-36191 Digital spectral analysis of the noise from short duration impulsively started jets. I. S. Hodge, D. J. Smith, and N. H. Johannesen (Manchester, Victoria University, Manchester, England). *Journal of Sound and Vibration*, vol. 82, May 22, 1982, p. 171-179.

Techniques in which a shock tube is used to produce short duration jets are discussed briefly. The method adopted involves using the shock tube as a static reservoir with the jet exhausting through a nozzle originally closed by a diaphragm. Short duration noise samples of a Mach 0.9 air jet are recorded digitally and narrow band and one-third octave spectra are evaluated. Average spectra from a number of samples are presented. Comparison with both digital and analog spectra from the equivalent continuous jet demonstrates that it is possible to obtain meaningful spectra by averaging short duration samples of impulsively started jets. The technique is therefore suitable for the relatively cheap exploration of the noise field of jets of a wide variety of gases. (Author)

A82-36281 * # A single-frequency multitransmitter telemetry technique. V. A. Carreno (NASA, Langley Research Center, Flight Control Systems Div., Hampton, VA). *Instrument Society of America, International Instrumentation Symposium, 28th, Las Vegas, NV, May 3-6, 1982, Paper.* 9 p.

A telemetry technique for a special data collection system being developed for use on general aviation aircraft involved in aeronautical research programs is described. The system consists of a number of sensor-transmitter units at different locations on the aircraft, with individual signal conditioning and logic, which send sampled data signals to a single receiver in the airplane. The transmitters operate independently on the same frequency and are not synchronized to the receiver. The problem of reception of multiple samples simultaneously is treated by discarding such samples. An overlap detection technique for the frequency shift keyed modulation system is described. The amount of predicted data loss due to overlap is presented and compared with results obtained with a circuit implementation; the effects of discarded data on accuracy is discussed. (Author)

A82-36673 † Evaluating the effectiveness of hydrorefining of the low-stability component of T-1 fuel (Otsenka effektivnosti gidroochistki malostabil'nogo komponenta topliva T-1). A. A. Aliev, Kh. A. Akhmedov, L. G. Ismailova, and M. A. Mardanov (Akademiia Nauk Azerbaidzhanskoi SSR, Institut Neftekhimicheskikh Protsessov, Baku, Azerbaidzhan SSR). *Khimiia i Tekhnologiia Topliv i Masel*, no. 6, 1982, p. 27, 28. In Russian.

An experimental study has been carried out to investigate the possibility of improving the thermal stability of T-1 jet fuel by hydrorefining the component responsible for the low stability of T-1. The physicochemical properties of T-1 are presented along with the results of thermal stability tests before and after hydrorefining, showing that the thermal stability of the fuel increases by 3.8 times following hydrorefining. V.L.

A82-36937 The computerized cockpit for the one-man crew. M. Lambert. *Interavia*, vol. 37, June 1982, p. 608, 609.

The Demonstration Advanced Avionics System (DAAS), a NASA experiment, is an integrated computer system designed to produce information, guidance and control for the pilots of light aircraft, similar to that already in use in fighters and airliners. The DAAS system uses integrated displays from a central computer to provide data about navigation, flight status, aircraft configuration items and other similar matters to general aviation pilots. An improved version of the DAAS system offering greater reliability, smoother integration of analog sensors and with weather radar incorporated might become commercially available by the mid-1980s. A detailed block diagram of the system in included. N.B.

A82-36947 † The powerplants of the Yak-40 and M-15 aircraft (Silovaia ustanovka samoletov Iak-40 i M-15). V. K. Frantsev and N. A. Sherlygin. Moscow, Izdatel'stvo Transport, 1981. 232 p. 17 refs. In Russian.

The work examines the design, parameters, and operation of the powerplants of the Yak-40 and M-15 aircraft. Attention is given to the effect of changes in the modes and conditions of operation on the loading and mechanical stability of the engine parts. The physical principles underlying engine processes are described theoretically, and particular emphasis is placed on the operation of the engine, its systems and components. B.J.

A82-36950 † Assembly of aircraft instruments (Sborka aviatsionnykh priborov). A. V. Seleznev and V. A. Volokhov. Moscow, Izdatel'stvo Mashinostroenie, 1981. 312 p. 10 refs. In Russian.

The fundamentals of aircraft instrument manufacture are reviewed with reference to the design and performance characteristics of various instruments and basic fabrication processes. In particular, consideration is given to mechanical assembly, electrical assembly, testing, adjustment, and calibration of instruments. Instruments discussed include mechanical instruments with elastic sensing elements (e.g., pressure gages), electromechanical instruments, and gyroscopic instruments. The discussion also covers instrument reliability, process mechanization and automation, quality assurance, and, finally, worker safety and fire prevention. V.L.

A82-36969 * Justification for, and design of, an economical programmable multiple flight simulator. J. G. Kreifeldt (Tufts University, Medford, MA), J. Wittenber, and G. Macdonald. In: Manned systems design: Methods, equipment, and applications; Proceedings of the Conference, Freiburg im Breisgau, West Germany, September 22-25, 1980. New York, Plenum Press, 1981, p. 427-448. 9 refs. Grant No. NsG-2156.

The considered research interests in air traffic control (ATC) studies revolve about the concept of distributed ATC management based on the assumption that the pilot has a cockpit display of traffic and navigation information (CDTI) via CRT graphics. The basic premise is that a CDTI equipped pilot can, in coordination with a controller, manage a part of his local traffic situation thereby improving important aspects of ATC performance. A modularly designed programmable flight simulator system is prototyped as a means of providing an economical facility of up to eight simulators to interface with a mainframe/graphics system for ATC experimentation, particularly CDTI-distributed management in which pilot-pilot interaction can have a determining effect on system performance. Need for a multiman simulator facility is predicted on results from an earlier three simulator facility. G.R.

A82-36972 † Aviation meteorology (Aviatsionnaia meteorologia). A. M. Baranov and S. V. Solonin. Leningrad, Gidrometeoizdat, 1981. 384 p. 132 refs. In Russian.

The effect of meteorological conditions on airplanes and helicopters is considered. In the light of new aviation standards, the principles governing the use of meteorological data in aviation in order to improve the performance and safety of aircraft are set forth. Also considered are questions pertaining to the use of new equipment, including computers, for the collection, processing, and display of the meteorological information intended for aviation. C.R.

A82-36999 # Analysis of rotating structures using image derotation with multiple pulsed lasers and moiré techniques. J. C. MacBain, W. A. Stange (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH), and K. G. Harding (Dayton, University, Dayton, OH). In: Society for Experimental Stress Analysis, Spring Meeting, Dearborn, MI, May 31-June 4, 1981, Proceedings. Brookfield Center, CT, Society for Experimental Stress Analysis, 1982, p. 227-232. 10 refs.

Experiments were carried out on a bladed disk to study dual resonant modes under rotating conditions using image derotated holography and a Q-switched double-pulsed ruby laser. It is shown that hologram interferometry using image derotation is a valuable tool in studying the structural response of rotating bladed disks. It is also shown that the versatility and usefulness of the method can be extended even further by the use of triple-pulsed laser holography and some form of moiré analysis. V.L.

A82-37031 **The PATRIOT Radar in tactical air defense.** D. R. Carey (Raytheon Co., Bedford, MA) and W. Evans. In: EASCON '81; Electronics and Aerospace Systems Conventions, Washington, DC, November 16-19, 1981, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 64-70.

The PATRIOT Radar is a C-band, phased array, multifunction radar that under the control of the Weapon Control Computer in the Engagement Control Station performs target search and track, missile search, track, and communications during midcourse guidance, and target-via-missile (TVM) terminal guidance. This paper describes the functions the radar performs and provides brief descriptions of the subsystems. The use of a multichannel, multifunction receiver and digital signal processor is emphasized to demonstrate the control and processing for multiple radar actions required to support the tactical air defense mission. A summary of results of an extensive test program at the White Sands Missile Range is presented. (Author)

A82-37034 **Simplified digital design tools.** S. M. Seltzer (Control Dynamics Co., Huntsville, AL). In: EASCON '81; Electronics and Aerospace Systems Conventions, Washington, DC, November 16-19, 1981, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 145-150. 8 refs.

This paper presents a design philosophy for developing a digital control (or, guidance and control) system. The philosophy takes advantage of high-fidelity, high-order digital simulation tools coupled with low order analysis techniques that permit mathematical tractability. After describing that philosophy, the major portion of the paper is devoted to a description of three analytical digital design tools and how they can be used in concert. These tools are: (1) the Systematic Analytical Method (SAM) which is a method for obtaining mathematical relationships between desired system inputs and system outputs; (2) the Cross-Multiplication Method which provides a means of obtaining the time-domain response from the system closed-loop transfer function; and (3) the Digital Parameter Space Method which permits one to examine and specify the dynamics of a system. The use of these tools together is demonstrated in a simple example. (Author)

A82-37035 **C band spectral tracking for FM/CW altimetry.** T. O. Perkins, III (Kollsman Instrument Co., Merrimack, NH). In: EASCON '81; Electronics and Aerospace Systems Conventions, Washington, DC, November 16-19, 1981, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 166, 167.

It is shown that the spectrum leading edge detection concept offers a highly accurate and reliable radar altimeter design with low transmit power and narrow receiver bandwidth. By avoiding frequency counters and short time measurements, many of the problems of more classical approaches can be eliminated. It is noted that the approach is also suitable for other applications where accurate distance measurement is required. Aside from the narrow bandwidth, the tracking discriminator response is balanced to cancel noise effects. Since propagation losses are 6 dB/octave for the entire altitude range, it is feasible to measure altitudes to 100,000 feet. C.R.

A82-37037 **An accurate Doppler navigator with microwave simplicity.** S. Monfort and G. Schaffner (Teledyne, Inc., San Diego, CA). In: EASCON '81; Electronics and Aerospace Systems Conventions, Washington, DC, November 16-19, 1981, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 174-178.

This paper describes the extremely simple microwave circuitry of one of the most accurate Doppler navigation radars in use today. The radar consists of four microwave assemblies, a single diode solid state transmitter, a beam switch with one integrated circuit module, a fixed antenna assembly and a two-channel receiver in a single stripline board. (Author)

A82-37039 # **FAA tests on the Navstar GPS Z-set.** R. J. Esposito and E. M. Sawtelle (FAA, Technical Center, Atlantic City, NJ). In: EASCON '81; Electronics and Aerospace Systems Conventions, Washington, DC, November 16-19, 1981, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 208-216. 6 refs.

The FAA independently determined the applicability of Navstar GPS for civil aviation through the flight and laboratory test of a Z-set receiver after this unit was acceptance tested aboard a USAF System Command C-141 aircraft. The acceptance flight tests were performed over the Yuma Proving Ground instrumented range. The FAA conducted initial tests in a twin turboprop engine Grumman Gulfstream from the Technical Center. The Z-set operated in a stand-alone (non-instrumented) configuration. Testing included satellite shielding studies, non-precision approaches to different airports, and operations in high noise/RFI environments (in the vicinity of airports, urban areas, radio and TV antenna towers, etc.). This paper summarizes the acceptance and the FAA familiarization test results. The paper also contains a brief description of completed and future tests for the instrumented Z-set with automated data acquisition systems. (Author)

A82-37040 **Navstar - Global Positioning System: A revolutionary capability.** W. C. Euler and J. W. Breedlove (Magnavox Advanced Products Co., Torrance, CA). In: EASCON '81; Electronics and Aerospace Systems Conventions, Washington, DC, November 16-19, 1981, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 217-224.

A GPS user can obtain an accurate navigation fix at any time in any weather condition and in the presence of interference. Analyses sponsored by the DOD indicate that much of the initial cost of GPS (approximately five billion dollars) can be offset by discontinuing some present-day navigational systems. On the other hand, force enhancement considerations and other cost benefits could reach 50 billion dollars. This paper examines various aspects of GPS, including: global navigation accuracy; support for CCCI, military capability, survivability, cost effectiveness in regard to Nudet detection, tactical-warfare applications, and force enhancement. B.J.

A82-37061 # **Use of CGHRP in transport.** D. Short and J. Summerscales (Plymouth Polytechnic, Plymouth, Devon, England). In: Reinforced Plastics/Composites Institute, Annual Conference, 36th, Washington, DC, February 16-20, 1981, Preprints. New York, Society of the Plastics Industry, Inc., 1981 (Session 11-D). 4 p. 80 refs.

The applications of carbon fiber and glass fiber hybrid reinforced plastics in transport are reviewed with emphasis on benefits achieved by the reduction of weight or the improvement in performance relative to conventional structures. The applications discussed include car bodies, automotive driveshafts, automotive engine parts, yacht hulls, hovercraft blades, airframe structures, and helicopter rotors. Current trends in the field of hybrid plastics are the use of materials with intimately mixed finely dispersed fibers and wider use of thermoplastic matrices instead of the thermosets. V.L.

A82-37062 * # **Composite containment systems for jet engines.** G. T. Smith (NASA, Lewis Research Center, Cleveland, OH). In: Reinforced Plastics/-Composites Institute, Annual Conference, 36th, Washington, DC, February 16-20, 1981, Preprints. New York, Society of the Plastics Industry, Inc., 1981 (Session 12-A). 8 p.
(Previously announced in STAR as N81-17480)

A82-37065 # **A significant role for composites in energy-efficient aircraft.** G. A. Alther (Composite Aircraft Corp., Midland, TX). In: Reinforced Plastics/Composites Institute, Annual Conference, 36th, Washington, DC, February 16-20, 1981, Preprints. New York, Society of the Plastics Industry, Inc., 1981 (Session 12-D). 4 p. 7 refs.

The structural advantages and a 10-year in-service history of the Windecker Eagle all fiberglass/epoxy airframes are discussed. In these airframes, the skins are composed of one or more plies of nonwoven unidirectional fiber cloth, the wing spars and other laminates are also composed of multiple oriented plies of fiber cloth, and a ply of nonwoven 0/90 cloth is used for the outermost plies of the laminates and skins to enhance the finish. Stiffening for the skin laminates is provided by composite laminate stringers varying in thickness from 1/4 to 1 inch spaced with polyurethane foam. The fuselage is molded in one-piece halves complete with vertical tail, wing root, and stabilizer junctures, and bonded together at mating flanges along the top and bottom body lines. It is shown that apart from aerodynamics and energy efficiency, the all fiberglass/epoxy airframe provides greater strength, toughness, and redundancy compared to aluminum for equivalent structural weight. V.L.

A82-37071 # **Fabrication and test of integrally stiffened graphite/epoxy components.** L. M. Poveromo and J. A. Suarez (Grumman Aerospace Corp., Bethpage, NY). In: Reinforced Plastics/Composites Institute, Annual Conference, 36th, Washington, DC, February 16-20, 1981, Preprints. New York, Society of the Plastics Industry, Inc., 1981 (Session 17-A). 8 p. Contract No. F33615-78-C-5234.

A program has been initiated to demonstrate and validate low-cost skin stabilization manufacturing methods for composite designs which are cost-competitive with conventional full-depth aluminum honeycomb structures. The demonstration component selected is the trailing edge of the EF-111A horizontal stabilizer, for which cost data and maintenance experience are available. A production-suitable, vacuum-bag-cure manufacturing method developed for this integrally stiffened graphite/epoxy component is described, and static test results are presented for a full-size trailing edge. The life-cycle cost benefits derived from the use of the proposed manufacturing techniques are discussed. V.L.

A82-37074 # **Application and testing of metallic coatings on graphite/epoxy composites.** C. J. Staebler, Jr., G. Lubin (Grumman Aerospace Corp., Bethpage, NY), and M. Stander (U.S. Naval Air Systems Command,

CASCADE OF CORE TURBINE VANES AND COMPARISON WITH THEORY
Louis J Goldman and Richard G Seashultz Jun 1982 47 p refs
(NASA-TP-2018. E-876. NAS 1.60.2018) Avail NTIS HC A03/MF A01 CSCL 01A

Laser measurements were made in an annular cascade of stator vanes operating at an exit critical velocity ratio of 0.78. Velocity and flow angles in the blade to blade plane were obtained at every 10 percent of axial chord within the passage and at 1/2 axial chord downstream of the vanes for radial positions near the hub, mean and tip. Results are presented in both plot and tabulated form and are compared with calculations from an inviscid, quasi three dimensional computer program. The experimental measurements generally agreed well with these theoretical calculations, an indication of the usefulness of this analytic approach Author

N82-26235*# National Aeronautics and Space Administration Langley Research Center, Hampton, Va
STATIC INTERNAL PERFORMANCE CHARACTERISTICS OF TWO THRUST REVERSER CONCEPTS FOR AXISYMMETRIC NOZZLES
Laurence D Leavitt and Richard J Re Jun 1982 24 p refs
(NASA-TP-2025. NAS 1.60:2025) Avail: NTIS HC A02/MF A01 CSCL 01A

The static performance of two axisymmetric nozzle thrust reverser concepts was investigated. A rotating vane thrust reverser represented a concept in which reversing is accomplished upstream of the nozzle throat, and a three door reverser concept provided reversing downstream of the nozzle throat. Nozzle pressure ratio was varied from 2.0 to approximately 6.0. The results of this investigation indicate that both the rotating vane and three door reverser concepts were effective static thrust spoilers with the landing approach nozzle geometry and were capable of providing at least a 50 percent reversal of static thrust when fully deployed with the ground roll nozzle geometry Author

FLOWS OVER WINGS WITH LEADING-EDGE VORTEX SEPARATION
B M Rao and B Maskew Apr 1982 44 p refs
(Contract NAS1-16155)
(NASA-CR-165858. NAS 1.26:16585. Rept-8105) Avail: NTIS HC A03/MF A01 CSCL 01A

The unsteady cross flow analogy reduces the steady three dimensional separation flow problem into an unsteady two dimensional flow problem in which the section shape changes with time. The two dimensional VORSEP code is extended to the case of arbitrary body growth rates in order to generate the initial vortex structures for the three dimensional free vortex sheet (FVS) code. Automatic procedures to reduce the wing geometry definition to a set of cross flow plane sections corresponding to the locations of the time step solutions and to generate the effective source distribution on each cross flow section to represent the section normal growth across the following steps are incorporated in the VORSEP code. Also, the wake shedding model is improved by adopting a redistribution scheme which improves the stability of the free sheet development with time. The improved wake shedding model combined with the redistribution scheme alleviated the numerical instabilities associated with the vortex rollup S.L.

UPDATE OF THE SUMMARY REPORT OF 1977-1978 TASK FORCE ON AIRCREW WORKLOAD Final Report, 1977 - 1979
William J. Cox, Fay Gold, and Richard L. Sulzer Washington FAA Apr. 1981 82 p refs
(AD-A112547; DOT/FAA/RD-81/34; DOT/FAA/ASF-300-81/2) Avail: NTIS HC A05/MF A01 CSCL 01/2

The 1978 summary of accident data from 1967 through 1976 has been extended through 1979. Comparing accident rates of aircraft types approved for operation by two crewmembers vs. accident rates for those approved for operation by three crewmembers, no indication of a safety problem relating to crew size was found. Over this three-year update period, accident rates per million departures were generally superior for the two-crew aircraft, the same result found for the earlier ten-year period. This nominal superiority is not considered a necessary result of flight deck configuration since there are other important differences in the operating environments of the various aircraft. A separate study has been made of the relationship between crew size and regulatory violations. This study, which is appended, produced no evidence that aircraft with crew size of two are being flown with less compliance than aircraft with a crew size of three Author (GRA)

OPPORTUNITIES EXIST TO ACHIEVE GREATER STANDARDIZATION OF AIRCRAFT AND HELICOPTER SEATS
26 Feb. 1982 7 p
(AD-A111718, GAO/MASAD-82-22) Avail: NTIS HC A02/MF A01 CSCL 01/3

We reviewed the efforts of DOD and the services to standardize flight life-support equipment. While formal management structures and informal agreements have resulted in several standardized life-support items, we found a proliferation of tactical aircraft and helicopter seat systems, the most expensive items of life-support equipment. We believe that the past methods of acquiring seats have been costly; that standardization opportunities have not been adequately defined; and that for the most part, standardization efforts undertaken have not been adequately organized, planned, and supported either by DOD or the services. Increased management emphasis by the Under Secretary of Defense (Research and Engineering) and the services could increase standardization of aircraft seats and lower acquisition and support costs. Implementation of the Deputy Secretary of Defense's April 30, 1981, initiatives, which recognized that increased standardization of subsystems and support systems cannot only reduce life-cycle costs but also increase reliability, should result in additional economies Author (GRA)

A LABORATORY EVALUATION OF THE SUITABILITY OF A XENON FLASHTUBE SIGNAL AS AN AID-TO-NAVIGATION M.S. Thesis
Donald Francis Murphy Dec. 1981 109 p refs
(AD-A110729) Avail: NTIS HC A06/MF A01 CSCL 17/7

Single flick xenon flashtubes have periodically been used by the U.S. Coast Guard as visual signals on marine aids-to-navigation. Their deployment has met with mixed responses. The conspicuity of the signal is excellent; it stands out among other visual signals, both flashing and steady lights. However, the flick is apparently too short, approximately 100 micro sec, for the mariner to fixate on it. He, therefore, is unable to make an accurate judgement concerning the distance to the light. This thesis utilized a Howard-Dolman Box to examine the depth perception of subjects under various flashing light conditions. Author (GRA)

GLOBAL POSITIONING SYSTEM (GPS) GEODETIC RECEIVERS
Walter J. Senus 8 Feb. 1982 5 p refs
(AD-A111026) Avail: NTIS HC A02/MF A01 CSCL 17/7

The NAVSTAR Global Positioning System (GPS) when fully developed will provide world-wide, all weather, continuous, highly accurate radio navigation support to the full spectrum of military uses. In addition it has the potential to revolutionize the navigational capability of the civil sector as well. The Defense Mapping Agency, in conjunction with other government agencies in sponsoring the development of GPS user equipment which will benefit greatly the Mapping, Charting, and Geodesy (MC&G) Community. Among these developments are GPS receivers for geodetic survey applications. GPS geodetic receivers are being built around several operating modes, each of which has its advantages. The GPS program as well as the various techniques being pursued are briefly reviewed. Data collected to date is reported which indicated excellent performance both in the point positioning mode and in the distance difference mode of operation. Further the anticipated improvement in measurement accuracy will be provided with a corresponding reduction in time required to occupy a measurement site and therefore offers operational cost reductions. A COMPARISON OF POLE POSITIONS DERIVED FROM GPS SATELLITE AND NAVY NAVIGATION SATELLITE OBSERVATIONS
William H. Wooden, II 6 Jan. 1982 18 p refs Presented at the 3rd Intern. Geodetic Symp. on Satellite Doppler Positioning
(AD-A110765) Avail: NTIS HC A02/MF A01 CSCL 17/7

The observation of the motion of the Earth's spin axis with respect to the crust has been done continuously since the latter part of 1899 by the International Service. With the advent of new technologies, new determinations of polar motion have been possible. Doppler tracking of the Navy Navigation Satellites has provided estimates of the polar motion on a permanent basis since 1969. Currently, these estimates are done at the Defense Mapping Agency and are distributed to several agencies including the Bureau International de l'Heure (BIH), which has the responsibility of centralizing polar motion data. The NAVSTAR Global Positioning System (GPS) is a new navigation satellite system which will eventually replace the existing Navy Navigation Satellite System. As a byproduct of the orbit estimation process for the GPS satellites, values for the position of the pole are determined. In this paper the two different methods for computing the pole's position from satellite observations are described. The most recent results from each method are compared to each other and to the standard BIH values. A RESEARCH PROGRAM TO REDUCE INTERIOR NOISE IN GENERAL AVIATION AIRPLANES. INFLUENCE OF DEPRESSURIZATION AND DAMPING MATERIAL ON THE NOISE REDUCTION CHARACTERISTICS OF FLAT AND CURVED STIFFENED PANELS Progress Report

Ramasamy Navaneethan, Barry Streeter, Steven Koontz, and Jan Roskam Oct 1981 310 p refs
(Contract NCC1-6)
(NASA-CR-169035; NAS 1.26:169035; KU-FRL-417-17) Avail: NTIS HC A14/MF A01 CSCL 20A

Some 20 x 20 aluminum panels were studied in a frequency range from 20 Hz to 5000 Hz. The noise sources used were a swept sine wave generator and a random noise generator. The effect of noise source was found to be negligible. Increasing the pressure differential across the panel gave better noise reduction below the fundamental resonance frequency due to an increase in stiffness. The largest increase occurred in the first 1 psi pressure differential. The curved, stiffened panel exhibited similar behavior, but with a lower increase of low frequency noise reduction. Depressurization on these panels resulted in decreased noise reduction at higher frequencies. The effect of damping tapes on the overall noise reduction values of the test specimens was small away from the resonance frequency. In the mass-law region, a slight and proportional improvement in noise reduction was observed by adding damping material. Adding sound absorbtion material to a panel with damping material beneficially increased noise reduction at high frequencies. A.R.H.

ON THE DESIGN AND TEST OF A LOW NOISE PROPELLER Final Report

George P. Succi Nov. 1981 52 p refs
(Contract NAS1-16521)
(NASA-CR-165938; NAS 1.26:165938; Rept-4764) Avail: NTIS HC A04/MF A01 CSCL 20A

An extensive review of noise and performance of general aviation propellers was performed. Research was done in three areas. The acoustic and aerodynamic theory of general aviation propellers, wind tunnel tests of three one-quarter scale models of general aviation propellers, and flight test of two low noise propellers. The design and testing of the second propeller is reviewed. The general aerodynamic considerations needed to design a new propeller are described. The design point analysis of low noise propellers is reviewed. The predicted and measured noise levels are compared. Author

AIR FORCE ACADEMY AERONAUTICS DIGEST: SPRING/SUMMER 1981 Final Report

A. M. Higgins, ed., F. M. Jonas, ed., E. J. Jumper, ed., J. M. Kempf, ed., and B. Gregory, ed. Dec. 1981 110 p refs
(AD-A112421; USAFA-TR-81-11) Avail: NTIS HC A06/MF A01 CSCL 20/4

This Digest covers unclassified research in aeronautics performed at the United States Air Force Academy during the six months ending 15 July 1981. This report includes technical papers in the specific areas of aerodynamics, propulsion, experimental instrumentation, engineering education and aeronautical history. Topics include: The Mass Flux Surface Boundary Condition for Linarized Potential Flow; A Numerical Investigation of the Effects of Fin Planform Parameters on the Subsonic Cruise Performance of a Supersonic Arrow Wing Configuration; An Improved Method for Calculation of Static Thrust for the USAFA J-85/13 Turbojet Engine; Pressure Measurement Using a High-Speed Data Acquisition and On-Line Calibration System; Cadet Performance during Summer Academics-Repeat versus non-repeat students; Reflections of an English Literature Major on Our Technological Society; and The Evolution and Future of Aeropropulsion Systems. DEPOT SUPPORT OF GAS TURBINE ENGINES Final Report

T. J. OMalley and David V. Glass Oct. 1981 39 p
(Contract MDA903-81-C-0166)
(AD-A107141; LMI-ML103) Avail: NTIS HC A03/MF A01 CSCL 15/5

This report assesses the DoD's capacity and capability to support the depot maintenance requirements of gas turbine engines over the next 5-10 years. Special attention is given to newer nonaeronautical applications (tanks, marine propulsion, and cruise missile). Gas turbine engines used in fixed and rotary wing aircraft will continue to dominate the engine workload; the gas turbines used in cruise missiles, tanks, and ships will comprise less than 10 percent of the total engine workload by 1990. Additional depot maintenance capacity to support gas turbine engines is not required. The depots have adequate capacity today, and since the gas turbine workload is projected to increase by only 6 percent between FY 82 and FY 87, capacity should remain adequate through the 1980s. The Military Departments have the required capabilities to support the new nonaeronautical gas turbine engines entering the DoD inventory. They have repaired similar engines, both in size and technology, for several years. Author (GRA)

A TECHNICAL ASSESSMENT OF AERONAUTICAL ENGINEERING IN ISRAEL

Joseph A. Strada 1 Jul. 1981 8 p refs
(AD-A106980; ONRL-R-5-81) Avail: NTIS HC A02/MF A01 CSCL 01/3

A variety of Israeli academic and industrial institutions are discussed with an eye toward assessing research and development activities in aeronautical engineering disciplines. Each institution is described in brief and some of its current research projects are listed. Research in aerodynamics, guidance and control, propulsion and combustion is discussed and industrial product lines are described where appropriate. Some conclusions are drawn in an effort to assess the country's overall capabilities in aeronautical engineering. Author (GRA)

OPPORTUNITIES TO REDUCE THE COST OF SOME B-52 MODIFICATIONS Report to Secretary of Defense

9 Apr. 1982 7 p
(AD-A113563; GAO/MASAD-82-30) Avail: NTIS HC A02/MF A01 CSCL 05/1

As part of our ongoing review of the overall modernization of the strategic bomber force, we have paid particular attention to the Air Force's plans for modifying the B-52 force. We found that certain costly items may not be needed in view of the missions of the various models of the B-52 force and their expected life in the force. More specifically, the offensive avionics system (OAS) modification could be scaled back on 67 B-52Gs by deleting unneeded components for a potential savings of $21.6 million; using certain components acquired for B-52Ds on other B-52 aircraft could further reduce OAS funding needs by $33.3 million; and a $35 million modification to comply with SALT II may not be needed on B-52Hs that have been modified to carry cruise missiles. PREPLANNED PRODUCT IMPROVEMENT AND OTHER MODIFICATION STRATEGIES: LESSONS FROM PAST AIRCRAFT MODIFICATION PROGRAMS Interim Report

Frederick Biery and Mark Lorell Dec. 1981 78 p refs
(Contract F49620-82-C-0018)
(AD-A113599; RAND/N-1794-AF) Avail: NTIS HC A05/MF A01 CSCL 15/5

Pre-Planned Product Improvement (P31) is a weapon system acquisition strategy formulated in the late 1970s in a response to the high development costs of new systems, lengthening acquisition intervals, increasing age of current inventories, constrained budgets, and various technology trends. It is founded on the assumption that quality enhancement modification of existing inventory systems is a cheaper and quicker way to modernize than the development of entirely new systems. The P31 strategy is aimed at facilitating this process; its central element is the design of new systems from their origins to accommodate future quality upgrades. Discussion of the merits and disadvantages of P3I, however, remains abstract and theoretical. This Note reviews the circumstances that led to the formulation of P3I, clarifies the implications of the concept and offers an initial assessment of the policy as applied to aircraft systems based on a careful and extensive examination of past major aircraft modification efforts. The authors conclude that long-range pre-planning during the design stage is impractical. This note also provides lessons drawn from past experience on the conduct of modification programs in general. Author (GRA)

SPECIFICATION AND ESTIMATION OF DYNAMIC COST FUNCTIONS FOR AIRFRAME PRODUCTION AIRFRAMES

Thomas R. Gulledge, Jr. Dec. 1981 185 p refs
(Contracts N00014-75-C-0451; F33615-81-K-5116; NR Proj. 365-049)
(AD-A113147; N135) Avail: NTIS HC A09/MF A01 CSCL 14/1

The cost behavior of the airframe industry is unique. Cost minimization models are specified that have potential for modeling this unique production situation. These models are firmly grounded in economic theory, and they stress the importance of learning and production rate as determinants of program costs. As an empirical application, one of the models is applied to the F102 airframe program. Author (GRA)

CHARACTERISTICS OF FUTURE AIRCRAFT IMPACTING AIRCRAFT AND AIRPORT COMPATIBILITY

D. William Conner May 1982 28 p refs
(NASA-TM-84476; NAS 1.15:84476) Avail: NTIS HC A03/MF A01 CSCL 01C

Results are reported of an opinion survey of selected individuals at the decision-making level within the five major manufacturers of transport aircraft in the United States and Europe. Opinions were obtained concerning both possible and probable existence of over 50 compatibility-related characteristics of transport aircraft in use in the years 1990, 2000, and 2010. The maximum size of aircraft is expected to increase, at a roughly uniform rate, to the year 2010 by 85 percent in passengers, 55 percent in airfreighter payload, and 35 percent in gross weight weight. Companion to the expected growth in payloads and gross weight was the identification of probable increases in aircraft geometrical dimensions and component capability, and use of fully double-decked passenger compartments. Wing span will increase considerably more than normally expected to provide wings of higher aspect ratio. New aircraft features coming into probable use include large turboprops, synthetic jet-A fuel, winglets, wake-vortex-reducing devices and laminar flow control. New operational concepts considered probable include steep approaches, high-speed turnoffs, and taxiway towing for the aircraft, plus passenger bypass of the terminal building, expedited handling of belly cargo and an intermodal cargo container for the payloads. AERODYNAMIC INVESTIGATIONS TO DETERMINE POSSIBLE ICE FLIGHT PATHS

W. Burgsmueller, H. Frenz, P. May, and G. Anders Mar. 1982 77 p Transl. into ENGLISH of Vereinigte Flugtechnische Werke--Fokker GMBH Rept-Ef-586, 18 Jan. 1977 84 p Transl. by Kanner (Leo) Associates, Redwood City, Calif.
(Contract NASw-3541)
(NASA-TM-76648; NAS 1.15:76648) Avail: NTIS HC A05/MF A01 CSCL 01C

After flights with the VFW 614 under severe icing conditions, damage to the engine was found. In wind tunnel tests a determination of the origin of this ice was made; it is supposed that the damage was caused by this ice. On the modified flight test model of the VFW 614 on a 1:15 scale, measurements were conducted in the VFW-Fokker wind tunnel with exposed particles which represented the free ice. The results of this testing are presented. Author

AIRCRAFT ALERTING SYSTEMS STANDARDIZATION STUDY. VOLUME 1: CANDIDATE SYSTEM VALIDATION AND TIME-CRITICAL DISPLAY EVALUATION Final Report, Feb. - Nov. 1980

G. P. Boucek, D. A. Po-Chedley, B. L. Berson, D. C. Hanson, M. F. Leffler, and R. W. White Jan. 1981 116 p refs
(Contract DOT-FA79WA-4268)
(AD-A107225; FAA/RD-81/38/1) Avail: NTIS HC A06/MF A01 CSCL 01/2

This report is one of a series of documented studies directed to the improvement and standardization of aircraft alerting systems. The purpose of the study was to develop and validate, through simulation, functional design criteria that can be used in designing effective aircraft alerting systems. The major objectives of this phase study were to: resolve system component questions; validate the two candidate system concepts by comparison to a representative baseline system, for both the pilot and flight engineer stations; evaluate presentation media and display formats for time-critical warnings; develop guidelines for the design of alerting systems. The system component questions were resolved in a series of experiments and the results were integrated into two system concepts for validation. In the validation tests, line-qualified pilots exercised the three alerting systems in a full-mission, fixed-base simulator. In all areas of measurement pilot performance was as good or better with the two candidate system designs than with the conventional, baseline system. The results indicate that a flight engineer station should contain the visual display components offered by the candidate system concepts. Voice was the recommended medium of presentation when rapid response is required. The time-critical display tests showed that fastest pilot response performance was obtained when graphic guidance alerts were placed in the

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering – A Continuing Bibliography* (NASA SP-7037) lists 535 reports, journal articles, and other documents originally announced in September 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

rates, and the final radial section of the impeller at all three flow rates. The losses in the inducer are the result of an adverse pressure gradient in the streamwise direction in the suction-side/shroud corner region, which causes the separation of the boundary layer. The separation point moves downstream as the flow rate is increased, until, at the 'above design' flow rate, separation losses are entirely avoided in the inducer. G.R.

A82-35304 # **Secondary flow effects and mixing of the wake behind a turbine stator.** A. Binder and R. Romey (Deutsche Forschungs- und Versuchsanstalt fur Luft- und Raumfahrt, Institut für Antriebstechnik, Cologne, West Germany). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-46.* 9 p. 16 refs. Members, $2.00; nonmembers, $4.00.

The increase in secondary flow effects of highly loaded turbines with large hub/tip ratios is investigated for the case of a single-stage turbine with cold air flow, whose stator was designed for transonic flow and has a hub/tip ratio of 0.756. After taking measurements without the rotor in several sections behind the turbine stator, with attention to wake mixing and secondary vortices, the magnitude of the mixing losses is derived from the distributions of total pressure loss coefficient and flow direction. The position, intensity structure and development of secondary vortices are also obtained. Complementary five-hole probe measurements confirm the earlier, two-dimensional measurement results. O.C.

A82-35306 # **The low temperature properties of aviation fuels.** G. Brunton, R. R. Willock, and M. A. Voisey (Shell Research, Ltd., Thornton Research Centre, Chester, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-48.* 10 p. 15 refs. Members, $2.00; nonmembers, $4.00.

In connection with easing major constraints regarding the aviation fuel market in connection with increasing fuel demands and decreasing supplies, it is desirable to identify ways of moderating specification requirements which will enhance flexibility, but at the same time maintain product quality. One of the important specification requirements that can constrain fuel availability is the freezing point. A description is presented of research into the low-temperature properties of aviation fuels conducted by a major oil company. Attention is given to the need to define the low-temperature specification requirement, tank studies, the effect of fuel composition on low-temperature properties, current efforts, and the consequences of utilizing a flow-related low-temperature specification requirement. G.R.

A82-35307 * # **Deposit formation in hydrocarbon fuels.** R. Roback, E. J. Szetela, and L. J. Spadaccini (United Technologies Research Center, East Hartford, CT). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-49.* 9 p. 9 refs. Members, $2.00; nonmembers, $4.00. Contract No. NAS3-22277.

The hydrocarbon fuels RP-1, commercial-grade propane, JP-7 and chemically pure propane were subjected to tests in a high pressure fuel coking apparatus in order to evaluate their thermal decomposition limits and carbon deposition rates in heated copper tubes. A fuel thermal stability parametric evaluation was conducted at 136-340 atmospheres, bulk fuel velocities of 6-30 m/sec, and tube wall temperatures of 422-811 K, and the effect of inside wall material on deposit formation was evaluated in tests using nickel-plated tubes. Results show RP-1 deposit formation at wall temperatures between 600 and 800 K, with peak deposit formation near 700 K. Substitution of deoxygenated JP-7 for RP-1 showed no improvement, and the carbon deposition rates for propane fuels were found to be higher than those of either of the kerosene fuels. Nickel plating of the tube walls significantly reduced RP-1 carbon deposition rates. O.C.

A82-35310 # **Development and application of Dabber gas tungsten arc welding for repair of aircraft engine, seal teeth.** J. F. Rudy (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-55.* 4 p. Members, $2.00; nonmembers, $4.00.

It has been recognized that the task of rebuilding worn seal teeth on rotating parts of gas turbine engine hardware is an important part of any program for the reduction of the operating costs of these engines. A procedure for performing the required repair operations for such a task is discussed. Attention is given to the development of a welding technique which places a minimum puddle volume and a small width build-up on top of a continuous narrow edge, to achieve a minimal heat affected zone and minimum shrinkage, in the absence of cold overlaps or other weld defects. A process which worked significantly better than other procedures investigated was to 'dab' the filler wire into the puddle or arc plasma zone. Aircraft gas turbine engine components with seal teeth repaired by the 'Dabber' welding method are now performing satisfactorily in commercial service. G.R.

A82-35311 # **EAGLE - An interactive engine/airframe life cycle cost model.** E. J. Reed, R. R. Horton, and J. B. Fyfe (United Technologies Corp., Government Products Div., West Palm Beach, FL). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-56.* 7 p. Members, $2.00; nonmembers, $4.00. Contracts No. N00019-80-C-0225; No. F33657-77-C-0403; No. F33657-78-C-0256.

The DOD is placing increased emphasis on procedures for predicting and tracking the cost of developing, procuring, and supporting weapon systems over their life cycles. The DOD has also begun to state weapon system requirements in terms of mission to be accomplished rather than specific hardware. The net effect of these and other similar DOD actions has been to require weapon system contractors to expand their system analysis capability to meet DOD requirements. A description has been presented of the Engine/Airframe Generalized Life Cycle Cost Evaluator (EAGLE) model, which has been developed by an American aerospace company primarily to evaluate the influence of engine design decisions on the total weapon system. To accomplish this, an adequate accounting and understanding of engine/airframe interaction, mission impact, engine performance, maintenance, and cost effects was a prerequisite. G.R.

A82-35312 * # **Experimental study of external fuel vaporization.** E. J. Szetela and J. A. TeVelde (United Technologies Research Center, East Hartford, CT). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-59.* 8 p. 9 refs. Members, $2.00; nonmembers, $4.00. Contract No. NAS3-21971.

The fuel properties used in the design of a flash vaporization system for aircraft gas turbine engines were evaluated in experiments using a flowing system to determine critical temperature and pressure, boiling points, dew points, heat transfer coefficients, deposit formation rates, and deposit removal. Three fuels were included in the experiments: Jet-A, an experimental referree broad specification fuel, and a premium No. 2 diesel fuel. Engine conditions representing a NASA Energy Efficient Engine at sea-level take-off, cruise, and idle were simulated in the vaporization system and it was found that single phase flow was maintained in the heat exchanger and downstream of the throttle. Deposits encountered in the heat exchanger represented a thermal resistance as high as 1300 sq M K/watt and a deposit formation rate over 1000 gC/sq cm hr. C.D.

A82-35314 # **Atomization quality of twin fluid atomizers for gas turbines.** M. M. Elkotb, M. A. E. Mahdy (Cairo University, Cairo, Egypt), and M. E. Montaser (Egyptian Army, Egypt). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-61.* 10 p. 17 refs. Members, $2.00; nonmembers, $4.00.

The flow and atomization performance characteristics of external mixing twin fluid atomizers, which were tested over a wide range of geometries and operating conditions, are discussed. Attention is given to such factors as nozzle/needle diameter ratio, normal fuel area, cone angle, and droplet size distribution. It is found that the flow rate increases with nozzle/needle diameter ratio and fuel nozzle area, as well as with an increase of fuel pressure and decrease of air pressure. A dimensional relation is derived which accurately predicts flow number. Functions are also derived for droplet size distribution and Sauter mean diameter, which can together with that for flow number be used in the prediction of fuel concentration and heat release. O.C.

A82-35315 # **The effect of coolant flow on the efficiency of a transonic HP turbine profile suitable for a small engine.** G. W. Michel (Rolls-Royce, Ltd., Aero Div., Bristol, England) and F. H. Kost (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für experimentelle Strömungsmechanik, Göttingen, West Germany). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-63*10 p. 10 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Ministry of Defence (Procurement Executive).

In connection with plans for improving gas turbine efficiency by raising the operational temperature, an investigation has been conducted concerning the design of a suitable engine cooling procedure. The investigation involved a study of the aerodynamic penalties of coolant flow for various configurations of coolant flow. Tests were carried out to investigate the effect of coolant ejection through slots in the trailing edge of a turbine profile suitable for a small engine. In the considered case, the trailing edge thickness has to be large to accommodate the slot and a wall thickness which is mechanically strong enough on either side of the slot. It was found that the vortex shedding from the airfoil trailing edge has a very great effect on the airfoil efficiency at subsonic speeds, at least for airfoils with a thick trailing edge. The efficiency can be improved by the using of a trailing edge slot of certain characteristics. G.R.

A82-35316 # **The use of performance-monitoring to prevent compressor and turbine blade failures.** R. E. Dundas (Factory Mutual Research Corp., Norwood, MA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-66.* 14 p. Members, $2.00; nonmembers, $4.00.

It is noted that in nearly all cases the cause of complete failure in turbine blades is high-frequency fatigue. The three types of vibration that give rise to alternating loading, namely free vibration, forced vibration, and self-excited vibration (flutter), are discussed. It is recommended that manufacturers design blades in such a way that no critical resonances exist within the operating speed range. It is pointed out that no practical method exists for detecting vibration in a blade. The only way to avoid resonant vibration failures is to avoid conditions that produce abnormal circumferential flow distortion. A regular program of frequent performance analysis of compressors and gas turbines can serve to detect developing flow distortion. Uneven combustion can be detected from temperature differences between exhaust-area thermocouples. It is stressed that the occurrence of fatigue signifies a change in the system that should be corrected. C.R.

A82-35318 # **Improved vane-island diffusers at high swirl.** T. Jiang and T.-T. Yang (Clemson University, Clemson, SC). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-68.* 9 p. 7 refs. Members, $2.00; nonmembers, $4.00.

An experimental study is presented on the performance of vane-island diffusers at high swirl (lambda = 9). Results obtained for four sets of 14 straight vanes are compared with those obtained by Ryan and Yang (1980) for five sets of eight vanes. The 14-vane configuration results in a 40% reduction in pressure loss coefficient below that obtained with the eight-vane configurations, the lowest loss coefficients being obtained where the vane leading edge is at a radius equal to about 1.2 times the diffuser inlet radius. Results are presented in terms of (1) pressure rise versus radial location along the diffuser, (2) diffuser effectiveness versus flow coefficient, and (3) minimum pressure loss coefficient versus flow coefficient. O.C.

A82-35322 # **Test facility and data handling system for the development of axial compressors.** A. C. Reusch and S. Timberley (Ruston Gas Turbines, Ltd., New Products Div., Lincoln, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-73.* 9 p. Members, $2.00; nonmembers, $4.00.

The test installation and the data acquisition system used in the aerothermodynamic development of the axial compressor for a new Ruston 6-MW industrial gas turbine are described. Developments in instrumentation techniques are discussed. Processing of the data is outlined and data are presented for a typical graphical output. The merits of the flexibility achieved, both for the aerothermodynamic test facility and the data acquisition system, are discussed. The potential of the installation for the development of other axial compressors is outlined. (Author)

A82-35323 # **Comprehensive analysis of an axial compressor test with adjustable guide vanes.** C.-L. Chang, C.-H. Kuo, and S.-L. Sha (Marine Boiler and Turbine Research Institute, Harbin, People's Republic of China). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-74.* 7 p. 14 refs. Members, $2.00; nonmembers, $4.00.

Adjustment tests have been successfully conducted on a 12-stage single rotor axial compressor formed by adding two stages to the front of the original 10-stage subsonic compressor. Tests were carried out for five rows of adjustable guide vanes, based on the relationship of setting angle variation to speed. The test results were compared with the case when fixed geometry was used. Under the latter conditions, there existed in the medium speed zone 'dual value characteristics' for which detailed measurements were taken and possible implications discussed. It has been shown that the use of adjustable guide vanes for improving medium and low speed performance is fully justified. C.D.

A82-35327 # **Optimization of compressor vane and bleed settings.** J. E. Garberoglio, J. O. Song, and W. L. Boudreaux (United Technologies Corp., Government Products Div., West Palm Beach, FL). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-81.* 9 p. 16 refs. Members, $2.00; nonmembers, $4.00. Contract No. F33615-79-C-2013.

A comparative evaluation of optimization techniques applied to the optimization of vane and bleed settings in multistage axial compressors is carried out. The main considerations in the evaluation are: the number of test points required to achieve an optimum performance goal, the ability to handle performance and aeromechanical constraints, the sensitivity to measurement errors, and the effect of finite vane travel and bleed flow variations. Descriptions are given of Conmin (a FORTRAN program for constrained minimization) and Copes (a FORTRAN program for engineering synthesis). It is concluded that the Copes/Conmin approximate optimization technique is able to guide the optimization of compressor vane and bleed settings. The approximate optimization approach is shown to work well on problems involving experimental measurements and finite step sizes of the independent variables. C.R.

A82-35329 # **Gas turbine airflow control for optimum heat recovery.** W. I. Rowen and R. L. Van Housen (General Electric Co., Schenectady, NY). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-83.* 9 p. Members, $2.00; nonmembers, $4.00.

Attention is given to the economic gains that can be realized by using the control modes now available to optimize the cycle efficiency at part load operation. Included here are variable inlet guide vane (VIGV) control for single-shaft units, and combined VIGV and variable high pressure set (compressor) speed control for two-shaft units. In addition to the normal control optimization mode for maintaining the maximum exhaust temperature, a new control mode is discussed which permits airflow to be modulated in response to a process signal while at constant part load. This control feature is desirable for gas turbines that supply preheated combustion air to fired process heaters. C.R.

A82-35330 # **Carbon formation by the pyrolysis of gas turbine fuels in preflame regions of gas turbine combustors.** C. D. Hurley (National Gas Turbine Establishment, Farnborough, Hants., England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-84.* 7 p. 8 refs. Members, $2.00; nonmembers, $4.00.

A series of experiments is carried out to investigate the formation of carbon from the pyrolysis of gas-turbine fuels, in both the gas and liquid phases, over the temperature range 573-1300 K. Two fuels are examined, a kerosene and a diesel, spanning the range of current and possible future aviation fuels. It is found that only gas-phase pyrolysis can account for the formation of carbon and that there is no difference in the carbon-forming tendencies of kerosene and diesel. The kinetics of the reaction is determined, making it possible to predict the amount of decomposition of the fuels at temperatures up to those typical of the preflame regions of combustors. C.R.

A82-35331 # **Casing treatments on a supersonic diffuser for high pressure ratio centrifugal compressors.** Y. Ribaud (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) and P. Avram (ONERA, Palaiseau, Essonne, France). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-85.* 9 p. 8 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Direction des Recherches, Etudes et Techniques.

While centrifugal compressors with pressure ratios in the 7-10 range often exhibit slow mass flow margins, such casing treatments as the use of large openings at the diffuser throat which are connected to annular plenums have been found to broaden the reduced mass flow range of the diffuser during supersonic inlet operation. While diffuser flow reduction is associated with a drop in efficiency in the region of reduced mass flow variation, the use of a backswept centrifugal rotor is shown to overcome this efficiency. Attention is given to both the experimental apparatus employed and the mechanical design details of the diffuser equipped with near-throat large apertures. O.C.

A82-35332 # **Liquid particle dynamics and rate of evaporation in the rotating field of centrifugal compressors.** O. Pinkus. *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-86.* 10 p. 5 refs. Members, $2.00; nonmembers, $4.00. Contract No. W-7405-eng-26.

Attention is given to an approach in which for an improvement in performance isothermal conditions in centrifugal compressors are achieved in connection with the injection of a coolant from the rotating blades along the path of compression. By full or partial vaporization, the injected liquid would cool the gas, or superheated vapor, and keep it below adiabatic compression temperatures. The particular attraction of such an injection system in centrifugal compressors is that no special equipment is needed for the delivery and compression of the coolant. A study of the process of liquid injection has to take into account the flow of the liquid, aspects of particle dynamics, the rate of vaporization, and two-phase flow. In a study of the injection system, it is found that a large number of orifices with a small diameter should be used. It is desirable to use for the injection liquids of low viscosity. G.R.

A82-35333 # **Two-phase transpiration cooling.** M. A. El-Masri (MIT, Cambridge, MA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-89.* 10 p. 20 refs. Members, $2.00; nonmembers, $4.00.

The history of cooling technologies for gas turbines is briefly considered. It is pointed out that two-phase transpiration cooling offers significant benefits. A major incentive to study two-phase transpiration cooling is the thermodynamic benefit if fuel could be used as the transpiration coolant. The heat transfer problem in a transpired wall is composed of two matched subproblems, including the internal heat transfer between the coolant and the porous wall and the interaction of the transpired stream with the external boundary layer. An analysis of two-phase transpiration cooling is conducted, taking into account a model physical description, governing equations, regimes and modes of operation, and the two-phase range. On the basis of the analysis, two-phase transpiration is identified

Materials and Processes Branch, Washington, DC). In: Reinforced Plastics/Composites Institute, Annual Conference, 36th, Washington, DC, February 16-20, 1981, Preprints. New York, Society of the Plastics Industry, Inc., 1981 (Session 17-D). 5 p. Contracts No. N00019-77-C-0250; No. N00019-78-C-0602; No. N00019-80-C-0059.

Metallic coating systems for graphite/epoxy aircraft structures have been developed to provide protection against the strength-degrading effects of moisture penetration, electromagnetic interference (EMI), paint strippers, and lightning strikes. The effectiveness of these coatings in providing protection against impact damage and laser impingement is also being determined. Perforated and solid aluminum-foil coatings, applied by either secondary bonding or cocuring, significantly improve the moisture resistance and electromagnetic shielding of graphite/epoxy laminates. Aluminum-foil coatings also provide protection against the other threats investigated. The substrate corrosion compatibility, machinability, and repairability of selected coatings have been determined. Forming and bonding techniques to fabricate and apply metal-foil preforms to graphite/epoxy hardware are being developed. (Author)

A82-37080 # Evaluation of sensitivity of ultrasonic detection of disbonds in graphite/epoxy to metal joints. S. W. Schramm, I. M. Daniel, and W. G. Hamilton (IIT Research Institute, Chicago, IL). In: Reinforced Plastics/Composites Institute, Annual Conference, 36th, Washington, DC, February 16-20, 1981, Preprints. New York, Society of the Plastics Industry, Inc., 1981 (Session 23-D). 6 p. 16 refs.

A study was conducted to evaluate, improve and optimize ultrasonic techniques for the detection of disbonds in composite laminate to metal joints. Four graphite/epoxy laminates joined to metal plates were investigated using matched pairs of compression and shear wave ultrasonic transducers of three frequencies (1, 2.25, and 5 MHz). Pulse-echo and through transmission modes were used and A-scans, C-scans and frequency spectra were analyzed. It was found that the higher frequency (5 MHz) compression wave transducer operated in the through transmission mode gave the best results in most cases. Shear wave transducers were found to be cumbersome to use and unsuitable for the cases studied. (Author)

A82-37097 # Efficient part removal processes. G. Lubin. In: Reinforced Plastics/Composites Institute, Annual Conference, 37th, Washington, DC, January 11-15, 1982, Preprints. New York, Society of the Plastics Industry, Inc., 1982 (Session 15-E). 8 p.

A study is undertaken to determine possibilities for cost reduction in the removal of plastic airframe components from their molds. A method based on the use of a thin Tedlar or Nylon strip is described which has demonstrated significant cost reductions through tool wear and part removal time improvements in bag-molding processes. The thin plastic strips are used to delineate the outside edge contours of the bag-molded part's layup, and prevent the formation of resin edge flash and excess resin flow. Where the contour of the molded part is too complex, use may be made of two or more wedges at the edge of the part after the layup is completed. The thin strip technique has demonstrated a 73% saving in part removal labor time, or about 30 min. O.C.

A82-37123 A method for observing the deterioration of airframe life in operational conditions (Metodika pro sledovani odcerpavani zivotnosti draku letounu v provoznich podminkach). V. Kahanek. *Zpravodaj VZLU*, no. 6, 1981, p. 273-283. 8 refs. In Czech.

The paper considers the use of an onboard recording device (Parez) to monitor reductions in airframe fatigue life; this device continuously records load factor, aircraft weight, and speed. Attention is given to an algorithm for calculating the extremum values of the load factor, a method for determining stress at critical locations by means of a transfer function, and the analysis of the random process representing this stress by the method of complete cycles. The appropriate S-N curve, mean-load corrections, and fatigue-test results can be used in determining a two-parameter stress distribution, the accumulation of fatigue damage, and the expected life of the aircraft. B.J.

A82-37127 A gust damper (Tlumic poryvu). V. Pokorny. *Zpravodaj VZLU*, no. 1, 1982, p. 15-21. In Czech.

The paper examines a gust damper, i.e., an automatic device which diminishes the effect of gusts on the longitudinal motion of the aircraft by deflecting part of the flaps. The possibility of implementing this type of damper by its inclusion into the autopilot system is considered. Calculations performed for a small passenger aircraft, show that the use of this damper enhances the comfort of the crew and passengers, improves the piloting of the aircraft, and reduces stresses in the structure. B.J.

A82-37220 # A spark ignition model for liquid fuel sprays applied to gas turbine engines. J. E. Peters (Illinois, University, Urbana, IL) and A. M. Mellor (Purdue University, West Lafayette, IN). *Journal of Energy*, vol. 6, July-Aug. 1982, p. 272-274. 14 refs. Army-supported research.

The characteristic time model for ignition is used to describe the spark ignition of liquid fuel sprays in gas turbine combustors. The model states that for ignition to occur, the energy of a spark must heat up an initial volume such that the heat release rate within that volume is greater than the loss rate. Heat generation is limited first by a droplet evaporation time and then a kinetic time; heat loss (for gas turbine applications) is due to turbulent diffusion and, hence, is controlled by a mixing time. Data from two can-type combustors and seventeen fuels are correlated by a single ignition limit curve. The key to applying the model to engine data is the estimation of drop sizes and equivalence ratios at the spark gap. (Author)

A82-37377 Electric field detection and ranging of aircraft. H. Trinks and J. L. ter Haseborg (Hamburg, Hochschule der Bundeswehr, Hamburg, West Germany). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 18, May 1982, p. 268-274. 7 refs.

The electric field transported by charged aircraft during free flight can be observed quantitatively in distances of up to some 100 m. A system of three plane sensors arranged in the corners of a triangle on the earth's surface is described, by which the flight path of aircraft is detected in the range of 40 to 500 m with velocities of approximately 50 m/s. The theory and typical experimental results are discussed. (Author)

A82-37378 Medium PRF performance analysis. S. A. Hovanessian (Hughes Aircraft Co., Electro-Optical and Data Systems Group, El Segundo, CA). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 18, May 1982, p. 286-296. 9 refs.

A discussion of various types of x-band airborne radars is presented, together with an account of their development. It is related how, starting with simple, low pulse-repetition frequency (PRF) radars for measuring radar-target range, airborne radar development proceeded with more sophisticated high PRF Doppler radars where radar-target range and range rate were measured simultaneously. The use of Doppler (frequency) in signal processing allowed the separation of moving from nonmoving targets (ground), making possible the detection of moving targets in the presence of ground clutter. It is pointed out that more recent advances in waveform generation and selection have led to the development of medium PRF radars, whereby a greater degree of tactical flexibility in target detection is attained by combining the desirable features of both low and high PRF radars. The systematic evolution of these radars is emphasized, and the necessary theoretical background is given for their performance calculations. C.R.

A82-37380 Instrument failure detection in partially observable systems. J. E. Hertel (NORPAC Engineering, Inc., Seattle, WA) and R. N. Clark (Washington, University, Seattle, WA). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 18, May 1982, p. 310-317. 11 refs.

Instrument failure detection using the dedicated observer scheme (DOS) depends on partial state observability through each instrument which is monitored. For instrument fault detection by the DOS technique, a quantitative measure of partial state observability is established for each instrument and used to determine a necessary condition on the output structure of the system. This measure, called the internal redundancy of the instrument, indicates the complexity of the logic required for failure detection, and it also indicates where some hardware redundancy can be introduced into the system to improve the fault detection capability of the DOS. The principles developed are applied to a simulation of the pitch axis autopilot of the A7 jet aircraft. (Author)

A82-37381 Implementing aircraft identification schemes by public key cryptosystems. B. Arazi and N. Ekstein (Negev, University, Beersheba, Israel). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 18, May 1982, p. 318-322. 11 refs.

The use of public key cryptosystems for identification purposes has already been suggested. The practical aspects of using such systems for aircraft identification are discussed. It is shown that the digital signature property is not mandatory for implementing an identification procedure. It is then shown how public key distribution systems can be used for identification purposes. The technical difficulties in implementing an identification scheme are finally discussed with possible solutions offered. (Author)

A82-37446 * Formal specification and mechanical verification of SIFT - A fault-tolerant flight control system. P. M. Melliar-Smith and R. L. Schwartz (SRI International, Computer Sciences Laboratory, Menlo Park, CA). *IEEE Transactions on Computers*, vol. C-31, July 1982, p. 616-630. 11 refs. Contract No. NAS1-15428.

The paper describes the methodology being employed to demonstrate rigorously that the SIFT (software-implemented fault-tolerant) computer meets its requirements. The methodology uses a hierarchy of design specifications, expressed in the mathematical domain of multisorted first-order predicate calculus. The most abstract of these, from which almost all details of mechanization have been removed, represents the requirements on the system for reliability and intended functionality. Successive specifications in the hierarchy add design and implementation detail until the PASCAL programs implementing the SIFT executive are reached. A formal proof that a SIFT system in a 'safe' state operates correctly despite the presence of arbitrary faults has been completed all the way from the most abstract specifications to the PASCAL program. B.J.

A82-37466 # On the vortex flow over delta and double-delta wings. H. W. M. Hoeijmakers, W. Vaatstra (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands), and N. G. Verhaagen (Delft, Technische Hogeschool, Delft, Netherlands). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0949.* 13 p. 44 refs. Research supported by the Royal Netherlands Air Force.

An experimental and theoretical investigation is described of the flow above, and downstream of, a 76 deg delta wing and two double-delta wings (sweep 76 deg/60 deg and 76 deg/40 deg, respectively, with kink at 50% chord). The flow pattern is visualized by means of a laser light-sheet technique. For the case of the delta wing, experimental results are compared with numerical results of a free vortex sheet method for computing three-dimensional flow about slender wings, a free vortex sheet method for the limiting case of conical flow, and a computational procedure for computing two-dimensional time-dependent vortex wake roll-up. Based on the laser light-sheet investigation, a vortex-sheet model is proposed for the flow about double-delta wings with leading-edge vortex separation on both wing panels. (Author)

A82-37467 * # Approximate boundary condition procedure for the two-dimensional numerical solution of vortex wakes. R. P. Weston and C. H. Liu (NASA, Langley Research Center, Analytical Methods Branch, Hampton, VA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-0951.* 9 p. 19 refs.

Research on efficient computational methods for general vorticity fields has been conducted in connection with a need for basic research on vortex-dominated flows. The present investigation is concerned with the evolution of vortex wakes behind aircraft wings. An efficient procedure is presented for the calculation of the boundary values used in the numerical solution of the unsteady, incompressible, two-dimensional Navier-Stokes equations for an unbounded flow field. The extent of the computational grid can be reduced compared to methods utilizing standard boundary conditions, without loss of accuracy. The efficiencies realized make it feasible to calculate the vortex wake development for realistic wing configurations, including the merging of multiple vortices, for Reynolds numbers of about 10,000 based on wing chord. G.R.

A82-37477 # A grid interfacing zonal algorithm for three-dimensional transonic flows about aircraft configurations. E. H. Atta and J. Vadyak (Lockheed-Georgia Co., Advanced Flight Sciences Dept., Marietta, GA). *American Institute of Aeronautics and Astronautics and American Society of Mechanical Engineers, Joint Thermophysics, Fluids, Plasma and Heat Transfer Conference, 3rd, St. Louis, MO, June 7-11, 1982, AIAA Paper 82-1017.* 9 p. 9 refs.

An efficient grid interfacing zonal algorithm has been developed for computing the transonic flow field about three-dimensional multicomponent configurations. The algorithm uses the full-potential formulation and the fully-implicit approximate factorization scheme (AF2). The flow field solution is computed using a component adaptive grid approach in which separate grids are employed for the individual components in the multicomponent configuration, where each component grid is optimized for a particular geometry. The component grids are allowed to overlap, and flow field information is transmitted from one grid to another through the overlap region. An overlapped-grid scheme is implemented for a wing and a wing/pylon/nacelle configuration. Numerical results show that the present algorithm is stable, accurate, and can be used effectively to compute the flow field about complex configurations. (Author)

A82-37483 Boeing's new transports in a flight-test marathon. P. Condom. *Interavia*, vol. 37, July 1982, p. 695-697.

Flight testing is proceeding on two totally new aircraft, the Boeing 757 and 767, each with two alternative powerplants and FAA certifications for these aircraft are expected to be received in record time during the second half of 1982. New test facilities and more flight-test engineers have been required to keep the assigned deadlines. Radically updated acquisition and processing facilities for flight-test data also have been introduced utilizing an 'on-line' data-acquisition system, the principal components of which include a new data analysis and monitor system, a gross weight/center of gravity computer, a microwave aircraft positioning system, a data processing ground station, a ground data analysis station and a flight test computing system. A schematic diagram showing the positioning of the components of the data-acquisition system is included. N.B.

A82-37521 The DRAPO system - Materials means and logic functions (La CFAO en mécanique le système DRAPO - Moyens matériels et fonctions logicielles). M. Nouve Eglise (Avions Marcel Dassault-Bréguet Aviation, Vaucresson, Hauts-de-Seine, France). *Revue Française de Mécanique*, 2nd Quarter, 1982, p. 37-43. In French.

Components and functioning of DRAPO (Definition and Realisation of Aircraft by use of a Computer) system are described. The system comprises procedures, materials, and logistics, and interconnection of remote terminals with a centralized data base serving all fields of aerospace production. The system is used by aerospace CAD/CAM personnel in the fabrication of parts for industrial production. A description of the computers forming the central processing units and the remote terminals is provided, noting the links established through telephone lines. Interactive graphics consoles permit remote access to cataloged design shapes after entry of an alphanumeric code. Programming logic, internal to the main system offers design with light pens, electrostatic design, and large surface graphics. Logic functions for the entire system are noted, including methods of changing and rotating the objects in two- and three-dimensions. Finally, flow charts of the computer operations are given. M.S.K.

A82-37528 Traffic flow control in the Frankfurt/Main airport area (Verkehrsflussesteuerung im Anflugbereich Frankfurt/Main). R. Onken (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Flugführung, Braunschweig, West Germany). *DFVLR-Nachrichten*, June 1982, p. 23-27. In German.

Traffic records at the Frankfurt/Main airport are analyzed in order to determine traffic flow patterns in both the spatial and the temporal dimensions. The effect of various strategies of coordinating traffic flow are assessed. A new computerized traffic planning system concept is explained and evaluated. C.D.

A82-37676 # Investigation of subsonic nacelle performance improvement concept. D. Dusa, D. J. Lahti (General Electric Co., Cincinnati, OH), and D. Berry (Boeing Commercial Airplane Co., Seattle, WA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1042.* 9 p.

Investigations have been conducted with the objective to identify aircraft and nacelle performance improvement concepts aimed at improving the overall aircraft system installed performance. The present study is specifically concerned with exhaust system design technology and impacts on both internal performance and installed drag. A goal of 1% improvement in specific fuel consumption (SFC) and a reduction of 1% in aircraft drag was established. Attention is given to analytical studies, static performance tests, wind tunnel tests, nacelle calibration/thrust-drag bookkeeping, isolated nacelle testing, and installed nacelle testing. G.R.

A82-37677 * # Transonic wind tunnel test of a supersonic nozzle installation. J. A. Yetter (Boeing Military Airplane Co., Seattle, WA), G. B. Evelyn (Boeing Commercial Airplane Co., Seattle, WA), and C. Mercer (NASA, Langley Research Center, Hampton, VA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1045.* 14 p. 8 refs.

The design of the propulsion system installation affects strongly the total drag and overall performance of an aircraft, and the concept, placement, and integration details of the exhaust nozzle are major considerations in the configuration definition. As part of the NASA Supersonic Cruise Research (SCR) program, a wind tunnel test program has been conducted to investigate exhaust nozzle-airframe interactions at transonic speeds. First phase testing is to establish guidelines for follow-on testing. A summary is provided of the results of first phase testing, taking into account the test approach, the effect of nozzle closure on aircraft aerodynamic characteristics, nozzle installation effects and nacelle interference drag, and an analytical study of the effects of nozzle closure on the aircraft. G.R.

A82-37678 * # Kevlar/PMR-15 polyimide matrix composite for a complex shaped DC-9 drag reduction fairing. R. T. Kawai, R. F. McCarthy, M. S. Willer (Douglas Aircraft Co., Long Beach, CA), and F. J. Hrach (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1047.* 9 p. 6 refs.

The Aircraft Energy Efficiency (ACEE) Program was established by NASA to improve the fuel efficiency of commercial transport aircraft and thereby to reduce the amount of fuel consumed by the air transportation industry. One of the final items developed by the program is an improved fairing which is the aft closure for the thrust reverser actuators on the JT8D nacelles on DC-9 aircraft. The reduced-drag fairing uses, in the interest of weight savings, an advanced composite construction. The composite material contains Kevlar 49 fibers in a PMR-15 matrix. Attention is given to the aerodynamic configuration, the material system, and aspects of fabrication development. G.R.

AN UNBIASED ANALYSIS OF THE DOPPLER COORDINATE SYSTEMS

Muneendra Kumar Feb 1982 25 p refs
(AD-A110510) Avail NTIS HC A02/MF A01 CSCL 08/5

The Doppler system has undergone at least five major revisions, or improvements, in its definition since original inception. Some of the so-called 'minor' modifications of the past have not been well documented and corresponding rigorous updating of the software in many instances is also lacking The actual impact and contribution of each such modification and the absence of proper updating towards inner consistency are not negligible in the present sub-meter era The questions whether (1) the Broadcast Ephemeris (BE) based coordinates are either automatically calculated in the WGS 72 datum or derived with respect to the reference ellipsoid for the WGS 72 datum; (2) the BE system, except for a small bias, is close to the NSWC 9Z-2 system, (3) the BE based coordinates are in the NWL 9D system or 'strictly speaking' in the modified NWL 10D system; (4) the Doppler coordinate system as NWL 9D prior to June 1977 and is NSWC 9Z-2 now, and (5) the coordinate system NWL 9D (and/or NSWC 9Z-2) is geocentric or has a significant Z-axis bias, are still floating around The net result is misunderstanding and misinterpretation for many users The present paper tries to highlight some of the related problems and to answer them as well as possible

THE EFFECT OF IONOSPHERIC VARIABILITY ON THE ACCURACY OF HIGH FREQUENCY POSITION LOCATION Final Report

Melvin G Heaps Aug 1981 46 p refs
(DA Proj 1L1-61102-B-53A)
(AD-A107425 ERADCOM/ASL-TR-0095) Avail NTIS
HC A03/MF A01 CSCL 17/7

The attainable accuracies in high frequency (HF) radio wave position location over ranges of several hundred kilometers are beset with errors of tens of kilometers due to constraints in three major areas ionospheric variability and irregularity; system size limitations for easily fieldable systems, and sufficient data acquisition, processing, and interpretation Of principal concern here is the area of ionospheric variability and irregularity The temporal and spatial coherence of ionospheric structure has been considered with respect to its effect on the accuracy of HF position location The findings show that medium and small-scale ionospheric structures most likely to affect HF position location accuracies have a spatial coherence on the order of 50 km and a temporal coherence on the order of 5 minutes On this basis it is recommended that a multiple ionosonde net be used instead of a single ionosonde, such that an ionospheric sounding point is no more than 50 km from a potential radio wave reflection point, and that soundings be taken on the order of every 5 minutes or less

THE WORLDWIDE NAVIGATIONAL WARNING SERVICE

J E Ayers and John P Lyall 1981 14 p
(AD-A107372) Avail NTIS HC A02/MF A01 CSCL 17/2

In the early 1970's both the International Hydrographic Organization (IHO), an intergovernmental agency dedicated to the improvement of nautical charting, and the Intergovernmental Maritime Consultative Organization (IMCO) a U S agency dedicated to safety of life at sea, became concerned over the lack of a coordinated worldwide radio service to keep deep sea mariners aware of hazards to navigation Through their joint efforts the Worldwide Navigational Warning Service (WWNWS) was established, becoming fully operational on 1 April 1980. The WWNWS covers all international shipping routes through a system of 16 NAVAREA Broadcasts, all of which transmit warnings in English (the primary language of the NAVAREA II broadcast is in French) and some of which transmit warnings also in an additional language. This paper describes the development of the initial WWNWS, the mechanism for service improvement and advances which have been made to date, and improvements foreseen for the future. Specific examples from the broadcast experience of the Coordinator for NAVAREA IV and XII and the Northwest Atlantic and Northeast Pacific NAVAREAs, respectively, are given. Author (GRA)

US-Patent-Class-244-23C; US-Patent-Class-244-34A;
US-Patent-Class-244-93) Avail: US Patent and Trademark Office CSCL 01C

An annular wing particularly suited for use in supporting in flight an aircraft characterized by the absence of directional stabilizing surfaces is described. The wing comprises a rigid annular body of a substantially uniformly symmetrical configuration characterized by an annular positive lifting surface and cord line coincident with the segment of a line radiating along the surface of an inverted truncated cone. A decalage is established for the leading and trailing semicircular portions of the body, relative to instantaneous line of flight, and a dihedral for the laterally opposed semicircular portions of the body, relative to the line of flight. The direction of flight and climb angle or glide slope angle are established by selectively positioning the center of gravity of the wing ahead of the aerodynamic center along the radius coincident with an axis for a selected line of flight.

HINGED STRAKE AIRCRAFT CONTROL SYSTEM Patent Application
Dhanvada M. Rao, inventor (to NASA) (Vigyan Research Associates, Inc.) Filed 11 Jan. 1982 13 p Sponsored by NASA
(NASA-Case-LAR-12860-1; US-Patent-Appl-SN-338387) Avail: NTIS HC A02/MF A01 CSCL 01C

Strakes hinged along the fuselage to avoid violent control degradation in the post-stall flight regime are described. Hinged strakes are deflected from the conventional position coplanar with wings to an anhedral setting to increase controllability at high angles of attack by decreasing projected plan area, and altering vortex flow characteristics. As a result, effective lift on wings can be maintained at higher angles of attack than is possible with conventional strakes. The hinged strakes are retracted flush against the fuselage in high speed cruise flight to avoid drag effects. In an alternate mode of operation, strakes can be asymmetrically deployed to create a rolling that enhances roll control, and a side force that counters aircraft nose-slice and directional divergence. USE OF OPTIMIZATION TO PREDICT THE EFFECT OF SELECTED PARAMETERS ON COMMUTER AIRCRAFT PERFORMANCE Final Report
Valana L. Wells and Richard S. Shevell Jun. 1982 61 p refs
(Grant NAG1-202)
(NASA-CR-169027; NAS 1.26:169027; SUDAAR-534) Avail: NTIS HC A04/MF A01 CSCL 01C

An optimizing computer program determined the turboprop aircraft with lowest direct operating cost for various sets of cruise speed and field length constraints. External variables included wing area, wing aspect ratio and engine sea level static horsepower; tail sizes, climb speed and cruise altitude were varied within the function evaluation program. Direct operating cost was minimized for a 150 n.mi typical mission. Generally, DOC increased with increasing speed and decreasing field length but not by a large amount. Ride roughness, however, increased considerably as speed became higher and field length became shorter. T.M.

ADVANCED CONCEPTS FOR COMPOSITE STRUCTURE JOINTS AND ATTACHMENT FITTINGS. VOLUME 2: DESIGN GUIDE Final Report, Jul. 1977 - Feb. 1981
J. V. Alexander and R. H. Messinger Nov. 1981 274 p refs 2 Vol.
(Contract DAAJ02-77-C-0076; DA Proj. 1L2-62209-SH-76)
(AD-A111106; HH-80-402-Vol-2;
USAAVRADCOM-TR-81-D-21B) Avail: NTIS HC A12/MF A01 CSCL 01/3

The purpose of this program was to develop the technology of applying fiber-reinforced composite materials to helicopter joints and attachment fittings that permit disassembly of major components. A generic design methodology approach was used to make the data developed applicable to ongoing and future helicopter programs. A detail design, analysis, and testing program was carried out on the three joint and fitting concepts selected: wrapped tensions fittings, gear box attachment fittings, and seat attachment fittings. The scope of the study included analytical design tools, including finite element computer analysis; fabrication techniques, with special emphasis on weight and cost effectiveness considerations; structural integrity testing, including static, dynamic, failsafe/safe-life, and ballistic tolerance considerations; and nondestructive inspection (NDI) techniques. This volume contains the analytical and experimental results of the laminated angle bracket study and the Design Guide, which covers each type of joint or fitting tested. Author (GRA)

NAVY'S F/A-18 EXPECTED TO BE AN EFFECTIVE PERFORMER BUT PROBLEMS STILL FACE THE PROGRAM Report to Congress
26 Feb. 1982 39 p refs
(AD-A111877; GAO/MASAD-82-20) Avail: NTIS HC A03/MF A01 CSCL 01/3

The F/A-18 naval strike fighter is a multi-mission, carrier-suitable aircraft. This twin-engine aircraft will be used by the Navy and the Marine Corps for fighter and light attack missions such as strike escort, fleet air defense, interdiction, and close air support. The Navy is concentrating on initial training, logistics and support activities as the F/A-18 development program nears completion. All 9 pilot production aircraft have been delivered to the Navy as well as the first 4 of 25 limited production aircraft. Five aircraft were sent to the initial F/A-18 squadron which will begin training F/A-18 pilots and mechanics beginning in July 1982. The first class will be mostly Marine Corps personnel in preparation for the December 1982 initial operation capability, when the first Marine Corps F/A-18 squadron receives its full complement of aircraft. ADVANCED INTERNAL CARGO SYSTEM CONCEPT DEMONSTRATION AND EVALUATION Final Report, Jan. 1980 - Sep. 1981
C. Ednie Jan. 1982 65 p refs
(Contract DAAK51-80-C-0006; DA Proj. 1L1-62209-AH-76)
(AD-A111990; D210-11848-1; USAAVRADCOM-TR-81-D-37)
Avail: NTIS HC A04/MF A01 CSCL 15/5

This report describes the design and development activity resulting in an 'add-on' cargo handling system for the CH-47 helicopter. Design activity was initiated as a result of cargo handling problems encountered in the European Theater. The Applied Technology Laboratory at Fort Eustis, Virginia, designed and fabricated a mock-up of an internal cargo handling system that demonstrated a practical approach for an add-on system for the CH-47. An evaluation of this mockup, together with the results of an investigative field trip to the European Theater, led to the requirements definition for the cargo handling system. The cargo handling system can be installed in a CH-47 helicopter with no modifications to the primary structure. The system can handle 463L pallets, warehouse pallets and special munitions. The system includes forward and aft barriers to minimize tiedown requirements, ramp extensions to allow easy fork-lift loading and a fuselage levelling system. Functional tests of the system resulted in minor modifications to the original hardware. The modified hardware has been successfully installed and demonstrated in a CH-47C and a CH-47D model helicopter. Author (GRA)

PROCEEDINGS OF THE 1ST ANNUAL WORKSHOP ON AVIATION RELATED ELECTRICITY HAZARDS ASSOCIATED WITH ATMOSPHERIC PHENOMENA AND AIRCRAFT GENERATED INPUTS
Joseph J. Traybar and Nickolus O. Rasch Oct. 1981 38 p Workshop held at Atlantic City, 26-27 Feb. 1980
(FAA Proj. 182-340-100)
(AD-A107326; FAA-CT-81-205) Avail: NTIS
HC A03/MF A01 CSCL 01/3

This workshop was to bring together the various elements of the agency to engage in discussions to identify aviation related electricity hazards associated with both atmospheric phenomena and aircraft generated inputs, and determine a prioritize specific FAA problem area and/or requirements that need to be addressed. This information is vital in the development of the agency's posture and requirements in this important technology area.

AN OXYGEN ENRICHED AIR SYSTEM FOR THE AV-8A HARRIER Final Report
Richard L. Routzahn Oct. 1981 185 p refs
(AD-A112334; NADC-81198-60) Avail: NTIS
HC A09/MF A01 CSCL 06/11

Due to the high support costs, increase in aircraft down time and hazards associated with the utilization of liquid oxygen, development has been progressing with On-Board Oxygen Generation Systems (OBOGS) which have the capability of providing an aviator's breathing gas of sufficient quality and quantity. An Oxygen Enriched Air System (OEAS), employing the molecular sieve concept, has been subjected to environmental test and evaluation by the Naval Air Development Center. The OEAS contains a molecular sieve oxygen concentrator, breathing regulator and performance monitor. The test and evaluation program was conducted to verify that design criteria have been met and to establish system performance in the environments anticipated on the AV-8A Harrier and other tactical aircraft. The system has successfully demonstrated the ability, under certain conditions, to provide a breathing gas composed of 95 percent oxygen and 5 percent argon. It will also provide adequate amounts of breathing gas and sufficient oxygen concentrations for a one or two man open loop breathing schedule. Concentrator anomalies have occurred during the program with control electronics and lubricants within the unit. Redesign of the breathing regulator is necessary to insure compatibility with lox systems and in providing a greater gas quantity during ground idle conditions. Redesign of the performance monitor is necessary to withstand environmental conditions anticipated in service use. Prior to future aircraft incorporation, design studies must pay consideration not only to bleed air pressure availabilities, but also to temperatures which may degrade system performance.

PROPOSED RESEARCH TASKS FOR THE REDUCTION OF HUMAN ERROR IN NAVAL AVIATION MISHAPS Final Report, 1 Jul. 1980 - Sep. 1981
Donald M. Layton Oct. 1981 24 p
(AD-A112339; NPS67-81-018) Avail: NTIS
HC A02/MF A01 CSCL 01/2

Seven possible areas of research are proposed that could lead to the reduction and/or mitigation of the human error involvement in Navy aircraft mishaps. These include tasks for the Naval Aerospace Medical Research Laboratory, other Navy and contracted activities. The following research actions have been recommended: Review of existing mishap reports; Cockpit review/analysis of existing Aircraft; Review and revision of standard anthrometrical data; Critical Incident Technique; Design/T&E cooperation procedures; Basic research into error causes; and Broad research functions.

DEVELOPMENT OF A BACKPACK SURVIVAL KIT FOR EJECTION SEATS
Thomas J. Zenobi and Gary F. Whitman 8 Feb. 1982 15 p
(W0584001)
(AD-A113653; NADC-82024-60) Avail: NTIS
HC A02/MF A01 CSCL 06/7

The Navy is designing a Backpack Survival Kit (BSK) for ejection seats. Expected advantages of the BSK as compared to seat lid kits are less weight and more crewmember mobility during emergency egress from aircraft cockpits. With development of more sophisticated ejection propulsion systems, volume for survival kit stowage under the seat lid may not be available; the BSK offers an alternative stowage location. Design considerations include integration into the ejection seat system, attachment to the crewmember's restraint harness, stowage of survival gear, liferaft deployment, and crewmember mobility.

CABIN SAFETY IN LARGE TRANSPORT AIRCRAFT
9 Sep. 1981 57 p refs
(PB82-129297; NTSB-AAS-81-2) Avail: NTIS
HC A04/MF A01 CSCL 01B

A study by the National Transportation Safety Board showed that in 58.4 percent of the 77 survivable/partially survivable passenger carrying transport aircraft accidents/incidents occurring since 1970, there were failures of cabin furnishings. These failures killed, injured, entrapped or otherwise incapacitated aircraft occupants preventing successful emergency escape in many cases. Failures of cabin furnishings also created obstacles to egress by blocking aisles and exits. Regulations dealing with occupant protection in crashes were last updated 30 years ago. They do not adequately reflect actual crash experience nor do they provide adequate protection to occupants in survivable crashes, especially the more severe crashes, where it is most needed. Recent accident experience supports the need to upgrade the current minimum design standards. Moreover, the technology exists for upgrading existing design and testing methods for cabin furnishings to meet the upgraded regulations.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

as a potentially-powerful cooling scheme for gas turbines. Moderate blade temperatures may be maintained in very high temperature gas streams without separating the boundary layer or incurring large aerodynamic or cooling penalties. G.R.

A82-35335 # The effect of inlet distortion on the performance characteristics of a centrifugal compressor. I. Ariga, S. Masuda (Keio University, Yokohama, Japan), Y. Watanabe (Japan Air Lines, Overhaul Center, Tokyo, Japan), I. Watanabe (Kanto Gakuin University, Yokohama, Japan), and N. Kasai. *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-92.* 9 p. 9 refs. Members, $2.00; nonmembers, $4.00.

The effects of inlet pressure distortion on the performance characteristics and surge margin of a centrifugal compressor have been investigated experimentally using a low-speed compressor test rig with the inlet honeycomb acting as the distortion generator. Results indicate that inlet distortion has a negative effect on the efficiency and surge margin of the compressor, with radial distortion having a much stronger effect than circumferential distortion. Various distortion indices are examined in order to correlate the compressor performance to inlet distortion, and a distortion index related to the shock loss of the inducer is shown to be a suitable parameter for estimating the total pressure ratio in the case of inlet distortions. V.L.

A82-35336 # A two-dimensional boundary-layer program for turbine airfoil heat transfer calculation. R. M. C. So (Arizona State University, Tempe, AZ), I. H. Edelfelt, D. M. Kercher (General Electric Co., Schenectady, NY), and E. Elovic (General Electric Co., Aircraft Engine Group, Cincinnati, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-93.* 8 p. 23 refs. Members, $2.00; nonmembers, $4.00. Contract No. DE-AC01-76-ET-10340.

Modern gas turbines operate at turbine inlet gas temperature levels which are substantially above the structural capability of the high-temperature alloys used in gas turbine components. It is, therefore, necessary to cool these components. The design of suitable cooling procedures is currently a complex, expensive process, involving the adjustment of calculated values by empirical test factors. The development of a heat transfer calculation procedure could, in this connection, lead to faster and much more economical procedures for the design of suitable cooling processes. The two-dimensional boundary-layer program STAN5 reported by Crawford and Kays (1976) is used as a basis for the development of a program which can be used with confidence by heat transfer design engineers to calculate the heat transfer on turbine airfoil surfaces. G.R.

A82-35337 # Development of hybrid gas turbine bucket technology. L. G. Peterson, D. E. Hrencecin, W. F. Schilling, and W. J. Ostergren (General Electric Co., Gas Turbine Div., Schenectady, NY). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-94.* 10 p. Members, $2.00; nonmembers, $4.00. Contract No. DE-AC01-80ET-17005.

A program has been initiated to evaluate the feasibility of producing a composite large-scale industrial gas turbine bucket using different nickel base superalloys in the airfoil and dovetail sections. Preliminary studies involve microstructure and high temperature tensile test evaluation of three directionally solidified alloys and two powder metal alloys. DS nickel base alloys include MAR-M200 plus Hf, René 80H and 441 (modified René 150) while the powder metals are low carbon versions of Astroloy (AP1) and PA-101. Hot isostatic pressing has been used to diffusion bond DS and powder alloys together. Powder densification and bonding take place simultaneously. Three separate solution temperatures have been used to HIP diffusion and bond each DS/powder alloy combination. Subsequent heat-treating to simulate a coating cycle and aging are being evaluated. Metallurgical evaluation as well as high temperature tensile testing have been used to assess bondline cleanliness and mechanical integrity. (Author)

A82-35338 # Net shape components for small gas turbine engines. W. P. Schimmel and G. J. Quill (Williams International, Walled Lake, MI). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-96.* 9 p. Members, $2.00; nonmembers, $4.00.

Advanced manufacturing methods producing net shape components for both current and next-generation high performance gas turbine engines are described. A coordinated development program is being conducted to provide near-net shape components which will minimize machining costs, save critical materials, and in some cases improve component performance. The techniques used include the isothermal forging of titanium, titanium casting, hot isostatic pressing of titanium powder, diffusion-bonded dual property techniques, and a diffuser case fabrication process. Emphasis is placed on the unique demands of small gas turbine engines. O.C.

A82-35339 # Design and investigations of a three dimensionally twisted diffuser for centrifugal compressors. M. Jansen and M. Rautenberg (Hannover, Universität, Hanover, West Germany). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-102.* 9 p. 8 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Forschungsvereinigung Verbrennungskraftmaschinen; Deutsche Forschungsgemeinschaft *Contract No. SFB-61.*

A vaned diffuser has been designed for a 90 deg centrifugal compressor impeller having a highly distorted exit flow distribution, where the maximum flow angle difference across the diffuser width at the entrance is 29 deg. The vane inlet angle is matched to this flow angle distribution by imparting a three-dimensional twist to the diffuser vanes. Mappings of total pressure ratio and efficiency against mass flow for the cases of a twisted diffuser compressor and a compressor using a conventional, cambered vane and straight channel diffuser are compared. Twisted diffuser performance is discussed in light of detailed flow field measurements both before and behind the diffuser, as well as the static pressure distribution along the diffuser. O.C.

A82-35340 # Influence of casing treatment on the operating range of axial compressors. J. Paulon (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) and D. Dehondt (Turboméca, S.A., Bordes, Pyrénées-Atlantiques, France). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-103.* 9 p. 9 refs. Members, $2.00; nonmembers, $4.00.

A theoretical study has been conducted in order to clarify the effect of casing treatment by cutting circular grooves on the performance of axial flow compressors. Rules for determining the groove depths have been established which account for the surge margin improvement obtained in some cases and make it possible to dismiss inefficient geometric configurations. Such parameters as groove length and position do not seem to be critical; however, optimum results are obtained when the treated length is smaller than the chord projection on the axis, and the groove is centered on that chord or slightly shifted upstream. V.L.

A82-35342 # The effect of NaCl/g/ in high temperature oxidation. J. G. Smeggil and N. S. Bornstein (United Technologies Research Center, East Hartford, CT). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-106.* 5 p. 6 refs. Members, $2.00; nonmembers, $4.00.

Experiments have been carried out to investigate the effect of gaseous NaCl on the oxidation of materials used in gas turbines. The materials investigated included NiAl, Mar M-509, NX-188, Ni-10Mo, Ni-25Cr, Ni-40Cr, and Ni-40Cr-5Si. It is found that very low levels of gaseous NaCl (0.1-100 ppm) approaching those expected for some marine and industrial turbine applications are sufficient to markedly increase the oxidation rate of turbine alloys and coatings, with the magnitude of the effect related to the alloy substrate chemistry. Alloys rich in molybdenum appear to be most susceptible to this form of corrosion. V.L.

A82-35344 # Effect of the rear stage casing treatment on the overall performance of a multistage axial-flow compressor. Y.-L. Gao (Shenyang Aeroengine Co., Shenyang, People's Republic of China) and K.-M. Li (Shenyang Aeroengine Research Institute, Shenyang, People's Republic of China). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-110.* 5 p. 10 refs. Members, $2.00; nonmembers, $4.00.

The effect on high speed stall margin and efficiency of tip treatment at the rear stages of a compressor is discussed. A nine-stage engine compressor was tested in a rig with and without casing treatment on the tip sections of the last three rotors, and another series of tests was conducted on a modified compressor with twisted rotor blades in the rear stages. The results showed that the casing treatment of rear stages in a multistage axial-flow compressor could effectively improve the surge margin of the compressor at high speeds. The casing treatment had almost no effect on the efficiency of the compressor with blades untwisted, while at the inlet stage it mainly improved the distortion tolerance and the performance of the compressor at low and medium speeds. C.D.

A82-35345 # On the performance prediction of a centrifugal compressor scaled up. T. Mashimo (Meiji University, Kawasaki, Japan), I. Ariga (Keio University, Yokohama, Japan), T. Sakai (Tokyo Science University, Tokyo, Japan), and I. Watanabe (Kanto Gakuin University, Yokohama, Japan). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-112.* 9 p. 18 refs. Members, $2.00; nonmembers, $4.00. Research sponsored by the Dengyosha Machine Works, Ehara Manufacturing Co., Fuji Electric Co., Hitachi, Ltd., Hitachi Shipbuilding and Engineering Co., et al.

A centrifugal compressor performance prediction method, in which each loss generated within the compressor stage is estimated by recognizing the individual relationship between it and the velocity distribution, the Reynolds number, and the Mach number, was investigated over a wide range of sizes and types. Three compressors having impellers of 154, 112, and 78 mm diameters were employed in the test, and the results were analyzed to obtain calculation formulas for the losses. By referring to unpublished test data, it was confirmed that the formulas could be applied to predict the performance levels of larger compressors with impellers up to 640 mm. From the results, it could be deduced that (1) the wall friction losses and the secondary flow losses within the compressor decreased with increase of impeller size, and (2) the leakage flow losses increased when scaling up the compressor, even when tip clearance or blade height were held constant. C.D.

A82-35346 # Cryogenic turbine testing. R. J. Iannuzzelli and R. E. Filippi (Air Products and Chemicals, Inc., Allentown, PA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-113.* 9 p. 8 refs. Members, $2.00; nonmembers, $4.00.

Problems encountered in data acquisition during turbine machinery testing in a cryogenic environment are discussed with reference to measurement and sensing errors, overall data uncertainty and its implications, and surface roughness effects on wheel losses. It is shown that data quality can be insured by using the power balance as an indicator of data uncertainty. Data uncertainty due to heat transfer effects can be minimized by adequately insulating the test vehicle. The measurement of temperature downstream of a turbine wheel should be made after a flow-mixing device to avoid adverse temperature distributions which could lead to sensing errors. And, finally, computerization of the data acquisition function can significantly reduce data uncertainty. V.L.

A82-35348 * # A computational design method for transonic turbomachinery cascades. H. Sobieczky (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für theoretische Strömunsgmechanik, Göttingen, West Germany) and D. S. Dulikravich (NASA, Lewis Research Center, Cleveland, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-117.* 10 p. 17 refs. Members, $2.00; nonmembers, $4.00.

This paper describes a systematical computational procedure to find configuration changes necessary to modify the resulting flow past turbomachinery cascades, channels and nozzles, to be shock-free at prescribed transonic operating conditions. The method is based on a finite area transonic analysis technique and the fictitious gas approach. This design scheme has two major areas of application. First, it can be used for design of supercritical cascades, with applications mainly in compressor blade design. Second, it provides subsonic inlet shapes including sonic surfaces with suitable initial data for the design of supersonic (accelerated) exits, like nozzles and turbine cascade shapes. This fast, accurate and economical method with a proven potential for applications to three-dimensional flows is illustrated by some design examples. (Author)

A82-35350 # A critical appraisal of some current incidence loss models for the stator and rotor of a mixed flow gas turbine. F. Fairbanks (Hatfield Polytechnic, Hatfield, Herts., England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-120.* 6 p. 5 refs. Members, $2.00; nonmembers, $4.00.

Current models predicting the loss due to incidence in radial turbomachinery are briefly reviewed, and a new incidence loss model, designated the shock loss model, is proposed. As with the other models, the shock loss model assumes a change in the tangential components of the kinetic energy at entry but thereafter uses only fundamental principles, obviating the difficulty of changing the definition of the loss according to the flow conditions. Analysis is carried out for the stator blades of a radial turbine, and it is found that the shock loss model, as derived, overestimates by approximately 80% the overall loss parameter for the stator passage. It is concluded that none of the loss models reviewed, including the shock loss model, is satisfactory since they do not account for flow pattern in the rotor or stator passages. V.L.

A82-35351 # A mixed-flow cascade passage design procedure based on a power series expansion. R. A. Novak and G. Haymann-Haber. *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-121.* 15 p. 10 refs. Members, $2.00; nonmembers, $4.00.

A blade-to-blade design technique is presented which will quickly develop the unique blade shape implied by the meridional-plane input specifications, which could then be treated as a preliminary version of a final blade shape, to be modified in accordance with the designer's perception of neglected real flow effects. The flow is assumed to be steady, two-dimensional on surfaces of revolution, nonviscous, and nonrotational. The process readily gives solutions for subsonic, supersonic, or mixed-flow conditions. The solutions are channel solutions, and realistic only in situations where a shock-free flow is possible. Particularly for supersonic compressor cascades, the results must be treated with caution. Numerous examples are given, with comparisons with experimental data and other analytic solutions. C.D.

A82-35352 # Development and application of a performance prediction method for straight rectangular diffuser. F. S. Bhinder and M. H. Al-Modafar (Hatfield Polytechnic, Hatfield, Herts., England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-122.* 5 p. 7 refs. Members, $2.00; nonmembers, $4.00. Research supported by Rolls-Royce, Ltd.

A brief description of a step-by-step method for predicting the performance of straight rectangular diffuser is given. The theory has been used to predict the performance of rectangular diffusers for which comprehensive experimental data are available and the agreement between experimental and predicted results is very close. The method is shown to be applicable over a wide range of inlet Mach numbers, aspect ratios, and Reynolds numbers. When the diffuser divergence angle is less than 8 deg, the static pressure recovery coefficient is only slightly dependent on the aspect ratio, provided the latter is greater than one. However, for diffuser divergence angle greater than 12, the optimum entry aspect ratio is around unity. The inlet blockage has a significant influence on the pressure recovery for all geometrical configurations, entry Mach numbers, and entry Reynolds numbers. C.D.

A82-35353 # Performance analysis of the test results on a two-stage transonic fan. C. Baoshi and Z. Tianyi (Shenyang Aeroengine Research Institute, Shenyang, People's Republic of China). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-123.* 5 p. Members, $2.00; nonmembers, $4.00.

Test results obtained from a two-stage fan are analyzed and the reasons for failure to attain the design performance target are presented. It was found that the design airflow and pressure ratio of the fan were attained, but the efficiency and stall margin were far lower than the design values. The problems found in stage one were that the design performance parameters selected on the basis of the original tests were too high, that the partspan shroud added onto the rotor degraded the performance and completely changed the spanwise flow field, and that the modifications on the flowpath and chord length of the stator caused an excessively high inlet Mach number at the stator hub, resulting in high losses and flow separation there. The high load and high incidence at the hub of the second rotor caused higher losses and reduced the stall margin of the fan, and the stages were inadequately matched. C.D.

A82-35358 # Accuracy expectations for gas turbine and centrifugal compressor performance testing. T. C. Heard and E. J. Hipp (General Electric Co., Schenectady, NY). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-128.* 13 p. 13 refs. Members, $2.00; nonmembers, $4.00.

A simple procedure for estimating instrument errors and for assessing their influences on the final results is outlined. The procedure uses the statistical approach of first estimating the uncertainty of each measurement or piece of data to be used, and then combining their effects in prescribed ways to estimate the uncertainties of performance functions. Probable error uncertainty is defined as a band of such width that there is a 50 percent chance of including the true value. As an example, the p/e uncertainties are estimated for testing a gas turbine driven compressor operating at 25,000 horsepower and at a relatively low pressure ratio on natural gas. Uncertainties are found for the compressor shaft power, the gas turbine shaft power, the gas turbine heat rate, and the gas turbine and compressor considered as a single package. C.D.

A82-35362 # The potential impact of future fuels on small gas turbine engines. J. A. Saintsbury (Pratt and Whitney Aircraft of Canada, Ltd., Longueuil, Quebec, Canada) and P. Sampath. *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-133.* 8 p. 11 refs. Members, $2.00; nonmembers, $4.00.

The present investigation is based on the assumption that in the not too distant future aviation gas turbine fuels as they are known today will not be available and that it will be necessary to accept either degraded fuels or fuels derived from sources presently considered unconventional. The investigation addresses gas turbine fuels in general and their effect on combustion systems, giving particular attention to small gas turbine engine combustion systems. It is found that the impact of future fuels on aircraft gas turbine engines will vary depending on engine size and type, because of differences in fundamental design criteria, and constraints of weight, cost, and size. As a first step towards fuel conservation pending availability of viable alternate energy sources, broadened specification fuels with modest relaxations in aromatics, and freeze point will likely be in use in the near term, but fuels from alternate sources will be longer term because of the need to develop an appropriate production industry. G.R.

A82-35363 An inviscid-viscous interaction treatment to predict the blade-to-blade performance of axial compressors with leading edge normal shock waves. W. J. Calvert (National Gas Turbine Establishment, Farnborough, Hants., England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-135.* 12 p. 23 refs. Members, $2.00; nonmembers, $4.00.

An inviscid-viscous interaction treatment has been developed to predict the blade-to-blade flow in axial compressors operating with supersonic inlet condi-

ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1054. 9 p.

Analytical studies on intershaft cylindrical roller bearings for advanced gas turbine engines configured with counter-rotating shafts showed advantages in fatigue life and internal radial clearance control when the outer ring was mounted on the low speed rotor and the inner ring on the high speed rotor. Parametric rig tests on eight bearings showed that the primary drivers on roller end wear were roller-to-guide flange end clearance, outer race preload and internal radial clearance. Test results showed concentric roller end wear patterns on all test bearings and varying levels of wear. The performance data was used to improve prediction techniques for bearing heat generation and temperatures. (Author)

A82-37682 # Evaluation of a multivariable control design on a variable cycle engine simulation. S. J. Przybylko (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH)and S. M. Rock (Systems Control Technology, Inc., Palo Alto, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1077.* 8 p. 13 refs. Contract No. F33615-77-C-2096.

It is pointed out that aircraft turbine engine propulsion control systems have been the focus of extensive development in recent years. Future engine cycles have been defined and include a significant variable geometry capability to the extent that the thermodynamic engine cycle varies over wide limits. The number of actuated variables was expanded, and resulting control strategies require extension of the current advanced multivariable control methodologies. The present investigation is concerned with the evaluation of a multivariable control designed for the JTDE GE 23 variable cycle engine. Attention is given to a description of the Joint Technology Demonstrator Engine (JTDE), the control requirements, a control structure overview, and the computer simulation and evaluation procedure. G.R.

A82-37683 * # Flight evaluation of a digital electronic engine control system in an F-15 airplane. L. P. Myers, K. G. Mackall, F. W. Burcham, Jr. (NASA, Ames Research Center, Edwards AFB, CA), and W. A. Walter (United Technologies Corp., Pratt and Whitney Aircraft Group, West Palm Beach, FL). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1080.* 14 p. 6 refs.

Benefits provided by a full-authority digital engine control are related to improvements in engine efficiency, performance, and operations. An additional benefit is the capability of detecting and accommodating failures in real time and providing engine-health diagnostics. The digital electronic engine control (DEEC), is a full-authority digital engine control developed for the F100-PW-100 turbofan engine. The DEEC has been flight tested on an F-15 aircraft. The flight tests had the objective to evaluate the DEEC hardware and software over the F-15 flight envelope. A description is presented of the results of the flight tests, which consisted of nonaugmented and augmented throttle transients, airstarts, and backup control operations. The aircraft, engine, DEEC system, and data acquisition and reduction system are discussed. G.R.

A82-37685 # Prediction of cruise missile inlet peak instantaneous distortion patterns from steady state and turbulence data using a statistical technique. J. A. Forner and J. M. Manter (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1085.* 10 p. 7 refs.

The commonly accepted method of assessing inlet engine compatibility is to evaluate the engine capability to operate stall-free with the peak instantaneous distortion levels delivered by the inlet. The development of inlet systems for aircraft and missiles requires, therefore, an assessment of peak instantaneous distortion. The present investigation is concerned with a statistical procedure for predicting instantaneous peak distortion patterns, taking into account an approach based on a method considered by Stevens et al. (1980). The investigation has the objective to expand the data base supporting the method by comparing predicted distortion values to analog screened values for three cruise missile inlets. G.R.

A82-37688 # Electronic control for small engines. W. H. Hermann, J. A. Weber, and E. E. Ervin (General Motors Corp., Detroit Diesel Allison Div., Indianapolis, IN). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1126.* 8 p.

A description is presented of an electronic system for the control of the small engines of the Model 250 series, which are used in many helicopter applications (single and twin) and in selected turboprop applications. The requirements for developing the Model 250 electronic control concept are examined. The electronic control is active throughout the engine operating regime. The principal features of the electronic control system are related to start temperature limiting, altitude-compensated surge avoidance, rotor speed governor, loss-of-load protection, backup analog governor, backup loss-of-load protection, manual backup, and diagnostics and readout. The principal components of the Model 250 electronic fuel control system are shown in a graph. A digital control unit is a new component which is currently being developed for this system. G.R.

A82-37689 # Reliability design study for a fault-tolerant electronic engine control. D. E. Warner and W. H. Hermann (General Motors Corp., Detroit Diesel Allison Div., Indianapolis, IN). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1129.* 8 p.

The Advanced Turbine Engine Study (ATES) has the objective to define the engines which are to power the advanced aircraft of the late 1980's. Digital electronic controls are required for the operation of advanced variable cycle engines for high performance aircraft. Problems of failure tolerance and reliability arising in connection with the control system were investigated in a study on Full-Authority, Fault-Tolerant Electronic Engine Controls (FAFTEEC). A description is presented of the highlights and the significant results of the study. Attention is given to the baseline system which was defined to meet mission, aircraft, and engine requirements derived from the ATES program. The module database is considered along with alternate fault-tolerant system designs, specific design tools utilized in the design of fault-tolerant systems, and aspects of system evaluation. G.R.

A82-37690 # Design concepts of an advanced propulsion monitoring system. A. R. Mulukutla and V. W. Lawson (General Electric Co., Cincinnati, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1130.* 5 p. Contract No. F33615-79-C-2092.

A number of tests of engine health monitoring systems have demonstrated the feasibility of acquiring and recording some of the engine health related data. An American aerospace company is developing an Advanced Propulsion Monitoring System (APMS) to remedy some of the shortcomings of previous systems with regard to automatic analysis and presentation of data in useful form. After the conduction of tests of the APMS in the laboratory, some of the hardware and software are being modified for a demonstration test on a different engine with a different operating cycle. A description is presented of some of the details of the demonstration configuration. Attention is given to the demonstration test objectives, a system overview, and a software overview. G.R.

A82-37691 * # Optical tip clearance sensor for aircraft engine controls. G. L. Poppel (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH), D. T. F. Marple (General Electric Co., Schenectady, NY), and R. J. Baumbick (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1131.* 9 p. Contract No. NAS3-21843.

Aircraft gas turbine performance and efficiency are related to airfoil tip clearance. The possibility has been considered to obtain optimum performance and efficiency by reducing clearance to a safe minimum with the aid of a closed-loop tip clearance control system, which utilizes a tip clearance sensor. The use of optical sensing methods appears to represent a potential solution to the tip clearance measurement problem. Principles of sensor operation are discussed along with dimensional considerations and diffraction limitations. A description is presented of the study of the feasibility of a certain sensor, taking into account the test rig system, the optical components, and the mounting tube. Attention is also given to the operation of the feasibility-study sensor, performance estimations, the optical fiber bundle, light beam refraction, and aspects of aircraft engine implementation. G.R.

A82-37692 # Advanced exhaust nozzle concepts using spanwise blowing for aerodynamic lift enhancement. J. G. Doonan and W. H. Davis, Jr. (Grumman Aerospace Corp., Bethpage, NY). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1132.* 16 p. 8 refs. Contracts No. F33615-79-C-3009; No. F33615-77-C-3045.

Underwing and wing trailing edge flap spanwise blowing configurations employing a secondary nozzle were tested in a wind tunnel investigation in order to assess their STOL performance enhancement effects, for the case of a 1990s-technology twin-engined fighter with close-coupled canard planform. The two spanwise blowing concepts were incorporated in a two-dimensional, thrust vectoring and convergent-divergent flow geometry primary exhaust nozzle. The advantages of spanwise blowing are identified through an analysis of wind tunnel 1/8-scale model aircraft force and surface pressure data. The underwing and trailing edge methods have demonstrated induced lift coefficients equal to 33% and 28% of the unpowered aerodynamic lift coefficient, respectively. Consideration is also given to lift augmentation by means of the primary thrust-vectoring nozzles. O.C.

A82-37693 # Thrust reverser induced flow interference on tactical aircraft stability and control. C. Chiarelli, D. Lorincz, and B. Hunt (Northrop Corp., Aircraft Div., Hawthorne, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1133.* 11 p. 6 refs.

It is pointed out that the vulnerability of runways to bomb damage is a major threat to the operational effectiveness of tactical aircraft. Future designs will, therefore, very likely be required to operate from short undamaged portions of runway. The most critical problem in achieving STOL is to reduce landing distance because conventional tactical aircraft require landing lengths which are several times greater than their takeoff lengths. An approach involving the use of a thrust reverser represents a possible solution to the problem. Attention is given to a study of reverser jet/tunnel wall interference conducted in a low speed wind tunnel, results for a thrust reversing version of the F/A-18A aircraft, and wind tunnel data for reverser effects on the stability and control characteristics of an advanced fighter configuration. G.R.

A82-37694 # Advanced nozzle integration for air combat fighter application. H. W. Wallace (McDonnell Aircraft Co., St. Louis, MO) and D. L. Bowers (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1135.* 13 p.

Analytical and experimental investigations have been conducted in an Advanced Nozzle Concepts program, with a view to establishing design guidelines for future tactical fighters. The configurations studied include high and low aspect ratio two-dimensional nozzles, as well as advanced axisymmetric nozzle, installed in air-to-air and air-to-surface primary mission tactical aircraft of generically different design. Attention is given to the air-to-air vehicle, for which nozzle configurations were wind tunnel tested at speeds from Mach 0.6 to 1.5 in order to determine relative installation drag and aerodynamic interaction effects due to thrust vectoring and reversing. It is shown that thrust reversal for STOL operation and thrust vectoring for trim enhancement at high lift coefficients may be achieved with a small penalty in takeoff gross weight. O.C.

A82-37695 # Experimental performance evaluation of 'ventilated mixers' - A new mixer concept for high bypass turbofan engines. J. S. Sokhey (Boeing Commercial Airplane Co., Seattle, WA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1136.* 13 p. 7 refs.

An experimental investigation of two Ventilated Mixer cold/hot dual flow nozzle models is presented in which total axial thrust, mixer surface static pressures are measured, and rake surveys are taken of total pressure and temperature taken at the charging station, mixing plane, and nozzle exit plane. Greater accuracy than that normally obtainable was achieved in the definition of nozzle model surfaces through the numerically controlled fabrication of each unit from a single stainless steel block. Ventilation slots were machined through the mixer lobe walls in order to improve mixer performance through boundary layer energization, which inhibits primary flow separation. Analysis of the test results shows the ventilation concept to yield a significant reduction in total mixer pressure loss, with additional improvements noted in mixing effectiveness and jet noise reduction. Ventilated mixer flow characteristics are compared with those of unventilated mixers, and the consequence of this nozzle design's applications to existing turbofan engines is discussed. O.C.

A82-37698 # A cost modeling approach to engine optimization. D. G. Culy and R. C. Gunness (Garrett Turbine Engine Co., Phoenix, AZ). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1185.* 8 p. Navy-USAF-sponsored research.

An outline is provided of an engine optimization study carried out as part of the Navy Advanced Technology Engine Study (ATES) Program. The objective of the study was to determine a set of engine cycle parameters, and then to establish a set of component technologies and a development strategy which would result in the lowest peacetime Life Cycle Cost (LCC) for six different aircraft fleets. For simplicity, one tactical system (using an engine in the middle of the study size range) is discussed. Preliminary sizing was based on conventional optimization criteria. The LCC model used is briefly described, and the scenario for the mission is given. The study results are shown in terms of both LCC and aircraft takeoff gross weight. G.R.

A82-37709 # Models for a turbulent premixed dump combustor. N. Darabiha, S. M. Candel (Ecole Centrale des Arts et Manufactures, Châtenay-Malabry; ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France), and E. Esposito (Ecole Centrale des Arts et Manufactures, Châtenay-Malabry, Hauts-de-Seine, France). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1261.* 9 p. 23 refs. Research supported by the Société Nationale d'Etude et de Construction de Moteurs d'Aviation.

The modeling of the process of ignition and flame spreading in a premixed dump combustor is discussed. The treatment, which is essentially numerical, relies on a time-split finite difference method. Mass-averaged conservation equations are used in order to represent the flow dynamics. A simple chemically reacting system is assumed, and combustion is simulated using two models. The reaction rate is kinetically controlled in the first model. The second model is based on the coherent flame concept of Marble and Broadwell (1977). Time-dependent flame spreading calculations are described in some detail. C.R.

A82-37710 * # Turbulence measurements in a confined jet using a six-orientation hot-wire probe technique. S. I. Janjua, D. K. McLaughlin (Dynamics Technology, Inc., Torrance, CA), D. G. Lilley (Oklahoma State University, Stillwater, OK), and T. Jackson. *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1262.* 18 p. 21 refs. Contract No. NAG3-74.

The six-orientation hot-wire technique is applied to nonreacting axisymmetric flowfields, obtaining measurements of time-mean and rms voltages at six different orientations, thus providing enough information to determine the time-mean velocities, turbulence intensities, and shear stresses. At each location in the flow, there are six different values of each of the above quantities that can be obtained using six sets of measurements of three adjacent orientations. Flowfield surveys of both swirling and nonswirling confined jets are used to calculate estimates of the mean velocity components and the normal and shear turbulent stresses, and comparisons with independent data are made. A sensitivity analysis of the data reduction technique demonstrates that the largest uncertainties are to be expected in the turbulent shear force estimates. C.D.

A82-37712 # Current techniques for jet engine test cell modeling. R. J. Freuler (Ohio State University, Columbus, OH) and R. A. Dickman (General Electric Co., Aircraft Engine Group, Cincinnati, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1272.* 16 p.

A model test program to demonstrate acceptable aerodynamic performance for a jet engine test cell with a 26 ft by 26 ft cross section is described. Utilizing a 1/17.6 scale plexiglass model of the full-scale jet engine test cell and a modified turbine powered simulator, a technique is developed in conjunction with an online data acquisition system (outlined in a block diagram) by which a maximum amount of test information can be acquired, processed, and presented to the jet cell model test engineer in a manner responsive enough to permit the 'immediate' analysis of a test point. A matrix of inlet/cell/exhaust geometries is model tested to demonstrate their interaction on the test cell system aerodynamics. This model test demonstrates acceptable test cell aerodynamics for a 26 ft by 26 ft cell geometry with a three to six inch water inlet pressure drop and a cell bypass ratio greater than 1. Specifically: no vortices are formed in the simulated engine bellmouth, the front cell velocity distortion is less than 0.20, the tip circumferential inlet distortion is less than 0.5% and the tip radial distortion is less than 0.25%. The axial pressure gradients as measured on cell walls and the simulated engine fan cowling are well below 0.5 inches of water, which corresponds to less than 0.1% correction to measured thrust due to base pressure differences. N.B.

A82-37716 * # Aerodynamic performance of high turning core turbine vanes in a two-dimensional cascade. J. R. Schwab (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, and ASME, Joint Propulsion Conference, 18th, Cleveland, OH, June 21-23, 1982, AIAA Paper 82-1286.* 19 p. 6 refs.

Experimental and theoretical aerodynamic performance data are presented for four uncooled high turning core turbine vanes with exit angles of 74.9, 75.0, 77.5, and 79.6 degrees in a two-dimensional cascade. Data for a more conservative 67.0 degree vane are included for comparison. Corection of the experimental aftermix kinetic energy losses to a common 0.100 centimeter trailing edge thickness yields a linear trend of increased loss from 0.020 to 0.025 as the vane exit angle increases from 67.0 to 79.6 degrees. The theoretical losses show a similar trend. The experimental and theoretical vane surface velocity distributions generally agree within approximately five percent, although the suction surface theoretical velocities are generally higher than the experimental velocities as the vane exit angle increases. A82-37764 # R & D on composite rotor blades at Agusta. V. Giavotto (Milano, Politecnico, Milan, Italy), V. Caramaschi, and G. C. Maffioli (Costruzioni Aeronautiche Giovanni Agusta S.p.A., Varese, Italy). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 16 p. 5 refs.

An R&D program aimed at the development of improved methods for the construction of composite rotor blades is reviewed with reference to the development of a finite element code (Program HANBA 2) for blade section analysis and the development of reliable models for the study of composite behavior and failure criteria. Program HANBA 2 is based on finite element discretization in the section plane only, thus allowing the computation of beam solutions for any shape and material anisotropy or inhomogeneity of the section concerned. In particular, the code allows the evaluation of interlaminar and joint stresses in nonlinear material models with unbalanced anisotropy. Composite rotor blades have been designed and manufactured using the methods developed and are now undergoing static and fatigue tests. V.L.

A82-37785 * # A simple system for helicopter Individual-Blade-Control and its application to stall flutter suppression. N. D. Ham and T. R. Quackenbush (MIT, Cambridge, MA). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 10 p. NASA-sponsored research.

A new, advanced type of active control for helicopters and its application to a system for stall flutter suppression is described. The system, based on previously developed M.I.T. Individual-Blade-Control hardware, employs blade-mounted accelerometers to sense torsional oscillations and feeds back rate information to increase the damping of the first torsion mode. A linear model of the blade and

HELICOPTER NIGHT VISION SYSTEM SIMULATION EVALUATION Final Report

Dec. 1981 138 p refs
(Contract N62269-80-C-0346)
(AD-A110505; OR-16551) Avail: NTIS HC A07/MF A01 CSCL 01/3

Simulation experiments demonstrated the ability of the pilot and copilot to fly a night mission at low altitudes, ranging from 50 to 150 feet AGL, in a CH-53D simulation with the night visionics equipment package described previously. Phases I and II HNVS simulation studies indicated that enroute flight profiles over the simulator's rolling terrain can be accomplished at airspeeds ranging from 60 to 80 knots with clearance altitudes averaging 100 feet. This study was conducted with a revised terrain model with improved altitude feedback cues that produced higher clearance altitudes and somewhat lower airspeeds than the prior simulations. The actual speeds and altitudes will be verified in the planned HNVS flight tests. The simulation confirmed the minimum system requirement of a gimballed FLIR with a navigation system and with ancillary hardware such as a symbol generator. Although this experiment required no data be generated on dead reckoning versus navigation system requirements, both pilot performance and opinion data reiterated the reduced crew station workload with Doppler command steering information. Incorporation of the navigation capability of the Control Display Unit also was instrumental in further reducing the navigation workload. GRA

(Grant NsG-3306)
(NASA-CR-3563; NAS 1.26:3563) Avail: NTIS HC A05/MF A01 CSCL 21E

The flow, atomization and spreading of flashing injector flowing liquids containing dissolved gases (jet/air) as well as superheated liquids (Freon II) were considered. The use of a two stage expansion process separated by an expansion chamber, ws found to be beneficial for flashing injection particularly for dissolved gas systems. Both locally homogeneous and separated flow models provided good predictions of injector flow properties. Conventional correlations for drop sizes from pressure atomized and airblast injectors were successfully modified, using the separated flow model to prescribe injector exit conditions, to correlate drop size measurements. Additional experimental results are provided for spray angle and combustion properties of sprays from flashing injectors. Author

TRANSIENT SIMULATION OF GAS TURBINES INCLUDING THE EFFECTS OF HEAT CAPACITY OF THE SOLID PARTS Ph.D. Thesis

Jaakko Larjola 1982 144 p refs
(ISBN-951-752-496-X; Rept-82-A1) Avail: NTIS HC A07/MF A01

The simulation of low frequency transients (such as acceleration, deceleration) of different open cycle gas turbine types is studied. The effects of heat transfer between process gas and solid structure is emphasized. Correcting equations for these effects are developed and the transient properties of each component are then evolved from the static ones with these equations. The heat transfer effects alter significally e.g. the surge margin of the compressor. Simulation model includes intercooler and recuperator. The programming language is CSMP. S.L.

EFFECTS OF HIGH VOLTAGE TRANSMISSION LINES ON NON-DIRECTIONAL BEACON PERFORMANCE Final Report, Jun. 1980 - Oct. 1981
Ismail Ibrahim and Raymond Luebbers Washington FAA Oct. 1981 184 p refs
(Contract DTFA01-80-C-10072)
(AD-A112311; QUEE-FAA-1-2; FAA-RD-81-82) Avail: NTIS
HC A09/MF A01 CSCL 17/7

The potential for high-voltage transmission lines to interfere with the operation of non-directional beacons through the mechanisms of coronagenerated radio noise or passive reradiation of the desired signal has been assessed by use of computer prediction models. The generated noise levels were calculated for both AC and DC lines using methods found in the appropriate literature which have previously been compared with measured data. The reradiated signal levels were computed using a moment-method wire model computer program. This approach was validated by measurements made and reported herein. For all situations considered, it was concluded that locating an NDB near a high-voltage transmission line should not impair the function of the NDB due to either corona noise or passive reradiation from the line. A RESULT IN THE THEORY OF SPIRAL SEARCH
Walter R. Nunn Mar. 1980 16 p refs
(Contract N00014-76-C-0001)
(AD-A112481; CNA-PP-274) Avail: NTIS HC A02/MF A01
CSCL 17/7

This note presents a result in the theory of spiral search which does not seem to be available in the literature in spite of its straightforward derivation and obvious applicability in certain types of 'real life' search problems. The result gives the probability of detection as a function of time for a class of prior distributions of search-object, i.e. target, position centered at the origin of the x,y plane. We restrict attention to a spiral-type search in which the searcher covers the AOU(area of uncertainty) in concentric rings, moving out from the center. In the common case that the prior density is circular normal, the time to detection is seen to be approximately exponentially distributed. This is a somewhat counter-intuitive result in that the detection rate is constant, since it would appear that detection rate must decrease with time as the searcher moves from high probability areas to low probability areas. GRA

SURVEILLANCE SIMULATION TESTING OF TERMINAL AND EN ROUTE MODE S SENSORS Interim Report, Apr. - Aug. 1980
Robert E. Frack Jan. 1982 66 p
(FAA Proj. 034-241-510)
(AD-A112250; DOT/FAA/CT-81/16) Avail: NTIS
HC A04/MF A01 CSCL 17/7

A test and evaluation (T&E) was conducted to determine the surveillance characteristics of the Mode S (formerly the Discrete Address Beacon System (DABS) en route and terminal sensors operating with effective receive beam widths of 2.4 deg. and 3.4 deg. The tests were conducted at the FAA Technical Center for terminal and enroute Mode S configurations having maximum ranges of 60 and 200 nautical miles (nmi), respectively. Surveillance loading was simulated using an aircraft reply and interference environment simulator (ARIES) to provide Mode S, Air Traffic Control Radar Beacon System (ATCRBS), or a mixture of the two types of aircraft. Surveillance characteristics were measured by determining the percent detection, blip scan ratio, Mode 3/A and C reliability, Mode S identifier (ID) reliability, and the number of replies per report or interrogations per scan for both types of aircraft. It was concluded that increasing the effective receive beam width had negligible impact on the surveillance characteristics of either sensor operating with simulated Mode S targets. Increasing the effective receive beam width improved the percent detection and Mode C reliability for both sensors operating with simulated ATCRBS targets. GRA

DESIGN AND IMPLEMENTATION OF EFFICIENT ALGORITHMS FOR AUTOMATIC DETERMINATION OF CORRECTED SLANT RANGE Final Report
D. W. Stout and R. G. Mulholland Feb. 1982 22 p refs
(FAA Proj. 975-200-10A)
(AD-A112248; FAA-CT-81-30) Avail: NTIS HC A02/MF A01 CSCL 17/7

This report introduces a systematic approach to the design of algorithms for evaluating the corrected slant range in a radar surveillance system. Applications include air traffic control (ATC) operations requiring real-time continuous computation for a multitude of targets without overtaxing available computational resources. From the point of view of accuracy, utilization of memory, and computational speed, the design technique is capable of providing an algorithm that is superior to the corrected slant range technique presently employed in the National Airspace System (NAS). TERMINAL AIR TRAFFIC CONTROL WITH SURVEILLANCE DATA FROM THE MODE S SYSTEM: RESULTS OF SYSTEM DEMONSTRATIONS TO FIELD CONTROLLERS Final System Demonstration Report, period ending May 1981
Verne Tallio and Haim Gabrieli Feb. 1982 76 p refs
(Contract DTFA01-81-C-10001)
(AD-A112632; MTR-81T7; DOT/FAA/CT-82/11) Avail: NTIS HC A05/MF A01 CSCL 17/7

This report describes the results of a series of system demonstrations of a modified version of the ARTS III system (ADS2) which was developed to operate with target reports provided by the Mode S system. The demonstrations were conducted at the FAA Technical Center with field controllers from the Philadelphia ARTS III facility. The report contains a compilation of the controllers' opinions and comments on the operational characteristics of the new system. This demonstration cannot be considered a comprehensive test and evaluation effort; however, with regard to those system capabilities which were demonstrated, the controllers found no major technical or operational obstacles which would impact the system implementation in an operational environment. AUTOPILOT: A DISTRIBUTED PLANNER FOR AIR FLEET CONTROL Interim Report
Perry W. Thorndyke, David McArthur, and Stephanie Cammarata Jul. 1981 34 p refs
(Contract MDA903-78-C-0029; ARPA Order 3460)
(AD-A107139; RAND/N-731-ARPA) Avail: NTIS HC A03/MF A01 CSCL 17/7

Distributed planning requires both architectures for structuring multiple planners and techniques for planning, communication, and cooperation. We describe a family of systems for distributed control of multiple aircraft, in which each aircraft plans it own flight path and avoids collisions with other aircraft. AUTOPILOT, the kernel planner used by each aircraft, comprises several processing experts that share a common world model. These experts sense the world, plan and evaluate flight paths, communicate with other aircraft, and control plan execution. We discuss four architectures for the distribution of airspace management and planning responsibility among the several aircraft occupying the airspace at any point in time. The architecture differ in the extent of cooperation and communication among aircraft. Author (GRA)

SCENARIOS FOR EVOLUTION OF AIR TRAFFIC CONTROL
Robert Wesson, Kenneth Solomon, Randall Steeb, Perry W. Thorndyke, and Keith Wescourt Nov. 1981 82 p refs
(Contract MDA903-81-C-0211)
(AD-A112566; RAND/R-2698-FAA) Avail: NTIS HC A05/MF A01 CSCL 17/7

To accommodate the predicted demand for air traffic service in the year 2000, computer technology must augment human control skills. Preliminary laboratory studies have demonstrated that computer programs can track aircraft, predict their future paths, generate conflict-free clearances, and monitor them for compliance-all automatically. This technology could automate most routine ATC tasks and could change the human role in ATC to that of a system manager. How to make the transition to such a system from the present one and exactly what the future specialist's role would be are the issues addressed by this report. We present three scenarios that delineate a spectrum of transition plans: a Baseline scenario in which the human controller's role is emphasized; and AERA (Automated En Route ATC) scenario in which computers assume the primary control responsibility and perform most ATC functions autonomously; and a Shared Control scenario in which automated, individually invokable modules assist a human specialist who retains the primary responsibility for control. GYRO SYSTEMS (SELECTED PAGES)
D. S. Pelpor 19 Mar. 1982 87 p Transl. into ENGLISH of the mono. "Giroskopicheskiye Sistemy" Moscow, 1971 p 5-12, 97-105, 281-293, 431-436, 475-485
(AD-A113748; FTD-ID(RS)T-1768-81) Avail: NTIS HC A05/MF A01 CSCL 17/7

Operating principles are discussed for: (1) differentiating and integrating gyroscopes; (2) gyrostabilizers; (3) course gyros and gyroscopic sensors of the direction of the true vertical; and (4) inertial systems. Schematics are provided of each of these means for control of aircraft, rockets, and spacecraft as well as of their onboard instruments. A diagram of the layout of gyroscopes on the platform of a three dimensional space gyrostabilizer is included. A.R.H.

GRAVITY INDUCED POSITION ERRORS IN AIRBORNE INERTIAL NAVIGATION
Klaus-Peter Schwarz Dec. 1981 60 p refs
(Contract F19628-79-C-0075; AF Proj. 7600)
(AD-A113823; Rept-326; AFGL-TR-82-0030; SR-11) Avail: NTIS HC A04/MF A01 CSCL 17/7

The report investigates the feasibility of improving airborne inertial navigation by use of gravity field approximations which are more accurate than the normal model presently applied. The effect of the anomalous gravity field on positioning is investigated by using a simplified dynamical error model and by deriving analytical expressions for the steady state error via the state space approach. In this approach, changes in the anomalous gravity field are cast into the form of first-order differential equations which are related to a position dependent covariance representation of the gravity field by way of the vehicle velocity. Different possibilities for a state space model of the anomalous

tions and a normal shock wave at inlet to the blade passage. The treatment uses both direct and inverse modes of operation for the inviscid and viscous calculations, and thus it can model the separation of the suction surface boundary layer produced by the strong interaction with the shock wave. The inviscid flow is calculated by a time marching method and the viscous flow by integral methods for laminar and turbulent boundary layers. (Author)

A82-35366 # Application of high bypass turbofan computer simulation to flight and test data processing. J. F. Chapier and L. Levine (Avco Corp., Avco Lycoming Div., Stratford, CT). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-141.* 8 p. Members, $2.00; nonmembers, $4.00.

This paper describes the computer program used to compare gas turbine engine flight and static test results with a predicted standard engine computer simulation model. The program is conceived not only for a final presentation of engine performance, but also as a research tool to further analyze the validity of measurements and the assumptions used in data reduction. (Author)

A82-35371 # Effect of crossflows on the discharge coefficient of film cooling holes. N. Hay, D. Lampard, and S. Benmansour (Nottingham University, Nottingham, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London England, Apr. 18-22, 1982, Paper 82-GT-147.* 6 p. 9 refs. Members, $2.00; nonmembers, $4.00.

Film cooling is the standard method of cooling the stator and rotor blades in an aircraft gas turbine engine. Many parameters govern film cooling performance, but the most pertinent is the 'blowing parameter', a nondimensionalized parameter reflecting the mass flow emerging from the cooling hole. Knowledge of the discharge coefficient, Cd, of film cooling holes is vital in sizing film cooling holes at the design stage. The discharge coefficient depends both on the local geometry and the flow conditions upstream and downstream of the hole. The effect of coolant crossflow was examined by Rohde et al. (1969). No data are available on the combined effects of mainstream and coolant crossflows. The present investigation was undertaken to provide a more extensive data base. Further data on Cd for film cooling holes have been obtained, taking into account data on both the coolant and mainstream sides. For the simpler situation of crossflow on one side only, the data agree well with earlier published results. G.R.

A82-35373 * # The use of optimization techniques to design controlled diffusion compressor blading. N. L. Sanger (NASA, Lewis Research Center, Cleveland, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-149.* 11 p. 17 refs. Members, $2.00; nonmembers, $4.00.
(Previously announced in STAR as N82-14094)

A82-35374 # A practical approach to the design of multivariable control strategies for gas turbines. A. M. Foss (National Gas Turbine Establishment, Farnborough, Hants., England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-150.* 12 p. 15 refs. Members, $2.00; nonmembers, $4.00.

The requirement for gas turbine engines to operate over wider ranges has resulted in today's more sophisticated engines with multiple controls. Current control philosophy for such powerplants is to adopt separate control systems for each of the major components. However, interactions between the various control parameters involved may be large enough to degrade the transient performance of the overall system. In such cases a design strategy specifically aimed at such a system, may be better. In the considered multivariable approach, a multivariable design strategy has been applied to derive a multivariable controller. According to the definition of the term, a multivariable design strategy is a strategy which takes into account interactions in the plant to be controlled. A multivariable controller contains interaction terms in the controller. The practical application of a multivariable control scheme to an aircraft engine has been made feasible in connection with the development of the microprocessor. G.R.

A82-35380 # Scaling effects on leakage losses in labyrinth seals. S. L. K. Wittig, L. Dörr, and S. Kim (Karlsruhe, Universität, Karlsruhe, West Germany). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-157.* 5 p. 8 refs. Members, $2.00; nonmembers, $4.00.

The accurate prediction of leakage losses through labyrinth seals in gas turbine engines depends largely on exact measurements. As tolerance effects are important, scaled-up models are used for experimental analysis. Application to real size engine conditions is of predominant importance. Measurements in a newly developed test section over wide pressure ranges with geometrically similar straight-through seal models of different scale indicate that the flow coefficient is not independent of the scale chosen. In a first attempt to clarify these questions, the results obtained from various models were correlated using Fanno-line analysis with dimensionless integral friction coefficients. The results obtained reveal the necessity for simultaneous consideration of Reynolds and Mach-number effects as well as relatively small geometrical deviations. (Author)

A82-35383 # Dry friction damping mechanisms in engine blades. A. V. Srinivasan and D. G. Cutts (United Technologies Research Center, East Hartford, CT). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-162* 14 p. 11 refs. Members, $2.00; nonmembers, $4.00.

In the context of jet engines, significant vibration damping due to dry friction can occur at (1) shroud interfaces of fans and (2) the platform of turbine blades fitted with 'platform dampers'. Analytical and experimental studies in regard to this important source of nonaerodynamic damping of blade vibration are presented in this paper. Comparisons between results from analytical models and laboratory test data are made and discussed. (Author)

A82-35384 * # The influence of Coriolis forces on gyroscopic motion of spinning blades. F. Sisto, A. Chang, and M. Sutcu (Stevens Institute of Technology, Hoboken, NJ). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-163.* 6 p. 5 refs. Members, $2.00; nonmembers, $4.00. Grant No. NAG3-47.

Turbomachine blades on spinning and precessing rotors experience gyroscopically induced instabilities and forcing. With vehicle-mounted turbomachines, either constant or harmonic precession occurs, depending on vehicle or mount motion. Responses of uniform cantilever beams at arbitrary stagger, subjected to the noted rotor motion, are predicted in both self-excited and forced-excitation modes taking into account Coriolis acceleration. (Author)

A82-35385 # Integrated aircraft avionics and powerplant control and management systems. J. McNamara (Rolls-Royce, Ltd., Aero Div., Bristol, England) and A. G. Seabridge (British Aerospace Public, Ltd., Co., Warton Div., Preston, Lancs., England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-165.* 12 p. 7 refs. Members, $2.00; nonmembers, $4.00.

The need for integration of the powerplant, intake, and airframe in an aircraft has long been recognized as an essential requirement for maximizing performance achievement in combat aircraft, and the emergence of highly maneuverable and highly unstable aircraft configurations has enhanced the need for this integration. In the present study of powerplant control systems, a systems approach has, therefore, been adopted to ensure that the results obtained for an integrated control system are truly applicable to the combined system. Attention is given to a powerplant control system configuration, the data highway system, the powerplant control and management system, a system for the 1990's, and the benefits provided by an ideal system. It is pointed out that the optimum solution will ultimately be dictated by the constraints and objectives of the aircraft project. G.R.

A82-35387 # Measurements of heat transfer coefficients on gas turbine components. I - Description, analysis and experimental verification of a technique for use in hostile environments. B. Barry, A. E. Forest, and A. J. White (Rolls-Royce, Ltd., Derby, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-174.* 9 p. 9 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Ministry of Defence (Procurement Executive).

A method of determining local convective heat transfer coefficients around internally cooled components in a hostile flow environment is described. The method involves the measurement of the response of the wall temperature to perturbations in the coolant flow. A companion paper includes results obtained in cascades of turbine aerofoils using refined versions of the method. (Author)

A82-35388 # Measurements of heat transfer coefficients on gas turbine components. II - Applications of the technique described in part I and comparisons with results from a conventional measuring technique and predictions. R. J. Beacock, F. G. Horton, T. J. Kirker, and A. J. White (Rolls-Royce, Ltd., Derby, England). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-175.* 7 p. 5 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Ministry of Defence (Procurement Executive).

A82-35389 * # NASA research in aircraft propulsion. M. A. Beheim (NASA, Lewis Research Center, Cleveland, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-177.* 10 p. Members, $2.00; nonmembers, $4.00.
(Previously announced in STAR as N82-13146)

A82-35390 # HC and CO emission abatement via selective fuel injection. D. W. Bahr (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-178.* 9 p. 5 refs. Members, $2.00; nonmembers, $4.00.

The results of investigations to develop carbon monoxide (CO) and unburned hydrocarbons (HC) abatement methods for use in aircraft turbofan engines are reviewed. Specifically, the use of selective fuel injection patterns at ground idle operating conditions in CF6 engines was assessed and evolved in combustor and engine tests. These fueling patterns were obtained by valving fuel to selected combinations of fuel nozzles at idle, rather than to the full complement of engine fuel nozzles, and were intended to provide localized fuel-air ratio enrichment within the combustor annulus. In addition to the effects of such fueling patterns on HC and CO levels, their effects on engine performance at starting, sub-idle, and idle conditions were determined. The use of repetitive clusters of fueled nozzles around the combustor annulus was determined to provide the best overall emission abatement, performance, and operational characteristics. (Author)

A82-35391 # Status report of the USAF's Engine Model Derivative Program. M. S. Coalson (USAF, Wright-Patterson AFB, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-183.* 9 p. Members, $2.00; nonmembers, $4.00.

An investment strategy, known as the Engine Model Derivative Program has resulted in the prototype development of a new fighter engine, a new turboprop engine, and promises the future development of a second fighter engine. The rationale for prototype, rather than full-scale development is presented and a brief overview of the F101 derivative fighter engine, XT56-100 and F100 advanced derivative is described. (Author)

A82-35392 # Demonstration of ceramic hot-section static components in a radial flow turbine. J. P. Arnold, W. McGovern (U.S. Army, Mobility Equipment Research and Development Command, Fort Belvoir, VA), J. C. Napier, and A. P. Batakis (Solar Turbines, Inc., San Diego, CA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-184.* 6 p. 9 refs. Members, $2.00; nonmembers, $4.00. Army-sponsored research.

Ceramic hot-section turbine components allow higher temperature for up-rated power and improved fuel economy. The methodology used in arriving at a successful 200-hr engine demonstration of an all ceramic nozzle is presented along with current progress in demonstrating the remaining ceramic hot-section static components. (Author)

A82-35394 # A stage-by-stage dual-spool compression system modeling technique. M. W. Davis, Jr. (Sverdrup Technology, Inc., Arnold Air Force Station, TN). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-189.* 11 p. 16 refs. Members, $2.00; nonmembers, $4.00.

Mathematical compressor models are major tools used in resolving engine problems and evaluating the influence of compressor modifications on performance and stability. This paper discusses the development of a one-dimensional, time-dependent, dual-spool, stage-by-stage compression system mathematical model and its application to a current compression system. The dual-spool model was constructed by extending a current single-spool modeling technique to include dual-spool compression systems. To improve the numerical stability characteristics of the compressor modeling technique, the dual-spool model was formulated using MacCormack's (1969) explicit differencing scheme and a method of characteristics boundary treatment. The dual-spool model was applied to a current compression system, and several types of planar destabilizing disturbances were studied to determine their effect on compression system stability. Model predictions were validated against experimental data whenever possible. (Author)

A82-35396 # TURBOTRANS - A programming language for the performance simulation of arbitrary gas turbine engines with arbitrary control systems. J. R. Palmer (Cranfield Institute of Technology, Cranfield, Beds., England) and C.-Z. Yan (Shenyang Aeroengine Research Institute, Shenyang, People's Republic of China). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-200.* 8 p. 8 refs. Members, $2.00; nonmembers, $4.00.

TURBOTRANS is a new computer program, written in FORTRAN IV and implemented on various computers, which satisfies the requirements of flexibility, accuracy, ease of use, and suitability. The component performance, steady-state performance simulation, and transient performance simulation are analyzed. The configuration of the gas turbine engine and control system can be described in the program by using codewords corresponding to the various components and processes of both engine and control systems. A flow diagram of TURBOTRANS and a brief description of the function of each main subroutine are given. Illustrations of the program's capabilities are presented. C.D.

A82-35398 # Aeropropulsion research for the U.S. Army. R. E. Singleton (U.S. Army, Research Office, Research Triangle Park, NC). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-203.* 11 p. 20 refs. Members, $2.00; nonmembers, $4.00.

Examples are presented of U.S. Army-supported research in aeropropulsion static and rotating component design and manufacture, with emphasis on anticipated improvements in engine reliability, life cycle costs, and fuel consumption. The investigations extend to centrifugal flow compressor rotors and variable area nozzles, counterflow film-cooled combustors, felt-ceramic liner annular combustor concept development, turbine blade thermal barrier coatings, gear tooth dynamics, turbine seals, such advanced ceramics as silicon nitride, and polyimide composite fan blades. O.C.

A82-35400 # Adaptive fuel control feasibility investigation for helicopter applications. T. Morrison, R. D. Zagranski (Chandler Evans, Inc., West Hartford, CT), and J. J. Howlett (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-205.* 11 p. Members, $2.00; nonmembers, $4.00.

A United States Army-sponsored, computer-aided study of a twin engine helicopter is being conducted to determine the feasibility of incorporating into the engine microprocessor-based control system, airframe signals and control strategies that improve helicopter capability. Investigations are considering online changes to the control characteristics which adapt to abnormal engine operation due, for example, to engine deterioration, surge or failure. The anticipation of power recovery from a split needle condition is accomplished with rotor speed feedback, which allows increased transient load factors and improved handling qualities in maneuvering flight. An improvement in torsional damping is achieved with software filters which reduce the dependence of the drive train stability on the blade lag dampers. (Author)

A82-35401 # Local heat transfer to staggered arrays of impinging circular air jets. A. I. Behbahani and R. J. Goldstein (Minnesota, University, Minneapolis, MN). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-211.* 7 p. 16 refs. Members, $2.00; nonmembers, $4.00.

Measurements are made of the local heat transfer from a flat plate to impinging arrays of staggered circular air jets. Fluid from the spent jets is constrained to flow out in one direction. Two different jet-to-jet spacings, 4 and 8 jet diameters, are employed. The parameters that are varied include jet-orifice-plate to impingement-surface spacing and jet Reynolds number. Local heat transfer coefficients vary periodically both in the flow direction and across the span with high values occurring at stagnation regions. Stagnation regions of individual jets as determined by local heat transfer coefficients move further in the downstream direction as the amount of crossflow due to upstream jet air increases. Local heat transfer coefficients are averaged numerically to obtain spanwise and streamwise-spanwise averaged heat transfer coefficients. (Author)

A82-35402 # Acquisition of F-100/3/ high pressure compressor entrance profiles. D. C. Rabe, W. W. Copenhaver, and M. S. Perry (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-215.* 5 p. 6 refs. Members, $2.00; nonmembers, $4.00.

A transportable automatic data acquisition system to obtain high pressure compressor entrance profiles in an F-100 Series 3 gas turbine engine is described. The system was developed, assembled, and tested at Wright-Patterson Air Force Base and transported to a remote location for implementation in a sea level engine test. Acquisition of data was controlled through a Hewlett Packard Model 9825T desktop calculator, preprogrammed to display airflow data in engineering units during the test. Entrance profiles of total and static pressure, temperature, and flow angle for two axial locations are presented. A wedge probe sensing element was positioned at 12 radial locations by remote traversing mechanisms to obtain these profiles. For a total pressure range of 18 to 46 psia (0.13 to 0.32 MPa), acquisition uncertainties in static and total pressure were reduced to below + or - percent of measured values by optimizing data system component uncertainties. (Author)

A82-35404 # Advanced turboprop engines for long endurance naval patrol aircraft. R. Hirschkron and R. H. Davis (General Electric Co., Aircraft Engine Business Group, Lynn, MA). *American Society of Mechanical Engineers, International Gas Turbine Conference and Exhibit, 27th, London, England, Apr. 18-22, 1982, Paper 82-GT-217.* 7 p. Members, $2.00; nonmembers, $4.00. Navy-sponsored research.

Long endurance naval patrol aircraft of the future will require more efficient advanced turboprop powerplants. Engines used in this kind of application will have performance requirements emphasizing prolonged endurance and very low specific fuel consumption for cruise and part-power loiter operation. Regeneracontrol system dynamics is used to give qualitative and quantitative guidance in the design process as well as to aid in analysis of experimental results. System performance in wind tunnel tests is described, and evidence is given of the system's ability to provide substantial additional damping to stall-induced blade oscillations. (Author)

A82-37766 # CFC drive shaft and GFC coupling for the tail rotor of the BO 105. C. M. Herkert, D. Braun, and K. Pfeifer (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 27 p.

A new tail rotor drive system using a carbon fiber composite shaft and glass fiber composite couplings is being designed for the BO 105 instead of the existing metal version with a view to reducing the mass and the cost of the drive system. The discussion covers general design requirements, analytical evaluation of several design concepts including bolted and bonded versions, manufacturing techniques, tool design, test results and cost effectiveness of the proposed designs. It is shown that the composite version of the tail rotor drive system would provide a 10% reduction in the manufacturing cost, a mass reduction of 4 kg for the long shaft and 1 kg for the short shaft, and, possibly, a reduction in the number of parts. V.L.

A82-37767 # Quantification of helicopter vibration ride qualities. C. E. Hammond and D. D. Hollenbaugh (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 14 p. 8 refs.

Absorbed power, a measure of the rate at which the body absorbs energy when subjected to vibration (as developed by the U.S. Army TACOM), is used as a means for quantifying helicopter vibration ride quality. Vibration tests, performed on pilots of five different operational U.S. Army helicopters are converted to absorbed power using calculations derived for quantitative measures of ride quality for ground vehicles. The results are compared to previously obtained data showing acceptable subjective response for helicopter vibration levels and ISO 2631 reduced proficiency boundaries (both converted to absorbed power). Absorbed power measurements from the operational helicopters are, in general, higher than the values from these comparative boundaries and fall between the levels for acceptable ride quality of automobiles and off-road vehicles (0.2-6 W). Further research using the NASA-Langley Research Center Passenger Ride Quality Apparatus, is planned. N.B.

A82-37768 # Practical application of a computerized flight by flight fatigue test system. A. Jorio and G. Parenti (Costruzioni Aeronautiche Giovanni Agusta S.p.A., Varese, Italy). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 17 p.

Requirements related to the procedure leading to the certification of a helicopter, and general developments concerning the state of the art provided the motivation for modernizing the equipment used in fatigue testing. The modernization made it possible to reduce the time required for testing, and to minimize needs for operator assistance during the test. It was also possible to improve accuracy and reliability. A flight test data survey is conducted, and flight by flight fatigue tests are discussed. A description of a computer controlled system is presented, taking into account the system definition, the software philosophy, the system architecture, and a system functional description. G.R.

A82-37769 # Quasi-static and dynamic crushing of energy absorbing materials and structural components with the aim of improving helicopter crashworthiness. C. Kindervater (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Stuttgart, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 26 p.

Energy absorbing tests are performed on several materials and structural components, such as aluminum honeycomb, thin-walled aluminum and steel cylinders, PUR-foam cylinders, and fiber-reinforced cylindrical tubes, with the eventual goal of improving helicopter crashworthiness. Axial crushing tests, under quasi-static and impact loading, are conducted to determine several key energy absorbing parameters for these materials and structures, including specific energy, energy dissipation density, stroke efficiency and operating stress. Fiber-reinforced tubes gave the best results, having a specific energy value of about twice the maximum observed for aluminum honeycomb and about six times the best value for foam-filled metal cylinders. Little difference is shown between the static and dynamic failure modes. Finally, a crash test structure is drop tested with some selected structural elements acting as energy absorbers and the results are compared to crash cases simulated using a computer program. The comparison tests showed that accurate estimations of the dynamic response of the total structural assembly can be obtained by using statically-determined load deflection characteristics of the absorbing elements. N.B.

A82-37770 # Joint Anglo-American experience of the analysis of helicopter rotor blade pressure distribution. D. J. Merkley (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA), M. J. Riley, and C. Young (Royal Aircraft Establishment, Farnborough, Hants., England). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 21 p. 8 refs.

NASA, the U.S. Army, and the Royal Aircraft Establishment (RAE), UK, are collaborating in a study to develop interactive computer systems for use in analyzing helicopter rotor blade pressure distribution measurements. Flight tests on AH-1G and Wessex helicopters provided data which were then analyzed using two different computer program systems. The RAE interactive graphics programs perform curve fitting and integration routines which enable force and moment coefficient plots to be visually displayed, and for regions of interest, such as where blade section limitations are apparent, to be located for the more detailed study of chordwise pressure distribution. The U.S. team incorporated and considerably extended the RAE programs into a computer software system called DATA-MAP, which offers the convenience of fully interactive graphics to display the pressure measurements in absolute values or coefficient form against time, chord or radius, to derive forces and moments, and to optimize scaling as the analysis proceeds. Examples of the plots obtained from both systems are included. Two joint workshops have been held to exchange information and to correlate the various data bases (test and analytic). Further cooperative efforts are planned. N.B.

A82-37771 # Ageing of composite rotor blades. F. Och (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 16 p. 6 refs.

Long term effects of the environment on composite rotor blades used in different climatic zones are evaluated by means of coupon testing (sections cut out of blades) and tests of full-scale components. Blades with 2600, 3700 and 6100 flight hours, flown over the Gulf of Mexico and the North Sea region, show a reduction in interlaminar shear strength due to accelerated aging, but no weathering influence is found on bending strength. Artificial weathering of coupon specimens yields a significant reduction in the endurance limit of matrix controlled properties after sufficient time of exposure (500 hr). Full scale fatigue testing indicates that there is no adverse influence of service usage on composite rotor blades. In general, composite material fulfills its expected advantages, making it the best structural material for rotory wing applications. N.B.

A82-37772 # Helicopter design synthesis. O. R. Ramos and P. Taylor (Southampton, University, Southampton, England). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th. Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 22 p. 16 refs. Research supported by the Ministry of Defence (Procurement Executive).

A modular computer program is developed to aid the preliminary design analysis of the aerodynamic and dynamic characteristics for projected base-line helicopters of conventional configuration. The computer program, called HELISOTON, allows time-efficient assesament of the multi-variable relationships between the various input design requirements in the earliest stages of project definition. HELISOTON consists of an iteration procedure for automated prediction of a helicopter's AUW, installed power and size as a function of the aircraft role, specification and mission profile. When the basic iteration is linked to a series of outer iterative loops, the program then carries out simple optimization decisions related to the preliminary stages of design and can be used to simply select design parameters, ruling out those solutions that cannot be expected to lead to efficient or practical final base-line designs. HELISOTON can also be used for data generation in conjunction with external optimization programs covering fields wider than aerodynamics and dynamics and/or using more detailed, time-consuming computational models. Sample program results are included to illustrate the potentialities of the program and the several modes in which the program can be advantageously operated. N.B.

A82-37773 # Factors shaping conceptual design of rotary-wing aircraft. W. Z. Stepniewski. *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 18 p. 10 refs.

The investigation is mainly concerned with the most important design parameter value trends as exhibited by the foremost design schools represented by the Soviet Union and the Western nations. In addition to pure helicopters of various configurations, a few new rotary-wing concepts as the tilt rotor, ABC, and the X-wing are considered so that their competitive positions with respect to classical helicopters can be assessed. A number of Soviet helicopters listed in a table include, in addition to examples of traditional Soviet design philosophy, also the Mi-24 and Mi-26 as examples of the new Soviet design philosophy adopted by the Tishchenko design team. The Western rotorcraft selected for the comparative study include single-rotor and tandem helicopters ranging in maximum gross weights from about 5000 to almost 150,000 pounds. The state of the art of powerplants is examined, taking into account Western and Soviet engines. Attention is given to disk loading, power loading, tip speed, advancing blade-tip Mach number and advance ratio barrier, and weight and energy aspects. G.R.

A82-37775 # **An automatic map reader suitable for use in helicopters.** G. F. Walker (Marconi Avionics, Ltd., Rochester, Kent, England). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmish-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 11 p. 6 refs.

The automatic map reader (AMR) is a portable, hand-held navigation device designed to greatly increase navigational accuracy in tactical helicopters, particularly in the Nap-of-the-Earth flight environment. The AMR incorporates several features which make it attractive for use in helicopters, including the use of unprepared standard maps, the unlimited orientation of the map, low weight, and low cost. The interface unit of the AMR converts data from the navigational computer into a form suitable for use by the display head, which contains two discs, drive mechanisms, display and processor electronics, and the system operational controls. Flight position is indicated by the intersection of lines engraved on two separately movable circular discs. Flight evaluation tests demonstrated the effectiveness of the AMR in terms of performance and cost at an overall weight and size suitable for helicopter use. N.B.

A82-37776 # **Optimization of blade pitch angle for higher harmonic rotor control.** H. G. Jacob (Braunschweig, Technische Universität, Brunswick, West Germany) and G. Lehmann (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Flugmechanik, Braunschweig, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmish-Partenkirchen, West Germany, Sept. 8-11, 1981, Paper.* 29 p. 7 refs.

An achievement of improved harmonic control in the case of helicopter rotors makes it possible to reduce oscilatory hub forces and moments, decrease blade stresses, increase performance, and avoid instabilities of blade motion. The present investigation is concerned with numerical studies which have been conducted to enhance the harmonic control of helicopter rotor blades. Three different mathematical models are employed to show the effectiveness of improved harmonic blade control and to provide an overview concerning the sensitivity of the control inputs. An optimization method is discussed, and the time dependent optimal control of the blade pitch angle is considered. Attention is given to the mathematical model of a rotor with rigid blades and flap hinges, and a mathematical model of a rotor system with elastic blades. G.R.

A82-37777 * **General purpose research rotor.** R. Jones, H. E. Howes (Kaman Aerospace Corp., Bloomfield, CT), and L. A. Haslim (NASA, Ames Research Center, Moffett Field, CA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-9.* 15 p.

An analytical study, under a NASA contract, is performed on an advanced flight research rotor (four-bladed, 54 ft in diameter, with bearingless rotor retention characteristics) to determine the sensitivity of total rotor characteristics such as vibratory hub loads, rotor horsepower, and blade loads, to parametric variability of the rotor configuration. The sensitivity of the rotor to various combinations of blade planform taper, percent of blade span that is tapered, tip sweep angle, built-in-twist, and torsional frequency is determined for specific configurations by randomly selecting combinations of these parameters. Characteristics of other intermediate rotor configurations are determined by a regression analysis. The results show that a wide range of rotor total performance characteristics can be obtained for a rotor trimmed to the same flight conditions. The regression equations predict total performance of the rotor very well and appear to be a useful analytical tool for rotor design optimization. Figures showing the results of the various tests are given along with a table of the regression coefficients. N.B.

A82-37778 **Low vibration design of AAH for mission proficiency requirements.** B. P. Gupta and E. R. Wood (Hughes Helicopters, Inc., Culver City, CA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-2.* 9 p. 11 refs.

The Army Advanced Attack Helicopter (AAH) considered in the investigation has a four-bladed fully articulated rotor which turns at 289 RPM. The aircraft basic design gross weight is 14,660 lbs. The two-men crew includes a pilot and a copilot gunner. AAH design features for low vibration are considered, taking into account also a program to reduce even further the low vibration levels in the basic aircraft. A flight spectrum approach to helicopter vibration specifications is discussed, giving attention to helicopter vibrations and airspeed, Miner's rule applied to helicopter vibrations, the primary mission profile for the AAH, and a typical structural component S-N curve. The criterion of 'hours before proficiency degrades' relates the complex crew vibration environment to a single quantity which is physically significant. G.R.

A82-37779 **Army helicopter crew seat vibration - Past performance, future requirements.** S. T. Crews and W. W. Hamilton (U.S. Army, Qualifications Directorate, St. Louis, MO). *American Helicopter Society, Northeast Regional National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-3.* 8 p. 12 refs.

The Army is interested in setting vibration specifications as a means to insure that pilot, copilot, and crew are able to perform whatever tasks they have to accomplish to make their mission a success. Mission tasks vary in different flight regimes and for different missions. The level of vibration which will interfere with task performance will vary consequently with flight regime and mission, and, correspondingly, the vibration specifications should vary also. Investigations related to an establishment of suitable vibration specifications for Army helicopters are discussed, taking into account ride quality research, the intrusion index, flight test results, and Army ride quality specifications. The results of the study show that the Army has achieved marginally acceptable vibration related ride quality on its operational helicopters. G.R.

A82-37780 **The Helicopter Ride Revolution.** R. W. Balke (Bell Helicopter Textron, Fort Worth, TX). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-4.* 15 p. 33 refs.

It is pointed out that the Helicopter Ride Revolution began in earnest with the stringent requirements of a draft in 1971. It will conclude with the achievement by the helicopter industry of a jet-smooth ride by the end of the century. The major technological milestones which must be met to achieve this goal on schedule are developed through an evaluation of the interdependence of design and analytical techniques and the duration of a typical system-acquisition cycle. The 30 years between the first impetus in 1971 and the year 2000, when the first helicopters with a jet-smooth ride are scheduled for completion, can be characterized by three 10-year periods, including the reactive era, the technological development era, and the application or maturity era. For the achievement of a jet-smooth ride it will be necessary that the vibration levels, along all axes and across the frequency band, be equivalent to those of a typical jetliner. In addition, all other factors affecting the sensory perceptions must also be equivalent. G.R.

A82-37781 **Improved methods in ground vibration testing.** E. J. Nagy (Kaman Aerospace Corp., Bloomfield, CT). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-6.* 10 p.

Methods and procedures developed during ground vibration testing of an Army AH-1G helicopter airframe, which improve the validity of the test results and establish certain ground rules for the performance of this type of testing, are described. The optimum excitation technique is found to be the logarithmic swept sinusoidal testing after the initial locations of modal natural frequencies are found with the random excitation technique. Forcing levels need to be increased to levels unheard of in the industry (at least 300 lb) in order to reach the true linear range of the airframe. Various sources of error are identified, including the high frequency residual (local mode) effect which may or may not appear at the various driving points of the structure. The use of the autospectra, the coherence function, the transfer function, and the input and output signals displayed on a dual-channel oscilloscope are means of verification that good mobility spectra will be available for determination of the global parameters. N.B.

A82-37782 **Determination of in-flight helicopter loads and vibration.** N. Giansante, R. Jones (Kaman Aerospace Corp., Bloomfield, CT), and N. J. Calapodas (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for the Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Preprint 81-7.* 8 p.

It is pointed out that the helicopter industry has generally experienced difficulty in making analytical predictions of airframe vibrations. A number of approaches have been developed in an attempt to solve the problems of helicopter vibratory response prediction. The present investigation had the objective to explore merits and suitability of these approaches. One technique, called Force Determination methodology, was found to make it possible to determine successfully the magnitudes and phase angles of vibratory forces acting on AH-1G airframe. The 'Automated Dynamic Analytical Model Improvement Technique' could be implemented

COMPARISON OF EXPERIMENTAL AND ANALYTICAL PERFORMANCE FOR CONTOURED ENDWALL STATORS

Robert J. Boyle and Jeffrey E. Haas (Army Aviation Research and Development Command, Cleveland) 1982 15 p refs Presented at Eighteenth Joint Propulsion Conf., Cleveland, 21-23 Jun. 1982; sponsored by AIAA, SAE and ASME
(NASA-TM-82877; NAS 1.15:82877; AVRADCOM-TR-82-C-12) Avail: NTIS HC A02/MF A01 CSCL 21E

Comparisons between predicted and experimental stator losses showed that the analysis was able to predict the change in stator loss when contoured endwalls with highly three dimensional passage geometry were used. The level of loss was predicted to within 75 percent of that measured. The predicted loss was due only to profile loss and boundary layer growth on the endwalls. The 25 percent difference was approximately 0.015 at design pressure ratio. The analysis was shown to predict the trend in stator flow angle, even for small stator geometries. Author

EFFECT ON FUEL EFFICIENCY OF PARAMETER VARIATIONS IN THE COST FUNCTION FOR MULTIVARIABLE CONTROL OF A TURBOFAN ENGINE M.S. Thesis

Barry Lawrence Dougherty Sep. 1981 106 p refs
(AD-A110614) Avail: NTIS HC A06/MF A01 CSCL 21/5

In modern turbofan engines, variable geometry has been incorporated to improve some off-design performance. Most control designs ignore this variable geometry and use fuel metering as the primary control input. This thesis investigates the use of variable geometry to control the engine and, thereby, reduce fuel consumption due to transients. Additionally, steady-state trim conditions are altered to reduce the static fuel consumption. The non-linear transient simulation program is used to analyze the steady-state operating condition and develop small perturbation control limitations. Linear models, both large and reduced order, are used in analyzing the effect of controllers on system response. A computer program was generated to reduce a large order linear model to a usable size for control system development. This analysis shows the reduced-order regime dependent controllers to be viable and to favorably enhance the quest for reducing specific fuel consumption in existing engines. Author (GRA)

PERFORMANCE OF MULTIPLE, ANGLED NOZZLES WITH SHORT MIXING STACK EDUCTOR SYSTEMS M.S. Thesis

Charles Carver Davis Sep. 1981 435 p refs
(AD-A110817) Avail: NTIS HC A19/MF A01 CSCL 21/5

Cold flow tests were conducted on a four-nozzle gas eductor system to evaluate the feasibility of reducing mixing stack lengths by the application of angled primary flow nozzles. Three short mixing stacks with length to diameter ratios of 1.75, 1.5, and 1.25 were tested using a set of straight nozzles and a series of angled nozzles having tilt angles of 10, 15, 20 and 22.5 degrees. The nozzles were constructed with an area of primary flow to area of mixing stack ratio of 2.5. Pumping coefficients, mixing stack pressure distributions, flow changes, exit velocity profiles, and back pressures were used to evaluate the various mixing stack length and angled nozzle combinations. COMBUSTION BEHAVIOR OF SOLID FUEL RAMJETS. VOLUME 2: EFFECTS OF FUEL PROPERTIES AND FUEL-AIR MIXING ON COMBUSTION EFFICIENCY Final Report

Aug. 1981 54 p refs
(AD-A110796; NPS67-81-011) Avail: NTIS HC A04/MF A01 CSCL 21/5

Fundamental SFRJ fuel properties were determined using a DTA and a gas chromatograph for both high and low heating rates. The performance of these fuels was then measured under various operating conditions and test geometries. Fuel properties were found to have some effect on the obtainable combustion efficiency but much larger effects could be induced by the flow conditions (induced mixing near the fuel surface, bypass air, etc.). AN EXPERIMENTAL STUDY OF RECTANGULAR AND CIRCULAR THRUST AUGMENTING EJECTORS M.S. Thesis

Gregory Unnever Dec. 1981 74 p refs
(AD-A111110; AFIT/GAE/AA/81D-31) Avail: NTIS HC A04/MF A01 CSCL 20/4

A short rectangular ejector and two circular ejectors were tested to determine the effects of primary nozzle configuration and geometry on thrust augmentation. The primary nozzle configurations consisted primarily of slot nozzles which injected fluid parallel to the diffuser walls and achieved Coanda type flow at the throat. Results of the rectangular ejector tests indicate that thin plates installed in the mixing chamber or the diffuser, increase mixing but decrease thrust augmentation. A continuous slot nozzle, modified to create four discrete jets at the inlet, improved mixing and thrust augmentation compared to the original design. Thrust augmentation ratio increased from 1.4 to 1.58. The circular ejector primary nozzles consisted of a continuous slot 'torus' nozzle and individual slot nozzles which could be symmetrically placed around the inlet periphery. A nozzle configuration using 16 slot nozzles on the periphery of the inlet face gave the best performance. A thrust augmentation ratio of 2.0 was achieved. GRA

MECHANICAL WEAR ASSESSMENT OF HELICOPTER ENGINES BY FERROGRAPHY Final Report

Charles P. Merhib, Samuel J. Acquaviva, and Robert W. Ladner Nov. 1981 24 p ref
(AD-A110772; AMMRC-TR-81-55) Avail: NTIS HC A02/MF A01 CSCL 21/5

Two Ferrography analyzers, an analytical or laboratory Ferrograph and an On-Line (quasi-real-time) Ferrograph, were evaluated. The analytical Ferrograph was found to be an effective supplement to the spectrometric oil analysis program (SOAP) since the Ferrograph analyzes particles in the range of 1 to over 100 microns while SOAP analyzes particles below 5 microns in size. Comments are also offered on a third analyzer, the Direct Reading (DR) Ferrograph. To evaluate the analytical Ferrograph, oil samples from helicopters at Fort Devens, Massachusetts, were analyzed. One transmission was found with excessive wear particles which was later verified by SOAP. The On-Line Ferrograph was tested in 410 hours of operation using a T53-L-13B helicopter engine in a test cell at the Corpus Christi Army Depot. After determining baseline data for the engine, defective bearings were substituted to enhance particle wear penetration. The particles subsequently generated were successfully detected by both the On-Line Ferrograph and SOAP. GRA

AERODYNAMICALLY INDUCED VIBRATION Interim Report, 1 Jun. 1980 - 31 Jul. 1981
Robert L. Jay and James L. Bettner Sep. 1981 128 p
(Contract F49620-80-C-0078; AF Proj. 2307)
(AD-A110493; DDA-EDR-10840) Avail: NTIS HC A07/MF A01 CSCL 21/5

An experimental investigation, performed in a large scale low-speed, single-stage compressor, was conducted to provide the radial and chordwise distribution of basic unsteady pressure data on the stator. Radial and circumferential distributions of streamwise and transverse velocity fluctuations were determined at stations upstream, inside and immediately downstream of the stator. Analysis of the results indicated a correlation of the normalized transverse fluctuation velocity component with stator incidence angle. The fluctuations were very large in the endwall regions and were attributed to poor flow conditions generated in the hub and tip endwall regions of the rotor. GRA

(AD-A111584; AFWAL-TR-81-2099) Avail: NTIS HC A06/MF A01 CSCL 21/5

This report summarizes the studies in heat transfer and film cooling effectiveness performed under Contract F33615-76-C-2018. The purpose of these experimental and theoretical studies is to develop an indepth understanding of heat transfer and film cooling in gas turbines. A common experimental procedure is described for heat transfer measurements under isothermal wall conditions using fast response heat transfer gauges in tests conducted in a shock tunnel and a blowdown facility. The tests were conducted at flow and thermodynamic conditions modeling the operating conditions of advanced gas turbines. The configuration under study were single slot, single line of holes, double row of holes on a flat and curved plates, and double lines on an airfoil located in a cascade. The experimental technique was validated by long duration high temperature tests of an air cooled flat plate. Also described is an analytical study of the thermal and fluid mechanical evolution of a cooling film injected from a single line of inclined holes. Author (GRA)

BLADE TIP GAP EFFECTS IN TURBOMACHINES: A REVIEW Final Report, 1 Oct. - 30 Sep. 1980
Roy E. Peacock Nov. 1981 103 p refs
(AD-A111892; NPS67-81-016) Avail: NTIS HC A06/MF A01 CSCL 21/5

A review is presented of experiments examining the effects of blade tip gaps encountered in turbomachines and the methods by which the synthesised data are currently used in turbomachinery design and performance analysis. Data gained since the 1930's is subdivided for convenience into diffusing, or compressor-type flows, and accelerating, or turbine-type flows. There is a further sub-division into cascade and rotating machinery data. The overall trend university is that an increasing tip gap whose effect can reach over most or all of the blade height brings reduced overall performance of a turbomachine. Turbine data are in general more regular than the body of compressor data, possibly due in part to the enhanced effect of, usually, undefined boundary layers in diffusing flow. There is some evidence among the compressor and compressor cascade data that an optimum gap exists when the opposing effects of secondary flows, and tip leakage with rotor/wall relative movement tend to balance. Comment is made upon the prediction and design models published in the literature. Author (GRA)

LIFE AND UTILIZATION CRITERIA IDENTIFICATION IN DESIGN (LUCID), VOLUME 2 Final Report, Aug. 1978 - Mar. 1981
J. G. Osmer and C. C. Dietrick Wright-Patterson AFB, Ohio AFWAL Oct. 1981 117 p refs 2 Vol.
(Contract F33615-78-C-2032; AF Proj. 3066)
(AD-A111940; AFWAL-TR-81-2101-Vol-2) Avail: NTIS HC A06/MF A01 CSCL 21/5

Procedures for predicting gas turbine engine usage are presented. Peacetime missions were defined for an advanced tactical strike aircraft and were employed by the usage models to generate a composite engine duty cycle. The engine duty cycle was analyzed and compared to engine usage projections for other advanced tactical aircraft. The analysis demonstrated significant variations in engine usage due to weapon delivery tactics associated with advanced air to surface missiles, as well as variations in peacetime mission frequencies and aircraft performance. CURRENT STATUS OF INLET FLOW PREDICTION METHODS
Gerald C. Paynter 14 May 1981 36 p refs
(AD-A111784) Avail: NTIS HC A03/MF A01 CSCL 21/5

The increasing availability of large computers, advances in numerical fluid mechanics, and the rapidly escalating cost of wind tunnel testing are responsible for a trend toward the use of parametric analysis rather than parametric testing to support the design of inlet systems. With an emphasis on the transonic and supersonic speed regimes, current approaches to inlet flow analysis are discussed in the context of the inlet design process. Results from typical procedures now under development for supersonic inlet flows are presented along with a discussion of the advantages and disadvantages of each for design. The requirements for experimental validation of a procedure and analysis problem areas are reviewed. Recent developments which may lead to an improved inlet flow analysis capability are discussed. TURBINE ENGINE LUBRICANT RECLAMATION Interim Report, 1 Sep. 1979 - 1 Feb. 1981
George L. Beemsterboer and Richard J. Bruns Wright-Patterson AFB, Ohio AFWAL Dec. 1981 132 p refs refs HC A06/MF A01
(Contract F33615-79-C-2052; AF Proj. 3048)
(AD-A112098; MRC-DA-1057; AFWAL-TR-81-2053) Avail: NTIS CSCL 11/8

A distillation and adsorption treatment for reclaiming used MIL-L-7808 turbine oils was investigated. A viable additive package was tested on different MIL-L-7808 type virgin base stocks. Fifteen used oils were analyzed by acid number, high performance liquid chromatography, and gas chromatography. A distillation process utilizing caustic (sodium hydroxide) pretreatment was developed on 500-ml and 13-litre scales. Adsorption treatment of distilled oils with calcium hydroxide followed by attapulgus clay was examined. Preparations for large-scale (25 and 250 gal) reclamations are currently under way to elucidate the validity of caustic distillation and absorbent treatment parameters. Author (GRA)

field are discussed. The procedure chosen combines the consistency of the Tscherning-Rapp model with the advantages of a formulation in terms of Gauss-Markov processes by making use of the essential parameters of a covariance function proposed by Moritz. The expressions for the gravity induced position errors resulting from this approach are easy to compute for a wide variety of cases. The assumptions made to derive them are in general justifiable. Based on the available gravity field information a number of approximation models are proposed and expressed in terms of equivalent spherical harmonic expansions. Results show that the use of presently available global models would reduce the gravity induced position errors from Sigma = 150 m. Improved global models expected in the near future as for instance those from the GRAVSAT mission, would bring errors below Sigma = 50 m. GRA

QUASILINEARIZATION SOLUTION OF THE PROPORTIONAL NAVIGATION PROBLEM
Dale W. Alspaugh (Purdue Univ., West Lafayette, Ind.) and Maurice M. Hallum, III Jun. 1981 24 p refs
(DA Proj. 1L1-62302-A-214)
(AD-A113668; AD-E950227; DRSMI/RD-81-15-TR) Avail: NTIS HC A02/MF A01 CSCL 17/7

An approximate solution is presented in this report for the trajectory of a constant-speed missile following a planar intercept trajectory based on proportional navigation guidance. The technique of quasilinearization is used to generate a sequence of solutions. An explicit solution is developed using the first recursive solution. The accuracy of this solution is discussed in the context of specific sets of parameters. It is shown that this explicit solution provides excellent accuracy over a wide range of intercept trajectories. Author (GRA)

DOPPLER TEST RESULTS OF EXPERIMENTAL GPS RECEIVER Final Report
Richard J. Anderle Jan. 1982 64 p refs
(AD-A113587; NSWC/TR-82-01) Avail: NTIS HC A04/MF A01 CSCL 08/5

Three experimental geodetic Global Positioning System Receivers were deployed in the Washington, D. C. area. Analysis of five to six hours of Doppler observations distributed among four satellites yielded relative position coordinates on a 28 km baseline which were repeatable to 30 cm in height, 70 cm in the East directions and to 10 cm in the North directions. Results obtained for a receiver equipped with an oscillator having poorer stability degraded to 50 cm to 1.5 meters. The results confirm simulations that Doppler observations made with the geodetic receiver under development will yield decimeter accuracy in relative position in one to three hours. Since the experimental receivers required about a minute to sequence between satellites, tests could not be performed to test cm precision in relative station positioning which can be obtained by comparing phase observations between satellites with receivers under development. AIRCRAFT NOISE REDUCTION
Richard E. Russell and J. M. Streckenbach 1981 15 p Presented at the Intern. Symp. on Transportation Noise, Pretoria, 21-23 Oct. 1981
Avail: NTIS HC A02/MF A01

A brief introduction of the Boeing commercial airliner family is followed by a discussion of the significant noise reduction accomplishments for turbine-powered aircraft from the 1950's to the 1980's, with projections of further benefits until the year 2000. Definition of the trades to be made between noise reduction and fuel economy, as well as technical problems yet unsolved, lead to a recognition that the greatest advances in aircraft noise reduction are past, and that significant research will be required in the future to lower noise floors that are presently inhibiting further progress. Emphasis is given to precautions that must be taken in the selection of meaningful fleet noise data to avoid costly and irreversible errors in airport and community planning. T.M.

XH-59A ABC TECHNOLOGY DEMONSTRATOR ALTITUDE EXPANSION AND OPERATIONAL TESTS Final Report, Aug. 1980 - Jun. 1981

A. J. Ruddell Dec. 1981 79 p refs
(Contract DAAK51-80-C-0021; DA Proj. 1L1-62209-AH-76)
(AD-A111114; SER-69072; USAAVRADCOM-TR-81-D-35)
Avail: NTIS HC A05/MF A01 CSCL 01/3

This report presents the results of two flight test programs conducted with the XH-59A Advancing Blade Concept demonstra- configuration, consisted of altitude and center-of-gravity envelope expansion testing. Test results verified the concept of ope expansion testing. Test results verified the concept of developing lift primarily on the advancing rotor blades to dramatically improve lift and speed potential. The XH-59A achieved a maximum speed of 263 knots true airspeed and demonstrated a service ceiling of 25,500 feet. The entire flight envelope was demonstrated without classical retreating blade stall. Rotor loads and stresses and rotor tip clearance followed predicted trends and were controllable. Limited center-of-gravity envelope expansion was accomplished. The second program consisted of operational tests conducted primarily in the nap-of-the-earth and contour flight environments, using both the auxiliary and helicopter propulsion modes. The compact ABC design and smaller rotor diameter enhanced operation in confined areas. Operational test results showed the ABC to be a viable alternative concept for future tactical aircraft. GRA

AVIATION MATERIEL COMBAT READY IN-COUNTRY (AMCRIC)

Herman M. Orrell, III Jun. 1981 58 p refs
(AD-A107451) Avail: NTIS HC A04/MF A01 CSCL 15/5

A previous study, titled Aviation Materiel Combat Ready In-Country (AMCRIC), was provided as a basis to develop a concept to preposition Army aircraft in US Army Europe. This study recognized that aircraft are not authorized as war reserve, and that no aircraft are currently included in POMCUS in Europe. To adequately reinforce NATO, some method had to be devised to allow Army aircraft to be immediately available to a deploying combat force. The project considered: (a) Methods available to accomplish prepositioning of Army helicopters and ancillary systems; (b) South Vietnam Army aviation experience in combat; (c) State-of-the-art storage methods by US Government, foreign governments, and commercial contractors; and (d) Major command interfaces within the US Army that will be required to establish a workable concept. The project results were that US Army has the capability to store helicopters for short periods using on-hand resources; and The Vice Chief of Staff, Army, approved a prepositioning concept developed which will store helicopters in USAREUR on a test bed basis using AH-1S helicopters. RESPONSE OF CLOUD MICROPHYSICAL INSTRUMENTS TO AIRCRAFT ICING CONDITIONS Interim Scientific Report

Morton Glass and Donald D. Grantham 6 Jul. 1981 56 p refs
(AF Proj. 6670)
(AD-A112317; AFGL-TR-81-0192; AFGL-ERP-747) Avail: NTIS HC A04/MF A01 CSCL 01/4

A series of passes on 6 December 1979 through multilayered-supercooled stratiform and stratocumulus clouds by the Air Force Geophysics Laboratory's instrumented C-130E cloud physics research aircraft is used to evaluate a Rosemount Ice Detector. The response of the detector to icing conditions is compared with measurements from a J-W liquid water content meter and the Knollenberg Axial Scattering Spectrometer Probe (ASSP). A procedure to adjust for zero drift of the J-W instrument is developed. Comparison of liquid water measurements from the J-W and from the ASSP indicate that these data are highly correlated and similar in magnitude. A procedure for extracting useful information from the Rosemount Ice detector has been developed. The icing conditions in the cloud systems studied are typical of the range of conditions in winter stratiform clouds. Liquid water (LWC) values of 0.3 g/cu m and median volume diameters of 15 micrometers were most frequently observed. The results of the analysis show that the Rosemount Ice Detector is a sensitive indicator of the fluctuations of liquid water in clouds with LWC not exceeding 0.8 g/cu m -3. Author (GRA)

REDUCED PERFORMANCE AND INCREASED COST WARRANT REASSESSMENT OF THE MULTIPLE STORES EJECTOR RACK

26 Mar. 1982 6 p refs
(AD-A112776; GAO/MASAD-82-26) Avail: NTIS HC A02/MF A01 CSCL 19/2

The Air Force plans to award a contract in June 1982 for the continued development of an aircraft bomb carrier known as the Multiple Stores Ejector Rack (MSER). The rack, in development since 1976, was intended for use by certain Navy aircraft as well as several aircraft operated by the Air Force. However, we have found that: service interest in a common bomb rack has dwindled and both the Air Force and the Navy are pursuing separate bomb rack developments; some MSER development goals may not be achieved; and other alternatives to MSER have not been fully evaluated; in addition, MSER's estimated development costs have tripled and average unit procurement costs could not be 14 times greater than the cost of the racks now in service; and the development period has more than doubled. The Air Force has basically reduced it MSER requirements to one aircraft, the F-16, and the Navy has all but pulled out of the program. Before authorizing further expenditure of funds for MSER, GAO recommends that the Air Force and Navy Secretaries be required to determine whether a common bomb rack is still needed, whether MSER will meet Air Force and Navy requirements, and whether it is cost effective. GRA

DEVELOPMENT OF LOW-ORDER MODEL OF AN X-WING AIRCRAFT BY SYSTEM IDENTIFICATION Final Report

James H. Vincent and John W. Bunnell Feb. 1982 103 p refs
(Contract N00014-79-C-0578)
(AD-A113760) Avail: NTIS HC A06/MF A01 CSCL 01/3

The original purpose of this contract was to prepare a flight test plan for the proposed X-wing demonstrator using system identification to extract useful math models from the flight test data. Since the original statement of work was submitted, however, the scope of this study changed. An X-wing program decision has been reached not to carry the Lockheed X-wing configuration to flight test. Therefore, this task was modified to provide a demonstration of the feasibility of using system identification techniques to extract low-order math models from time history data from a detailed X-wing rotor simulation (REXOR). B-747 VORTEX ALLEVIATION FLIGHT TESTS: GROUND-BASED SENSOR MEASUREMENTS Final Report

D. C. Burnham Jan. 1982 188 p refs
(AD-A113621; DOT-TSC-FAA-81-19; DOT/FAA/RD-81/99)
Avail: NTIS HC A09/MF A01 CSCL 20/4

In 1979, a series of B-747 flight tests were carried out to study the wake-vortex alleviation produced by deploying spoilers in the landing configuration. The alleviation achieved was examined by encounters of probe aircraft and by velocity profile measure- ments made by a ground-based Laser Doppler Velocimeter. For the first time these two types of measurements were analyzed in a way which allowed direct comparison; they showed reasonable agreement. The velocimeter measurements can be used to evaluate the vortex-induced rolling moment on any following aircraft at any separation. The spoiler alleviation was found to be insufficient to assure safe landings of small aircraft at reduced separation behind the B-747. The persistence of the alleviated vortices appears to be due to the wing-tip vortices which dominate the roll-up of the spoiler-alleviated wake. The addition of rapid roll inputs to the spoiler deployment produced much more effective alleviation, but at the expense of an unacceptable ride quality in the generating aircraft. Author (GRA)

COMPARISON OF DIFFERENT FIGHTER AIRCRAFT LOAD SPECTRA
Aake Magnusson 1982 16 p refs
(Contract F-INK-82223-77-001-21-001)
(FFA-TN-1982-02) Avail: NTIS HC A02/MF A01

Open hole specimens, made from 3 mm thick aluminum 7075-T6 [3627-48] clad sheet, were subjected to fighter aircraft load spectra. The influence on fatigue life of spectrum variations, e.g., severe negative maneuver loads, maximum load truncation and cycle omission was studied. Six load spectra, including fighter aircraft loading standard for fatigue evaluation (FALSTAFF) and a cycle truncated version of FALSTAFF, containing 9006 cycles per 200 flights, i.e., half the original number, were investigated. Severe negative maneuver loads as well as maximum load truncation reduce the fatigue life. Truncated FALSTAFF produces the same fatigue life as the original sequence. Author (ESA)

CORRECTING FOR TURBULENCE EFFECTS ON AVERAGE VELOCITY MEASUREMENTS MADE USING FIVE HOLE SPHERICAL PITOT TUBE PROBES
Robert D. Pierce Feb. 1982 32 p refs
(AD-A112573; DTNSRDC/CID-82/1) Avail: NTIS HC A03/MF A01 CSCL 14/2

A procedure has been developed for correcting five hole spherical pitot tube mean velocity measurements for errors caused by velocity fluctuations associated with turbulent flow. Velocity fluctuations are independently measured with hot film or hot wire anemometers. These data are then applied to expressions derived in this report to accomplish the necessary correction. This procedure applies to the case where the pitot tube responds to average pressure differentials and is not oriented to null the cross velocity components. For the special case of isotropic flow, the results derived in this report show that corrections are not required. Author (GRA)

TORSIONAL STIFFNESS ELEMENT BASED ON COBALT-SAMARIUM MAGNETS Final Report
Reiner Osthermayer Bonn Bundesministerium fuer Forschung und Technologie Dec. 1981 70 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-81-044; ISSN-0170-1339; Rept-4.1.0032) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 14,70

The feasibility of a strapdown turn and bank indicator with an electromagnetic torsional stiffness element based on cobalt samarium permanent magnets was investigated. Characterization of the suitability of this magnetic material in fulfilling design requirements was stressed. Theoretical fundamentals for the tailoring of magnetic heads were reviewed. Cobalt samarium disks were magnetized axially in such a way that over a range of 18 deg a linear relationship between magnetic induction and the axial deviation angle exists. With these magnets, electromagnetic torsional stiffness elements were built in which the torsion constant is adjustable by the current. Alternative torsional stiffness elements with constant magnetization, but specific profiling of the magnets as well as magnets in connection with a specific current were also studied on a model for dynamic applications. Results validate the mechanical torsional stiffness element design and confirm the magnetic properties of cobalt samarium. Author (ESA)

IMPACT OF ADVANCED AVIONICS AND MUNITIONS TECHNOLOGY ON GROUND ATTACK WEAPONS SYSTEMS IN NIGHT AND ADVERSE WEATHER CONDITIONS
Louis J. Urban *In* AGARD Impact of Advan. Avionics Technol. on Ground Attack Weapon Systems Feb. 1982 4 p (For primary document see N82-27293 18-06)
Avail: NTIS HC A07/MF A01

Worldwide environmental conditions that may be encountered by fighter pilots are reviewed as well as the capabilities of potential adversaries. Technology efforts and systems developed to improve capability to operate at night and under unfavorable weather conditions discussed include advanced medium range air-to-air missiles, the PAVE TACK system used on the F-4 and F-111 aircraft, and the low altitude navigation and targeting infrared system for night (LANTIRN) which assists the pilot of a single seat aircraft to fly under the weather in night and helps in acquiring targets and readying weapons for launch. To complement LANTIRN, high resolution synthetic aperture tactical radar and millimeter wave radars are under development to improve target recognition, resolution, and navigation. The precision location strike system, imaging infrared Maverick, combined effects bomblets, GATOR air delivered mines, and wide area antiarmor munitions are other developments summarized. A.R.H.

SOME POTENTIAL NOVEL APPROACHES TO THE AUTOMATIC AIRBORNE DETECTION AND IDENTIFICATION OF GROUND TARGETS
J. S. Williams *In* AGARD Impact of Advan. Avionics Technol. on Ground Attack Weapon Systems Feb. 1982 13 p refs

Avail: NTIS HC A07/MF A01
Basic sensor processing functions are examined in an effort to establish the type of operation to be conducted optically. If optical techniques are to be used in target detection and identification, interfaces must be minimized in order to reduce the size of the device used, improve reliability and inspectability, and conserve signal power during processing. Topics covered include receiving optics, optical signal decomposition, image preprocessing, display prepreparation, acquisition computation, and range and bearing. Coherent transform optics, holographic methods, optical feedback, real-time processing, and optical bistable devices are discussed as processing elements. Although optical signal processing has considerable potential in airborne target recognition, considerable research is needed in this capability is to be realized. There is a need to support this activity with adequate modelling of the perception capability of the human visual system if information is to properly displayed and then utilized. A.R.H.

A PLANNING SYSTEM FOR F-16 AIR-TO-SURFACE MISSIONS
P. J. M. Urlings, W. Loeve, and J. Batenburg (Royal Netherlands Air Force, Zeist) *In* AGARD Impact of Advan. Avionics Technol. on Ground Attack Weapon Systems Feb. 1982 6 p refs

Avail: NTIS HC A07/MF A01
Recently introduced into the Royal Netherlands Air Force, the F-16 aircraft is to be employed in both air-to-air and air-to-surface operations. Successful air-to-surface mission accomplishment is highly dependent on the avionics system capabilities as navigation, target acquisition, fire control, and weapons delivery. To make use of the full avionic potential, the set-up of its systems requires careful planning and preflight preparation. Checklists must also be prepared for navigation and in-flight system operation. A concept for a mission planning system is presented to provide the F-16 pilot with a tool for performing adequate preparation. Specific F-16 avionic demands on mission planning are summarized and two systems related to this planning are described. The assembling of F-16 in-flight essentials into a combat mission folder is described. A.R.H.

PAVE MOVER AIDED INTEGRATED STRIKE AVIONICS SYSTEM
A. J. Mendez, T. A. DuPuis (AFWAL), and J. Boaz *In* AGARD Impact of Advan. Avionics Technol. on Ground Attack Weapon Systems Feb. 1982 6 p refs

Avail: NTIS HC A07/MF A01
Methods were developed for specifying targeting sensor performance based on tactics and weapons characteristics alone. Targeting sensor specifications (demand curves) developed in this manner indicate that, for quick reaction, short range attack with precision-guided munitions, single sensors do not generate sufficient confidence (supply curves) to satisfy the required timeliness. This problem is alleviated by treating all sensors as an integrated set - the ISAS concept. New tactics produce sudden encounters which do not always yield a favorable attack geometry, even if the ISAS is able to distinguish the high priority targets in its field of regard. This situation is greatly improved by real-time targeting data from a stand off target acquisition/control system such as Pave Mover. Maximum benefit from the new tactics and weapon delivery concepts is accrued by pairing the complementary capabilities of ISAS and Pave Mover. This combination optimizes the strike effectiveness and survivability of ground attack aircraft which must penetrate to the battlefield and deep interdiction regions. A.R.H.

ADAPTIVE MULTIFUNCTION SENSOR CONCEPT FOR AIR-GROUND MISSIONS
R. P. Mills-Goodlet, D. J. R. Stock, E. G. Woelfle, and C. Hamilton *In* AGARD Impact of Advan. Avionics Technol. on Ground Attack Weapon Systems Feb. 1982 15 p refs

Avail: NTIS HC A07/MF A01
The requirements imposed on a radar system it is to be installed in aircraft flying low-level interdiction missions are discussed. A typical low low-level air-ground attack scenario is described together with the various radar techniques and modes that must be employed. Particular attention is given to the nose radar, its antenna, and its integration with other aircraft sensors to form an adaptive multisensor system. The ways in which such a multisensor system can reduce pilot workload are examined. A.R.H.

ATTACK AND EN ROUTE AVIONICS FOR IN-WEATHER OPERATIONS
E. B. Beggs, W. F. Ball (Naval Weapons Center, China Lake, Calif.), and N. J. Schneider (Naval Weapons Center, China Lake, Calif.) *In* AGARD Impact of Advan. Avionics Technol. on Ground Attack Weapon Systems Feb. 1982 11 p

Avail: NTIS HC A07/MF A01
An increasingly sophisticated and lethal ground threat environment must be countered in large part by technological advances in the avionics of naval attack aircraft. Critical deficiencies exist in the areas of standoff targeting and weapon delivery, defense suppression, equipment reliability, and crew loading. To reduce pilot workload, automated procedures and decision aids must be developed. Technology must be made available for precise navigation, integration of weapon delivery and flight control systems, automatic target recognition, detection avoidance, automatic flight path routing, and secure communications. The ingress and egress phases of naval air missions are discussed as well as the attack phase and defense suppression. Author

WEAPON SYSTEM OF A FUTURE ATTACK AIRCRAFT [SYSTEME D'ARME D'UN AVION D'ATTAQUE FUTUR]
B. E. Bortomb *In* AGARD Impact of Advan. Avionics Technol. on Ground Attack Weapon Systems Feb. 1982 11 p refs In FRENCH
Avail: NTIS HC A07/MF A01
A hypothetical all-weather air-to-surface weapon system is presented which is adaptable to a single seat aircraft whose weight without armor would be on the order of 4 tons. It would appear that this system requires a precise predesignation of objectives, so that it can than fulfill its mission with good chances of success by day as well as by night; through diverse fogs and relatively important precipitation, conditions which cover 99% of the cases in which it is used. Transl. by A.R.H.

ADVANCED TECHNOLOGY AND FIGHTER COCKPIT DESIGN: WHICH DRIVES WHICH?
I. E. Schofield *In* AGARD Impact of Advan. Avionics Technol. on Ground Attack Weapon Systems Feb. 1982 10 p

Avail: NTIS HC A07/MF A01
Problems experienced by the ground attack fighter pilot are reviewed, and the design of an acceptable man machine interface in the cockpit in order to ensure maximum head up operation for low level flying is discussed. The present use of automation and CRT displays is reviewed. Problems in the employment of increased automation, direct voice input, and synthetic speech, and their integration into the avionics system are considered. The use of multifunction displays and controls, keyboards, and the more traditional switchery is discussed. J.D.

ADVANCED TARGET ACQUISITION AND TRACKING CONCEPTS FOR REAL TIME APPLICATIONS
John Thomas Hall *In* AGARD Impact of Advan. Avionics Technol. on Ground Attack Weapon Systems Feb. 1982 7 p refs

Avail: NTIS HC A07/MF A01

The basic functional requirements for the target acquisition mission based on the sensor input, preprocessing, image segmentation, feature extraction, target detection, and target classification operations are presented. The impact on designing real time tracking algorithms to follow targets through clutter is considered. An advanced tracking concept considering the coupling of the target detection/classification algorithm with the multimode track is discussed. The thrust for multisensor systems is considered from the synergistic target acquisition point of view. The implementation of smart sensor target acquisition functions is presently limited by hardware capabilities. The advancement in the very high speed dedicated integrated circuit technology will make present advanced algorithms realizable in integrated circuit hardware. The projected needs for real time target acquisition and tracking are considered for the autonomous vehicle. Several approaches are considered for realization of the truly real time target acquisition system in the next decade. J.D.

PERFORMANCE DETERIORATION DUE TO ACCEPTANCE TESTING AND FLIGHT LOADS; JT90 JET ENGINE DIAGNOSTIC PROGRAM
W. J. Olsson 22 Jan. 1982 147 p refs
(Contract NAS3-20632)
(NASA-CR-165572; NAS 1.26:165572; PWA-5512-87) Avail: NTIS HC A07/MF A01 CSCL 21E

The results of a flight loads test of the JT9D-7 engine are presented. The goals of this test program were to: measure aerodynamic and inertia loads on the engine during flight, explore the effects of airplane gross weight and typical maneuvers on these flight loads, simultaneously measure the changes in engine running clearances and performance resulting from the maneuvers, make refinements of engine performance deterioration prediction models based on analytical results of the tests, and make recommendations to improve propulsion system performance retention. The test program included a typical production airplane acceptance test plus additional flights and maneuvers to encompass the range of flight loads in revenue service. The test results indicated that aerodynamic loads, primarily at take-off, were the major cause of rub-indicated that aerodynamic loads, primarily at take-off, were the major cause of rub-induced deterioration in the cold section of the engine Differential thermal expansion between rotating and static parts plus aerodynamic loads combined to cause blade-to-seal rubs in the turbine. B.W.

CORE COMPRESSOR EXIT STAGE STUDY, VOLUME 6 Final Report, Oct. 1976 - Dec. 1981
D. C. Wisler Dec. 1981 97 p refs
(Contract NAS3-20070)
(NASA-CR-165554; NAS 1.26:165554; GE-R81AEG288) Avail: NTIS HC A05/MF A01 CSCL 21E

Rear stage blading designs that have lower losses in their endwall boundary layer regions were studied. A baseline Stage A was designed as a low-speed model of stage 7 of a 10-stage compressor. Candidate rotors and stators were designed which have the potential of reducing endwall losses relative to the baseline. Rotor B uses a type of meanline in the tip region that unloads the leading edge and loads the trailing edge relative to the baseline rotor A designs. Rotor C incorporates a more skewed (hub strong) radial distribution of total pressure and smoother distribution of static pressure on the rotor tip than those of rotor B. Candidate stator B embodies twist gradients in the endwall region. Stator C embodies airfoil sections near the endwalls that have reduced trailing edge loading relative to stator A. The baseline and candidate bladings were tested using four identical stages to produce a true multistage environment. Single-stage tests were also conducted. The test data were analyzed and performances were compared. Several of the candidate configurations showed a performance improvement relative to the baseline. A.R.H.

QCSEE UNDER-THE-WING ENGINE ACOUSTIC DATA
Harry E. Bloomer and Nick E. Samanich May 1982 28 p refs
(NASA-TM-82691; E-972; NAS 1.15:82691) Avail: NTIS HC A03/MF A01 CSCL 21E

Both an over-the-wing (OTW) and an under-the-wing (UTW) experimental engine are discussed. The UTW engine had a variable-geometry fan exhaust nozzle and a variable-pitch fan that provided quick-response reverse thrust capability. An automatic digital control enabled optimal engine operation under all steady-state conditions as well as during forward and reverse thrust transient operation. The engine was tested at the Engine Noise Test Facility alone and with wind and flap segments to simulate an installation on a short-haul transport aircraft. The engine acoustic configuration was varied to give 14 test configurations. All of the acoustic test results from the UTW program at Lewis are presented as 1/3-octave-band sound pressure level (SPL) tabulations for all of the test points and some narrow-band spectra and 1/3-octave-band data plots for selected conditions. FOREIGN OBJECT IMPACT DESIGN CRITERIA, VOLUME 2 Interim Technical Report, 31 Dec. 1977 - 31 Dec. 1978
Albert F. Storace Wright-Patterson AFB, Ohio AFAPL Feb. 1982 73 p refs
(Contract F33615-77-C-5221; AF Proj. 3066)
(AD-A112701; R78AEG180-Vol-2; AFAPL-TR-78-81-Vol-2)
Avail: NTIS HC A04/MF A01 CSCL 21/5

The program objective is to establish specific design criteria and provide the analytical design tools to assess and improve the foreign object damage tolerance of turbine engine fan and compressor blading. This program will aid in the design of more efficient damage-tolerant blading through the replacement of trial and error .FOD test and evaluation practices with systematic transient structural analysis methods, test procedures and design criteria. A design system structure was completed and initial versions of the preliminary and final design transient structural response computer programs were developed. In addition, the interface between the bird loading model and the final design response model was completed. Three first stage blades were selected for modeling and testing. Tests and analyses to be used to generate local and gross structural damage design data are in progress and planning was completed for structural element impact tests. Composite and metallic specimens for local and gross damage testing were designed and most of these specimens have been fabricated. A parametric matrix to guide the analyses and validation testing was completed and FOD design criteria goals were formulated for consideration in the program. Author (GRA)

FOREIGN OBJECT IMPACT DESIGN CRITERIA, VOLUME 3 Interim Technical Report, 31 Dec. 1978 - 31 Dec. 1979
Albert F. Storace Wright-Patterson AFB, Ohio AFAPL Feb. 1982 134 p refs
(Contract F33615-77-C-5221; AF Proj. 3066)
(AD-A112447; AFAPL-TR-78-81-Vol-3) Avail: NTIS HC A03/MF A01 CSCL 21/5

Specific design criteria were established and the analytical design tools were provided to assess and improve the foreign object damage (FOD) tolerance of turbine engine fan and compressor blading. Efficient, damage tolerant blading is designed by replacing trial and error FOD test and evaluation practices with systematic transient structural analysis methods, test procedures, and design criteria. A design structure was developed for the purposes of providing a consistent framework in which to constitute the design criteria, guiding the overall technical effort, and formulating a data foundation to define the problem environment. The transient-structural-response and interactive-loading models were developed. Local and structural impact testing, material property determination, error band analysis, and the formulation of design criteria were addressed. The properties for the metallic materials were established, and testing is underway to establish the properties for the composite materials. GRA

THE SCHLADITZ FUEL INJECTOR: AN INITIAL PERFORMANCE EVALUATION WITHOUT BURNING Final Report, 1 Sep. 1977 - 28 Feb. 1979
G. B. Matthews, J. E. Scott, K. A. Harvey, Jr., and J. Z. Colt, Jr. Mar. 1982 96 p refs
(Contract N00014-77-C-0684)
(AD-A113612; UVA/525335/MAE79/101R) Avail: NTIS HC A05/MF A01 CSCL 21/5

The Schladitz Fuel Injector (SFI) is a network of electrically heated, extremely thin metal whiskers. Tests show that very fine fuel droplet sprays are formed leading to substantial improvements in combustion efficiency. Evaluation of this performance potential, however, requires thorough investigation of the flow rate/pressure drop/heating rate influence on spray quality and droplet distribution. Such tests were performed on two SFI geometries with steady flows of Jet A fuel. When these flows were discharged directly to the atmosphere, pressure drop reached a minimum at heating rates of 280 J/cc. At this point, spray quality improved noticeably, showing substantial fog or mist production, which became complete mist as the heating rate approached three-fourths the Jet A enthalpy of vaporization. Similar tests of SFI flows exhausting through conventional spray nozzles showed appreciable improvement in spray quality, producing 50% or more mist at heating rates about one-third less than those required in the absence of nozzles. ROTOR FRAGMENT PROTECTION PROGRAM: STATISTICS ON AIRCRAFT GAS TURBINE NGINE ROTOR FAILURES THAT OCCURRED IN U.S. COMMERCIAL AVIATION DURING 1978 Final Report, 1977 - 1978
R. A. DeLucia and J. T. Salvino Sep. 1981 30 p
(NASA Order C-41581-B)
(NASA-CR-165388; NAS 1.26:165388; AD-A113767; NAPC-PE-23) Avail: NTIS HC A03/MF A01 CSCL 21/5

This report presents statistical information relating to the number of gas turbine engine rotor failures which occurred in commercial aviation service use. The predominant failure involved blade fragments, 82.4 percent of which were contained. Although fewer rotor rim, disk, and seal failures occurred, 33.3%, 100% and 50% respectively were uncontained. Sixty-five percent of the 166 rotor failures occurred during the takeoff and climb stages of flight. Author (GRA)

(AD-A113461; AFLRL-144-Vol-1) Avail: NTIS HC A10/MF A01 CSCL 15/5

Activities and findings are reported for a 12-month program aimed at the development of procedures for accelerating the qualification of new fuels on Army equipment, emphasizing those derived from oil shale and coal. Prinicpal activities were identification of key tactical and combat surface and air vehicles, powerplants, and fuels systems components; identification of critical properties peculiar to new fuels anticipated to have significant impact upon Army materiel; laboratory evaluations of materials compatibility and fuels characteristics (including lubricity, elastomer compatibility, thermal stability, and corrosion); full-scale fuel systems component testing, and an overall review and evaluation of existing engine/fuel system qualification procedures. Conclusions and recommendations are presented in terms of methodology and criteria which will realistically address key peculiarities of alternative fuels and thus serve to accelerate their qualification for field Army use. Author (GRA)

N82-27318# Southwest Research Inst., San Antonio, Tex. Army Fuels and Lubricants Research Lab.

Acoustic emission in jet engine fan blades A82-35257
Structural dynamics of shroudless, hollow, fan
blades with composite in-lays
[ASME PAPER 82-GT-284] A82-35456
Composite containment systems for jet engines A82-37062
Bird impact analysis package for turbine engine
fan blades
[NASA-TM-82831] N82-26701
FATIGUE LIFE
Turbine blade nonlinear structural and life analysis
[AIAA PAPER 82-1056] A82-34981
Control of gas turbine power transients for
improved turbine airfoil durability
[AIAA PAPER 82-1182] A82-35047
A method for observing the deterioration of
airframe life in operational conditions A82-37123
Comparison of different fighter aircraft load
spectra
[FFA-TN-1982-02] N82-27280
FATIGUE TESTS
T700 - Modern development test techniques, lessons
learned and results
[AIAA PAPER 82-1183] A82-35080

Navy's F/A-18 expected to be an effective performer but problems still face the program
[AD-A111877] N82-26281
Mission effectiveness of the AV-8B Harrier 2 could be improved if actions are taken now
[AD-A111878] N82-26284
Aviation Materiel Combat Ready In-Country (AMCRIC)
[AD-A107451] N82-27283

LONGITUDINAL STABILITY
Annular wing
[NASA-CASE-FRC-11007-2] N82-26277

LOOP ANTENNAS
A balanced active antenna and impulse noise blanket system for the Reydist T radio navigation receiver
[AD-A114074] N82-27275

LORAN
PPOD Programmable pilot-oriented display --- air navigation
N82-26201

LORAN C
Certification of an airborne Loran-C navigation system
A82-35876
Joint University Program Air for Transportation Research, 1981
[NASA-CP-2224] N82-26199
Investigation of air transportation technology at Ohio University, 1981 --- loran
N82-26204
Loran-C plotting program for plotting lines of position on standard charts
N82-26206
A Loran-C prototype navigation receiver for general aviation
N82-26207
A Loran-C prototype navigation receiver for general aviation
N82-26208
Commutated automatic gain control system
N82-26209
A prototype interface unit for microprocessor-based Loran-C receiver
N82-26210
A Loran-C prototype navigation receiver for general aviation
[NASA-CR-169118] N82-27259

LOW ALTITUDE
Pave Mover aided integrated strike avionics system
N82-27298
Adaptive multifunction sensor concept for air-ground missions
N82-27299

LOW NOISE
On the design and test of a low noise propeller
[NASA-CR-165938] N82-27089

LOW TEMPERATURE ENVIRONMENTS
Cold regions testing of an air transportable shelter
[AD-A107131] N82-27325

LOW TEMPERATURE TESTS
The low temperature properties of aviation fuels
[ASME PAPER 82-GT-48] A82-35306

LUBRICANTS
Turbine engine lubricant reclamation
[AD-A112098] N82-26312

LUBRICATING OILS
The effect of journal misalignment on the oil-film forces generated in a squeeze-film damper
[ASME PAPER 82-GT-285] A82-35457
Evaluation of plasma source spectrometers for the Air Force Oil Analysis Program
[AD-A113809] N82-27512

LUBRICATION
An alternate test procedure to qualify future fuels for Navy aircraft
[AIAA PAPER 82-1233] A82-36175

LUMINAIRES
Microwave Landing System flare subsystem test
[AD-A107327] N82-27263

M

MACH NUMBER
In-flight acoustic results from an advanced-design propeller at Mach numbers to 0.8
[AIAA PAPER 82-1120] A82-35017
Increased capabilities of the Langley Mach 7 Scramjet Test Facility
[AIAA PAPER 82-1240] A82-35080

On the performance prediction of a centrifugal compressor scaled up
[ASME PAPER 82-GT-112] A82-35345
Development and application of a performance prediction method for straight rectangular diffuser
[ASME PAPER 82-GT-122] A82-35352

MAGNETIC MATERIALS
Torsional stiffness element based on cobalt-samarium magnets --- for a turn and bank indicator
[BMFT-FB-W-81-044] N82-27292

MAGNETIC MEASUREMENT
Magnetic heading reference
[NASA-CASE-LAR-12630-1] N82-26260

MAGNETIC POLES
A comparison of pole positions derived from GPS satellite and Navy navigation satellite observations
[AD-A110765] N82-26268

MAINTENANCE
Maintenance training simulator design and acquisition: Handbook of ISD procedures for design and documentation
[AD-A111430] N82-26321
Depot support of gas turbine engines
[AD-A107141] N82-27217

MAN MACHINE SYSTEMS
Integrated flight trajectory control
[AD-A110998] N82-26319
Advanced technology and fighter cockpit design: Which drives which?
N82-27302

MANAGEMENT METHODS
Optimal placement model for the B-52G weapons system trainer
[AD-A110977] N82-26323

MANAGEMENT PLANNING
Depot support of gas turbine engines
[AD-A107141] N82-27217
Preplanned product improvement and other modification strategies: Lessons from past aircraft modification programs
[AD-A113599] N82-27220

MANUAL CONTROL
Flight experiments using the front-side control technique during piloted approach and landing in a powered lift STOL aircraft
[NASA-TM-81337] N82-26314

MAP MATCHING GUIDANCE
An automatic map reader suitable for use in helicopters
A82-37775

MAPPING
Loran-C plotting program for plotting lines of position on standard charts
N82-26206

MASS FLOW
Accuracy expectations for gas turbine and centrifugal compressor performance testing
[ASME PAPER 82-GT-128] A82-35358

MATERIALS HANDLING
Advanced internal cargo system concept demonstration and evaluation
[AD-A111990] N82-26282

MATERIALS SCIENCE
Evaluation criteria for aero engine materials
A82-36065

MATHEMATICAL MODELS
EAGLE - An interactive engine/airframe life cycle cost model
[ASME PAPER 82-GT-56] A82-35311
A stage-by-stage dual-spool compression system modeling technique
[ASME PAPER 82-GT-189] A82-35394
A spark ignition model for liquid fuel sprays applied to gas turbine engines
A82-37220
Monofilar - A dual frequency rotorhead absorber
[AHS PREPRINT 81-20] A82-37791
A nonlinear response analysis for coupled rotor-fuselage systems
[AHS PREPRINT 81-23] A82-37798
A model for sensor-interceptor trade-off analysis
[AD-A112046] N82-26271
Application of adaptive estimation to target tracking
[AD-A112036] N82-26272

Investigation of an improved structural model for
damaged T-38 horizontal stabilizer flutter
analysis using NASTRAN N82-26316
[AD-A111095]
Gravity induced position errors in airborne
inertial navigation N82-27272
[AD-A113823]
MATHIEU FUNCTION
The influence of Coriolis forces on gyroscopic
motion of spinning blades A82-35384
[ASME PAPER 82-GT-163]
MECHANICAL DRIVES
CFC drive shaft and CFC coupling for the tail
rotor of the BO 105 A82-37766

High-speed rotary printing device for air traffic
control applications: A preliminary evaluation
N82-27264
[AD-A107325]
MECHANICAL ENGINEERING
Bibliography of Lewis Research Center technical
publications announced in 1981 N82-27191
[NASA-TM-82830]
MECHANICAL PROPERTIES
Mechanical property characterization and modeling
of structural materials --- for airframes and
aircraft gas turbine engines N82-27704
[AD-A113841]
METAL COATINGS
Application and testing of metallic coatings on
graphite/epoxy composites A82-37074

METAL JOINTS
Evaluation of sensitivity of ultrasonic detection
of disbonds in graphite/epoxy to metal joints
A82-37080

METAL MATRIX COMPOSITES
Fuselage structure using advanced technology fiber
reinforced composites N82-26384
[NASA-CASE-LAR-11688-1]
METAL WORKING
Net shape components for small gas turbine engines
A82-35338
[ASME PAPER 82-GT-96]
METALS
Strategic materials - Technological trends
A82-37972

Research and development on wear metal analysis
N82-26446
[AD-A112100]
Evaluation of plasma source spectrometers for the
Air Force Oil Analysis Program N82-27512
[AD-A113809]
METEOROLOGICAL FLIGHT
Aircraft measurements of icing in supercooled and
water droplet/ice crystal clouds A82-36054

METEOROLOGICAL PARAMETERS
Triggered lightning --- resulting from aircraft
atmospheric electricity interactions
A82-35727

Aviation meteorology --- Russian book A82-36972

Briefs of fatal accidents involving weather as a
cause/factor, U.S. general aviation, 1979
N82-27240
[PB82-138934]
Response of cloud microphysical instruments to
aircraft icing conditions N82-27284
[AD-A112317]
METEOROLOGICAL SERVICES
Aviation meteorology --- Russian book
A82-36972

MICROCOMPUTERS
A Loran-C prototype navigation receiver for
general aviation N82-26208

Commutated automatic gain control system
N82-26209

A floating-point/multiple-precision processor for
airborne applications N82-26289
[NASA-TM-84252]
MICROPARTICLES
Small engine inlet air particle separator technology
A82-35299
[ASME PAPER 82-GT-40]
MICROPROCESSORS
PMUX - The interface for engine data to AIDS ---
propulsion multiplexer in Aircraft Integrated
Data System A82-35022
[AIAA PAPER 82-1127]

An approach to software for high integrity
applications --- in aircraft gas turbine engine
control A82-35430
[ASME PAPER 82-GT-251]
Joint University Program Air for Transportation
Research, 1981 N82-26190
[NASA-CP-2224]
PPOD Programmable pilot-oriented display --- air
navigation N82-26301

MICROSTRIP TRANSMISSION LINES
Advanced microstrip antenna developments. Volume
2: Microstrip GPS antennas for general aviation
aircraft N82-27380
[AD-A113620]
MICROWAVE CIRCUITS
An accurate Doppler navigator with microwave
simplicity A82-37037

MICROWAVE EQUIPMENT
Microwave ice prevention N82-26203

MICROWAVE LANDING SYSTEMS
Life-cycle-cost analysis of the microwave landing
system ground and airborne systems N82-26286
[AD-A110909]
Flight-test verification of a pictorial display
for general aviation instrument approach
N82-26288
[NASA-TM-83305]
Microwave Landing System flare subsystem test
N82-27263
[AD-A107327]
MIDAIR COLLISIONS
Briefs of accidents involving midair collisions:
U.S. general aviation, 1979 N82-27251
[PB82-138900]
Listing of aircraft accidents/incidents by make
and model, U.S. civil aviation, 1979
N82-27252
[PB82-138892]
MILITARY AIRCRAFT
Combat survivability in the Advanced Technology
Engine Study /ATES/ A82-35181

STRUCTURAL ANALYSIS
Bird impact analysis package for turbine engine fan blades
[NASA-TM-82831] N82-26701
STRUCTURAL DESIGN
Next generation turboprop gearboxes
[ASME PAPER 82-GT-236] A82-35418
STRUCTURAL DESIGN CRITERIA
Factors shaping conceptual design of rotary-wing aircraft
A82-37773
A unified approach to helicopter NASTRAN modeling
[AHS PREPRINT 81-22] A82-37793
Use of optimization in helicopter vibration control by structural modification
[AHS PREPRINT 81-27] A82-37797
Static and aeroelastic optimization of aircraft
A82-37945
Foreign object impact design criteria, volume 2
[AD-A112701] N82-27313
Foreign object impact design criteria, volume 3
[AD-A112447] N82-27314
STRUCTURAL FAILURE
Turbine blade nonlinear structural and life analysis
[AIAA PAPER 82-1056] A82-34981
The use of performance-monitoring to prevent compressor and turbine blade failures
[ASME PAPER 82-GT-66] A82-35316
STRUCTURAL MEMBERS
Advanced concepts for composite structure joints and attachment fittings. Volume 2: Design guide
[AD-A111106] N82-26280
STRUCTURAL RELIABILITY
Develop, demonstrate, and verify large area composite structural bonding with polyimide adhesives --- adhesively bonding graphite-polyimide structures
[NASA-CR-165839] N82-26465
STRUCTURAL VIBRATION
The use of performance-monitoring to prevent compressor and turbine blade failures
[ASME PAPER 82-GT-66] A82-35316
Solution to a bistable vibration problem using a plain, uncentralized squeeze film damper bearing
[ASME PAPER 82-GT-281] A82-35455
Low vibration design of AAH for mission proficiency requirements --- Advanced Attack Helicopter
[AHS PREPRINT 81-2] A82-37778
The Helicopter Ride Revolution
[AHS PREPRINT 81-4] A82-37780
Determination of in-flight helicopter loads and vibration
[AHS PREPRINT 81-7] A82-37782
Design and evaluation of a state-feedback vibration controller
[AHS PREPRINT 81-10] A82-37783
Considerations of open-loop, closed-loop, and adaptive multicyclic control systems
[AHS PREPRINT 81-13] A82-37786
Flight demonstration of an integrated floor/fuel isolation system
[AHS PREPRINT 81-16] A82-37788
A finite element analysis of coupled rotor fuselage vibration
[AHS PREPRINT 81-21] A82-37792
A nonlinear response analysis for coupled rotor-fuselage systems
[AHS PREPRINT 81-23] A82-37794
Substructure program for analysis of helicopter vibrations
[AHS PREPRINT 81-24] A82-37795
Use of optimization in helicopter vibration control by structural modification
[AHS PREPRINT 81-27] A82-37797
STRUCTURAL WEIGHT
Performance deterioration due to acceptance testing and flight loads; JT9D jet engine diagnostic program
[NASA-CR-165572] N82-27309
SUBROUTINES
Loran-C plotting program for plotting lines of position on standard charts
N82-26206
The Sortie-Generation Model system. Volume 5: Maintenance subsystem
[AD-A110815] N82-26225
The Sortie-Generation Model system. Volume 6: Spares subsystem
[AD-A110900] N82-26226
SUBSONIC AIRCRAFT
Investigation of subsonic nacelle performance improvement concept
[AIAA PAPER 82-1042] A82-37676
SUBSTRUCTURES
Substructure program for analysis of helicopter vibrations
[AHS PREPRINT 81-24] A82-37795
SUPERCHARGERS
Advanced stratified charge rotary aircraft engine design study
[NASA-CR-165398] N82-27743
SUPERCOOLING
Aircraft measurements of icing in supercooled and water droplet/ice crystal clouds
A82-36054
SUPERHEATING
Investigation of spray characteristics for flashing injection of fuels containing dissolved air and superheated fuels
[NASA-CR-3563] N82-26295
SUPERHIGH FREQUENCIES
Medium PRF performance analysis --- Pulse-Repetition Frequency
A82-37378
SUPERSONIC AIRCRAFT
NASA research in supersonic propulsion: A decade of progress
[NASA-TM-82862] N82-26300
SUPERSONIC COMBUSTION RAMJET ENGINES
Increased capabilities of the Langley Mach 7 Scramjet Test Facility
[AIAA PAPER 82-1240] A82-35080
SUPERSONIC DIFFUSERS
Casing treatments on a supersonic diffuser for high pressure ratio centrifugal compressors
[ASME PAPER 82-GT-85] A82-35331
SUPERSONIC FLIGHT
Supersonic cruise/transonic maneuver wing section development study
[AD-A110686] N82-26256
SUPERSONIC INLETS
An inviscid-viscous interaction treatment to predict the blade-to-blade performance of axial compressors with leading edge normal shock waves
[ASME PAPER 82-GT-135] A82-35363
SUPERSONIC NOZZLES
Transonic wind tunnel test of a supersonic nozzle installation
[AIAA PAPER 82-1045] A82-37677
SUPERSONIC TURBINES
Investigation of the transonic calibration characteristics of turbine static pressure probes
[ASME PAPER 82-GT-280] A82-35454
SURFACE GEOMETRY
Geometrical aspects of the tribological properties of graphite fiber reinforced polyimide composites
[ASLE PREPRINT 82-AM-5A-2] A82-37855
SURFACE NAVIGATION
Study of the global positioning system for maritime concepts/applications: Study of the feasibility of replacing maritime shipborne navigation systems with NAVSTAR
[NASA-CR-169031] N82-26263
The Worldwide Navigational Warning Service
[AD-A107372] N82-26276
SURFACE ROUGHNESS
The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine
[ASME PAPER 82-GT-222] A82-35409
SURVEILLANCE RADAR
Test and evaluation of the airport radar wind shear detection system
[AD-A112663] N82-27924
SURVIVAL EQUIPMENT
Lear Fan 2100 egress system
A82-37970
Development of a backpack survival kit for ejection seats
[AD-A113653] N82-27242
SUSPENSION SYSTEMS (VEHICLES)
Preliminary study of ground handling characteristics of Buoyant Quad Rotor (BQR) vehicles
[NASA-CR-166130] N82-26220

SWEAT COOLING
Two-phase transpiration cooling
[ASME PAPER 82-GT-89] A82-35333
SWEPT WINGS
Supersonic cruise/transonic maneuver wing section development study
[AD-A110686] N82-26256
SWIRLING
Improved vane-island diffusers at high swirl
[ASME PAPER 82-GT-68] A82-35310
SYNTHETIC FUELS
Mobility fuels for the Navy
[AD-A112511] N82-26485
Development of Army high-energy fuel diesel/turbine-powered surface equipment, phase 2
[AD-A111942] N82-26487
Development of accelerated fuel-engines qualification procedures methodology, volume 1
[AD-A113461] N82-27317
Development of accelerated fuel-engines qualification procedures methodology. Volume 1: Appendices
[AD-A113532] N82-27318
SYSTEM EFFECTIVENESS
Efficient part removal processes --- from molds
A82-37097
SYSTEM FAILURES
Instrument failure detection in partially observable systems
A82-37380
SYSTEM IDENTIFICATION
Development of low-order model of an X-wing aircraft by system identification
[AD-A113760] N82-27286
SYSTEMS ENGINEERING
A practical approach to the design of multivariable control strategies for gas turbines
[ASME PAPER 82-GT-150] A82-35374
Assembly of aircraft instruments --- Russian book
A82-36950
Simplified digital design tools
A82-37034
Design and evaluation of a state-feedback vibration controller
[AHS PREPRINT 81-10] A82-37783
Current ADM restraint system status, trade-off constraints and long range objectives for the Maximum Performance Ejection System (MPES)
[AD-A112645] N82-27238
Development of a backpack survival kit for ejection seats
[AD-A113653] N82-27242
Terminal air traffic control with surveillance data from the mode 5 system: Results of system demonstrations to field controllers
[AD-A112632] N82-27268
SYSTEMS INTEGRATION
Integrated aircraft avionics and powerplant control and management systems
[ASME PAPER 82-GT-165] A82-35385
Air-ground attack: Axes of research for airborne systems
N82-27295
Pave Mover aided integrated strike avionics system
N82-27298
Tactical systems approach to interdiction of 2nd echelon moving targets using real time sensors
N82-27306
SYSTEMS SIMULATION
TURBOTRANS - A programming language for the performance simulation of arbitrary gas turbine engines with arbitrary control systems
[ASME PAPER 82-GT-200] A82-35396

T

T-56 ENGINE
Next generation turboprop gearboxes
[ASME PAPER 82-GT-236] A82-35418
TABLES (DATA)
Update of the summary report of 1977-1978 task force on aircrew workload
[AD-A112547] N82-26258
TACTICS
Tactical systems approach to interdiction of 2nd echelon moving targets using real time sensors
N82-27306
TAIL ASSEMBLIES
Determination of rotor wake induced empennage airloads
[AHS PREPRINT 81-26] A82-37796
TAIL ROTORS
CFC drive shaft and GFC coupling for the tail rotor of the BO 105
A82-37766
TAPE RECORDERS
Marine Air Traffic Control and Landing System (MATCALS) investigation
[AD-A113047] N82-27276
TARGET ACQUISITION
Medium PRF performance analysis --- Pulse-Repetition Frequency
A82-37378
A model for sensor-interceptor trade-off analysis
[AD-A112046] N82-26271
Application of adaptive estimation to target tracking
[AD-A112036] N82-26272
Air-ground attack: Axes of research for airborne systems
N82-27295
Advanced target acquisition and tracking concepts for real time applications
N82-27305
TARGET RECOGNITION
Some potential novel approaches to the automatic airborne detection and identification of ground targets
N82-27296
Adaptive multifunction sensor concept for air-ground missions
N82-27299
Digital image processing for acquisition, tracking, hand off and ranging
N82-27303
Advanced target acquisition and tracking concepts for real time applications
N82-27305
Automatic handoff of multiple targets
[AD-A107490] N82-27561
TARGETS
Automatic handoff of multiple targets
[AD-A107490] N82-27561
TAXIING
Briefs of accidents involving computer air carriers and on-demand air taxi operations, U.S. general aviation, 1979
[PB82-130991] N82-27255
TAYLOR SERIES
A mixed-flow cascade passage design procedure based on a power series expansion
[ASME PAPER 82-GT-121] A82-35351
TECHNOLOGICAL FORECASTING
Charting propulsion's future - The ATES results --- Advanced technology Engine Studies program for aircraft engine design
[AIAA PAPER 82-1139] A82-35023
Next generation trainer /NGT/ engine requirements - An application of lessons learned
[AIAA PAPER 82-1184] A82-35049
A concept for light-powered flight
[AIAA PAPER 82-1214] A82-35067
CFD technology for propulsion installation design - Forecast for the 80's --- computational fluid dynamics in aerospace applications
[ASME PAPER 82-GT-21] A82-35289
The potential impact of future fuels on small gas turbine engines
[ASME PAPER 82-GT-133] A82-35362
Cycle considerations for tactical fighters in the early 1990's
[ASME PAPER 82-GT-259] A82-35436
Material and process impact on aircraft engine designs of the 1990's
[ASME PAPER 82-GT-278] A82-35453
Weapon system of a future attack aircraft
N82-27301
TECHNOLOGY ASSESSMENT
Energy efficient engine /E3/ technology status
[AIAA PAPER 82-1052] A82-34980
Development of hybrid gas turbine bucket technology
[ASME PAPER 82-GT-94] A82-35337
Technology advancements for energy efficient aircraft engines
[AIAA PAPER 82-1051] A82-35479

DOUGHERTY, B. L.
Effect on fuel efficiency of parameter variations in the cost function for multivariable control of a turbofan engine
[AD-A110614] N82-26301
DU VAL, R. W.
Design and evaluation of a state-feedback vibration controller

[NASA-TM-82908] N82-27519

THERMODYNAMIC EFFICIENCY
Conversion of centrifugal compressor performance curves considering non-similar flow conditions
[ASME PAPER 82-GT-42] A82-35300
The effect of coolant flow on the efficiency of a transonic HP turbine profile suitable for a small engine
[ASME PAPER 82-GT-63] A82-35315

THERMODYNAMIC PROPERTIES
Experimental study of external fuel vaporization
[ASME PAPER 82-GT-59] A82-35312

THICKNESS
The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine
[ASME PAPER 82-GT-222] A82-35409

THIN WALLED SHELLS
Measurements of heat transfer coefficients on gas turbine components. II - Applications of the technique described in part I and comparisons with results from a conventional measuring technique and predictions
[ASME PAPER 82-GT-175] A82-35388

THREE DIMENSIONAL FLOW
Experimental investigations on the flow in the impeller of a centrifugal fan
[ASME PAPER 82-GT-37] A82-35298
On the vortex flow over delta and double-delta wings
[AIAA PAPER 82-0949] A82-37466
A grid interfacing zonal algorithm for three-dimensional transonic flows about aircraft configurations
[AIAA PAPER 82-1017] A82-37477
Comparison of experimental and analytical performance for contoured endwall stators
[NASA-TM-82877] N82-26299
Wind tunnel measurements of three-dimensional wakes of buildings --- for aircraft safety applications
[NASA-CR-3565] N82-26921

THROTTLING
Individual bypass throttling in fighter engines
[AIAA PAPER 82-1285] A82-35100

THRUST AUGMENTATION
An experimental study of rectangular and circular thrust augmenting ejectors
[AD-A111110] N82-26304

THRUST MEASUREMENT
Evaluation of a simplified gross thrust calculation method for a J85-21 afterburning turbojet engine in an altitude facility
[AIAA PAPER 82-1044] A82-34978

THRUST REVERSAL
Thrust reverser induced flow interference on tactical aircraft stability and control
[AIAA PAPER 82-1133] A82-37693
Static internal performance characteristics of two thrust reverser concepts for axisymmetric nozzles
[NASA-TP-2025] N82-26235
Thrust reverser for a long duct fan engine --- for turbofan engines
[NASA-CASE-LEW-13199-1] N82-26293
Minimum time turns constrained to the vertical plane
[AD-A111096] N82-26317

TIME OPTIMAL CONTROL
Minimum time turns constrained to the vertical plane
[AD-A111096] N82-26317

TITANIUM
Structural dynamics of shroudless, hollow, fan blades with composite in-lays
[ASME PAPER 82-GT-284] A82-35456

TORSION
Torsional stiffness element based on cobalt-samarium magnets --- for a turn and bank indicator
[BMFT-FB-W-81-044] N82-27292

TRACKING (POSITION)
Multiple aircraft tracking system for coordinated research missions
A82-35869
Advanced target acquisition and tracking concepts for real time applications
N82-27305

TRACKING NETWORKS
Multiple aircraft tracking system for coordinated research missions
A82-35869

TRADEOFFS
Current ADM restraint system status, trade-off constraints and long range objectives for the Maximum Performance Ejection System (MPES)
[AD-A112645] N82-27238
TRAILING EDGES
The effect of coolant flow on the efficiency of a transonic HP turbine profile suitable for a small engine
[ASME PAPER 82-GT-63] A82-35315
Steady, Oscillatory, and Unsteady Subsonic and Supersonic Aerodynamics, production version 1.1 (SOUSSA-P1.1). Volume 2: User/programmer manual. Addendum 1: Analytical treatment of wake influence
[NASA-TM-84484] N82-26236
TRAINING AIRCRAFT
Next generation trainer /NGT/ engine requirements - An application of lessons learned
[AIAA PAPER 82-1184] A82-35049
Mission effectiveness of the AV-8B Harrier 2 could be improved if actions are taken now
[AD-A111878] N82-26284
TRAINING DEVICES
Maintenance training simulator design and acquisition: ISD-derived training equipment design
[AD-A110871] N82-26221
Maintenance training simulator design and acquisition: Handbook of ISD procedures for design and documentation
[AD-A111430] N82-26321
TRAINING EVALUATION
Maintenance training simulator design and acquisition: Handbook of ISD procedures for design and documentation
[AD-A111430] N82-26321
TRAJECTORIES
Minimum time turns constrained to the vertical plane
[AD-A111096] N82-26317
TRANSFER FUNCTIONS
Simplified digital design tools
A82-37034
TRANSIENT RESPONSE
Blade loss transient dynamic analysis of turbomachinery
[AIAA PAPER 82-1057] A82-34982
Transient vibration of high speed lightweight rotor due to sudden imbalance
[ASME PAPER 82-GT-231] A82-35413
Engine dynamic analysis with general nonlinear finite element codes. II - Bearing element implementation, overall numerical characteristics and benchmarking
[ASME PAPER 82-GT-292] A82-35462
Aerodynamic lag functions, divergence, and the British flutter method
A82-35820
Transient simulation of gas turbines including the effects of heat capacity of the solid parts
[ISBN-951-752-496-X] N82-26296
Assessment of lightning simulation test techniques, part 1
[AD-A112626] N82-27663
TRANSMISSION LINES
Effects of high voltage transmission lines on non-directional beacon performance
[AD-A112311] N82-27261
TRANSMISSIONS (MACHINE ELEMENTS)
Selecting the best reduction gear concept for prop-fan propulsion systems
[AIAA PAPER 82-1124] A82-35020
TRANSONIC COMPRESSORS
Performance analysis of the test results on a two-stage transonic fan
[ASME PAPER 82-GT-123] A82-35353
TRANSONIC FLIGHT
Commercial transports - Aerodynamic design for cruise performance efficiency
A82-35555
Practical aerodynamic problems - Military aircraft
A82-35556
Extension of FLO codes to transonic flow prediction for fighter configurations
A82-35564
Supersonic cruise/transonic maneuver wing section development study
[AD-A110686] N82-26256
TRANSONIC FLOW
A computational design method for transonic turbomachinery cascades
[ASME PAPER 82-GT-117] A82-35348
Transonic design using computational aerodynamics
A82-35560
Application of computational methods to transonic wing-design
A82-35561
A-7 transonic wing designs
A82-35562
Transonic computational experience for advanced tactical aircraft
A82-35563
Extension of FLO codes to transonic flow prediction for fighter configurations
A82-35564
A series of airfoils designed by transonic drag minimization for Gates Learjet aircraft
A82-35565
Applied computational transonics - Capabilities and limitations
A82-35566
Evaluation of full potential flow methods for the design and analysis of transport wings
A82-35567
A grid interfacing zonal algorithm for three-dimensional transonic flows about aircraft configurations
[AIAA PAPER 82-1017] A82-37477
TRANSONIC NOZZLES
Heat transfer measurements of a transonic nozzle guide vane
[ASME PAPER 82-GT-247] A82-35426
TRANSONIC WIND TUNNELS
Experimental testing at transonic speeds --- wind tunnels
A82-35557
Transonic wind tunnel test of a supersonic nozzle installation
[AIAA PAPER 82-1045] A82-37677
Operating manual holographic interferometry system for 2 x 2 foot transonic wind tunnel
[NASA-CR-166344] N82-26218
TRANSPONDERS
Frequency sharing between passive sensors and aeronautical radionavigation systems employing ground transponders in the band 4.2 - 4.4 GHz
[NASA-CR-169041] N82-26261
TRANSPORT AIRCRAFT
Transport engine control design
[AIAA PAPER 82-1076] A82-34996
Commercial transports - Aerodynamic design for cruise performance efficiency
A82-35555
An analytical study of turbulence responses, including horizontal tail loads, of a control configured jet transport with relaxed static stability
N82-26313
Characteristics of future aircraft impacting aircraft and airport compatibility
[NASA-TM-84476] N82-27233
Cabin safety in large transport aircraft
[PB82-129257] N82-27244
TRANSPORT VEHICLES
Use of CGHRP in transport --- Carbon and Glass Hybrid Reinforced Plastics
A82-37061
TRANSPORTATION
Transportation noise, its impact, planning and regulation
[S-258] N82-27864
TRIBOLOGY
Geometrical aspects of the tribological properties of graphite fiber reinforced polyimide composites
[ASLE PREPRINT 82-AM-5A-2] A82-37055
TURBINE BLADES
Energy efficient engine /E3/ technology status
[AIAA PAPER 82-1052] A82-34980
Turbine blade nonlinear structural and life analysis
[AIAA PAPER 82-1056] A82-34981
Control of gas turbine power transients for improved turbine airfoil durability
[AIAA PAPER 82-1182] A82-35087
A comprehensive method for preliminary design optimization of axial gas turbine stages
[AIAA PAPER 82-1264] A82-35091

GODSTON, J.

QUIET SHORT-HAUL RESEARCH AIRPLANE (QSRA) MODEL SELECT PANEL FUNCTIONAL DESCRIPTION
DeLamar M. Watson May 1982 121 p refs
(NASA-TM-84243; A-8915; NAS 1.15:84243) Avail: NTIS HC A06/MF A01 CSCL 01C

The QSRA, when equipped with programmable color cathode ray tube displays, a head up display, a general purpose digital computer and a microwave landing system receiver, will provide a capability to do handling qualities studies and terminal area operating systems experiments as well as to enhance an experimenter's ability to obtain repeatable aircraft performance data. The operating systems experiments include the capability to generate minimum fuel approach and departure paths and to conduct precision approaches to a STOLport runway. The mode select panel is designed to provide both the flexibility needed for a variety of flight test experiments and the minimum workload operation required by pilots flying into congested terminal traffic areas. RELIABILITY AND MAINTAINABILITY ANALYSIS OF FLUIDIC BACK-UP FLIGHT CONTROL SYSTEM AND COMPONENTS Final Report
William H. Skewis and David R. Keyser Sep. 1981 61 p refs
(Contract N62269-81-M-3047)
(AD-A110496; NADC-80227-60) Avail: NTIS HC A04/MF A01 CSCL 01/4

Fluidic components being used in various aircraft applications are demonstrating extremely high reliability. However, the unique design of new fluidic components results in a very limited failure rate data base and prevents the determination of numerical values of fluidic system reliability at a sufficient confidence level. This report identifies the potential failure modes of typical components used in a Fluidic Backup Flight Control System and establishes their frequencies of occurrence from published test reports. DIGITAL COMMAND AUGMENTATION FOR LATERAL DIRECTIONAL AIRCRAFT DYNAMICS M.S. Thesis
David Atzhorn May 1981 203 p refs
(AD-A107264; AFIT-CI-81-55T) Avail: NTIS HC A10/MF A01 CSCL 09/2

Linear-quadratic sampled-data regulator theory is used to design several Type 0 and Type 1 control laws for lateral-directional aircraft dynamics. Control structures are defined for singular command inputs and for control rate outputs; the former allows for precise following of a command whose integral appears in the state vector, while the latter uses both a difference approximation and the Tustin transform to characterize control rate in the discrete-time domain. Type 0 controllers with control rate restraint and 'equivalent' Type 1 controllers are implemented in a microprocessor-based digital flight control system, and flight tests are conducted using Princeton University's Variable-Response Research Aircraft. The control system, entitled CAS-4, offers four combinations of control: direct (unaugmented) control, Type 0 control with both roll rate/sideslip angle and roll rate/lateral acceleration command combinations, and Type 1 control with roll rate/sideslip angle command. Ground-based hybrid simulation and flight tests results show that major closed-loop response features are unaffected by the choice of sampling rate when sampled-data regulator is used. Consequently, much lower sampling rates than would normally be expected can be used when control laws are derived in this manner (a sampling rate of 10 sps is primarily used in this investigation, though lower sampling rates are investigated as well). The results derived through this investigation and presented herein provide additional evidence that digital flight control through modern control theory will be a practical way of implementing flight control systems in future high performance aircraft. NOTES ON LATERAL-DIRECTIONAL PILOT INDUCED OSCILLATIONS Final Report, May 1979 - May 1981
Ralph H. Smith Wright-Patterson AFB, Ohio AFWAL Mar. 1982 84 p refs
(Contract F33615-79-C-3620; AF Proj. 2403)
(AD-A113996; AFWAL-TR-81-3090) Avail: NTIS HC A05/MF A01 CSCL 05/8

A method is developed for the assessment of lateral-directional pilot induced oscillation (PIO) tendencies. The method is applicable regardless of the flight control system mechanization. The relations between linear and non-linear system effects on the probability or nature of PIO are discussed. In its simplest form, the method proposed for PIO assessment is very similar to methods currently in use. The principal difference is that quantitative methods are provided for the identification of specific frequencies at which appropriate stability criteria must be satisfied if PIO is not to be a possibility. Based upon analyses in this report, the single axis, bank angle PIO is believed to be the most commonly encountered lateral-directional PIO. The possibility for pitch only PIO in the longitudinal mode is discussed. The methods of this report are believed to apply to the study of longitudinal PIO. Author (GRA)

REPORTS BY SYSTEMS TECHNOLOGY, INC., IN SUPPORT OF CARRIER-LANDING RESEARCH IN THE VISUAL TECHNOLOGY RESEARCH SIMULATOR Interim Report, 1 May 1980 - 30 Nov. 1981
W. F. Jewell, H. R. Jex, R. E. Magdaleno, and R. F. Ringland Dec. 1981 65 p refs
(Contract N61339-78-C-0060)
(AD-A112466; TR-81-025; NAVTRAEQUIPC-78-C-0060-10) Avail: NTIS HC A04/MF A01 CSCL 01/2

The following work was undertaken: (1) Development of a quasi-random turbulence model. This model was preferred to the one provided initially with the VTRS system because it enabled better analysis of pilot responses to turbulence inputs. The STI model is expected to be appropriate for tasks other than carrier landings and for simulations of other aircraft types. (2) Modification of the T-2C simulation to more closely represent the A-7 and F-18 aircraft. (3) Application and evaluation of STI's Non-Intrusive Pilot Identification Program (NIPIP), which was developed to estimate the pilot's input-output describing function and combined pilot-vehicle performance parameters such as crossover frequency and phase margin by using a time domain model of the pilot and a least-squares identification algorithm. NIPIP functions in real-time and uses a sliding time window to maintain freshness in the data; thus time-varying characteristics in the pilot's control strategy can be measured. GRA

COLD REGIONS TESTING OF AN AIR TRANSPORTABLE SHELTER
Stephen N. Flanders Aug. 1981 28 p refs
(DA Proj. 4A7-82730-AT-42)
(AD-A107131; CRREL-81-16) Avail: NTIS HC A03/MF A01 CSCL 13/13

An air-transportable shelter designed and built at CRREL for use in cold regions underwent testing in Hanover, New Hampshire, and Ft. Greely, Alaska. The shelter demonstrated some of its capabilities for mobility by being towed for more than 60 miles behind various vehicles and by being transported on a C-130 cargo airplane, a CH-47 helicopter, and a trailer truck. The shelter proved to be very easy for a crew of two to four to set up in all weather conditions including -40 F cold. However, the gasoline-powered generator, which was a source for space heat as well as electricity, functioned very poorly. Overall, the prototype successfully demonstrated qualities of self-reliance, ease of operation and thermal efficiency.

FIELD TEST OF AN IN STACK DIFFUSION CLASSIFIER ON AN AIRCRAFT ENGINE TEST CELL Final Report, Jun. - Dec. 1980
Dale A. Lundgren and Brian J. Hausknecht Tyndall AFB, Fla. Air Force Engineering and Services Center Apr. 1981 40 p
(Grant EPA-R-805762-02-2; AF Proj. 1900)
(AD-A113811; AFESC/ESL-TR-81-21) Avail: NTIS HC A03/MF A01 CSCL 14/2

An in-stack diffusion classifier was field tested at Tyndall Air Force Base, Florida. Particle size distribution measurements were made on the exhaust stream from the engine test cell while running a J75-P17 jet engine. Samples were collected at the test cell exhaust plane using a University of Washington in stack cascade impactor followed, in series, by an in stack diffusion classifier being developed at University of Florida. In addition, total particulate samples were obtained using absolute filters to determine particulate mass concentration in the exhaust gases. Opacity readings of the plume were also taken during sampling. The procedures to collect significant data and the general problems encountered to generate a reasonable estimate of jet exhaust aerosol size distribution using a diffusion classifier are described in this report.

PANEL OPTIMIZATION WITH INTEGRATED SOFTWARE (POIS), VOLUME 2. USER INSTRUCTIONS: ECHO AND RRSYS Final Report, Jun. 1976 - Oct. 1980
P. Stern, B. O. Almroth, and P. Stehlin Wright-Patterson AFB, Ohio AFWAL Mar. 1981 135 p refs
(Contract F33615-76-C-3105; AF Proj. 2307)
(AD-A112224; AFWAL-TR-81-3073-Vol-2) Avail: NTIS HC A07/MF A01 CSCL 01/3

Optimization of structural panels with respect to bifurcation buckling constraints tends to lead to imperfection sensitive panels. The panels may not represent least weight configurations if the influence of always present geometrical imperfections are taken into account. A software package, POIS (Panel Optimization with Integrated Software) was developed in response to this problem. Here user instructions are presented for Computer Program ECHO and RRSYS which are part of the POIS system. ECHO is a collection of computer programs for least weight design of stiffened structural panels subjected to multiple combinations of inplane loads. ECHO includes program modules for optimization of perfect panels and nonlinear static stress analysis of panels with random imperfections. The optimization problem is carried out as a constrained function minimization problem in which buckling loads, stress, and strain may be constraints. RRSYS is a program system for the nonlinear analysis of elastic structures by means of the Rayleigh-Ritz method. RRSYS is designed to analyze such diverse structural phenomena as collapse, linear and nonlinear bifurcation, vibrations and transient dynamic response.

RADIATION/CATALYTIC AUGMENTED COMBUSTION Final Report, 1 Jun. 1977 - 28 Feb. 1981
Moshe Lavid Jul. 1981 40 p refs
(Contract F49620-77-C-0085; AF Proj. 2308)
(AD-A112376; AFOSR-82-0132TR) Avail: NTIS HC A03/MF A01 CSCL 21/2

Two techniques for extending aircraft operational range are reported. They are radiative and catalytic augmentation techniques to enhance combustion initiation and reaction kinetics which restrict combustor operation via limits on flammability, flame propagation, ignition and stability. Both techniques demonstrated the capability to enhance combustion processes and to broaden normally encountered stability limits. The radiative technique under laboratory static conditions successfully ignited fuel air mixtures, and enhanced combustion processes, utilizing pulsed and continuous VUV light souces. Similarly, the catalytic technique provided efficient combustion under normally difficult fuel lean, low temperature, conditions. A complementary effort involves the development of analytical capability required for modeling the radiative and catalytic techniques. Radiative ignition and combustion enhancement tests were performed on gaseous mixtures under various static conditions. Successful radiative ignitions were obtained with pulsed and continuous VUV/UV light sources.

MODELING SOLID-FUEL RAMJET COMBUSTION INCLUDING RADIATION HEAT TRANSFER TO THE FUEL SURFACE Interim Report
Michael E. Metochianakis (Greek Air Force), William V. Goodwin, Uri Katz, and David W. Netzer Aug. 1981 50 p refs
(AD-A107441; NPS67-81-012) Avail: NTIS HC A03/MF A01 CSCL 21/5

Radiation heat transfer from soot in the flame zone to the fuel surface of a solid fuel ramjet was incorporated into an existing two-dimensional computer code. Improved prediction of the fuel regression pattern was obtained. Near-wall temperature measurements indicated that the model predicts too much turbulent mixing near the fuel surface.

EVALUATION OF PLASMA SOURCE SPECTROMETERS FOR THE AIR FORCE OIL ANALYSIS PROGRAM Interim Report, 30 Aug. 1977 - 30 Sep. 1980
Wendell E. Rhine, Costandy S. Saba, Robert E. Kauffman, John R. Brown, and Patricia S. Fair Wright-Patterson AFB, Ohio AFWAL Feb. 1982 354 p refs
(Contract F33615-76-C-5312; AF Proj. 2303)
(AD-A113809; AFWAL-TR-82-4017) Avail: NTIS HC A16/MF A01 CSCL 14/2

An investigation was conducted in order to evaluate two plasma source emission spectrometers for use in the Air Force Oil Analysis Program (OAP). The high temperatures of the plasma sources were expected to improve the Oil Analysis Program's capability to analyze wear metal particulates. The work is presented in two phases. Phase I of the work dealt with determining the capabilities of the two plasma instruments as well as the currently used OAP spectrometers. During this phase of the work the sample introduction systems were identified as the reason each instrument could not detect particles larger than 3-10 Microns. Phase 2 of the work dealt with optimizing the sample introduction systems so that particles could be more efficiently transported where they could be analyzed. The improved systems were capable of analyzing particles as large as 14-20 Microns.

N82-26201

Flight-test verification of a pictorial display for general aviation instrument approach
[NASA-TM-83305] N82-26288

Simulation report: Advanced display for complex flight trajectories
[AD-A111259] N82-26320

APPROXIMATION

Quasilinearization solution of the proportional navigation problem
[AD-A113668] N82-27273

ARC HEATING

Increased capabilities of the Langley Mach 7 Scramjet Test Facility
[AIAA PAPER 82-1240] A82-35080

AREA NAVIGATION

Navstar - Global Positioning System: A revolutionary capability
A82-37040

ARRAYS

Local heat transfer to staggered arrays of impinging circular air jets
[ASME PAPER 82-GT-211] A82-35401

ASPECT RATIO

Secondary flow effects and mixing of the wake behind a turbine stator
[ASME PAPER 82-GT-46] A82-35304

Development and application of a performance prediction method for straight rectangular diffuser
[ASME PAPER 82-GT-122] A82-35352

ASSEMBLIES

Advanced concepts for composite structure joints and attachment fittings. Volume 2: Design guide
[AD-A111106] N82-26280

ASSEMBLING
Assembly of aircraft instruments --- Russian book A82-36950

ASSESSMENTS
Reduced performance and increased cost warrant reassessment of the multiple stores ejector rack N82-27285 [AD-A112776]

ATMOSPHERIC EFFECTS
Aviation meteorology --- Russian book A82-36972

ATMOSPHERIC ELECTRICITY
Triggered lightning --- resulting from aircraft atmospheric electricity interactions A82-35727
Influence of meteorological processes on the verticality of electric fields N82-26897 [AD-A111549]
Proceedings of the 1st Annual Workshop on Aviation Related Electricity Hazards Associated with Atmospheric Phenomena and Aircraft Generated Inputs N82-27237 [AD-A107326]

ATMOSPHERIC MOISTURE
Aircraft measurements of icing in supercooled and water droplet/ice crystal clouds A82-36054

ATOMIZERS
Influence of airblast atomizer design features on mean drop size A82-38993 [AIAA PAPER 82-1073]
Smoke reduction in PJR-710 turbofan engines by an airblast combustor A82-35290 [ASME PAPER 82-GT-24]
Plain-jet airblast atomization of alternative liquid petroleum fuels under high ambient air pressure conditions A82-35293 [ASME PAPER 82-GT-32]
Atomization quality of twin fluid atomizers for gas turbines A82-35314 [ASME PAPER 82-GT-61]

ATOMIZING
The Schladitz fuel injector: An initial performance evaluation without burning N82-27315 [AD-A113612]

ATTACK AIRCRAFT
Mission effectiveness of the AV-8B Harrier 2 could be improved if actions are taken now N82-26284 [AD-A111878]
Preplanned product improvement and other modification strategies: Lessons from past aircraft modification programs N82-27220 [AD-A113599]
Impact of Advanced Avionics Technology and Ground Attack Weapon Systems N82-27293 [AGARD-CP-306]
Impact of advanced avionics and munitions technology on ground attack weapons systems in night and adverse weather conditions N82-27294
Pave Mover aided integrated strike avionics system N82-27298
Adaptive multifunction sensor concept for air-ground missions N82-27299
Attack and en route avionics for in-weather operations N82-27300
Weapon system of a future attack aircraft N82-27301

ATTITUDE INDICATORS
Simulation report: Advanced display for complex flight trajectories N82-26320 [AD-A111259]
Torsional stiffness element based on cobalt-samarium magnets --- for a turn and bank indicator N82-27292 [BMFT-FB-W-81-044]

AUTOMATED EN ROUTE ATC
Scenarios for evolution of air traffic control N82-27270 [AD-A112566]

AUTOMATED RADAR TERMINAL SYSTEM
Comparison between the surveillance performances of the Air Traffic Control Radar Beacon System mode of the Mode S and the Automated Radar Terminal System N82-26273 [AD-A111733]

AUTOMATIC CONTROL
Quasilinearization solution of the proportional navigation problem N82-27273 [AD-A113660]

AUTOMATIC FLIGHT CONTROL
Lightning simulation and testing A82-35783
Formal specification and mechanical verification of SIFT - A fault-tolerant flight control system A82-37486
Rotor state estimation for rotorcraft A82-37704 [AHS PREPRINT 81-11]
Integrated flight trajectory control N82-26319 [AD-A110998]

AUTOMATIC GAIN CONTROL
Joint University Program Air for Transportation Research, 1981 N82-26199 [NASA-CP-2224]
A Loran-C prototype navigation receiver for general aviation N82-26207
Commutated automatic gain control system N82-26209

AUTOMATIC PILOTS
A gust damper --- for light passenger aircraft A82-37127

AUTOMATIC TEST EQUIPMENT
A laboratory mock-up ultrasonic inspection system for composites A82-35256

AUTOMOBILE ENGINES
Ceramic components for automotive and heavy duty turbine engines - CATE and AGT 100 A82-35432 [ASME PAPER 82-GT-253]

AVIONICS
Integrated aircraft avionics and powerplant control and management systems A82-35385 [ASME PAPER 82-GT-165]
Static charging and its effects on avionic systems A82-35732
The computerized cockpit for the one-man crew A82-36937
Life-cycle-cost analysis of the microwave landing system ground and airborne systems N82-26266 [AD-A110909]
Tanker Avionics/Aircrew Complement Evaluation (TAACE). Phase 1: Simulation evaluation. Volume 1: Results N82-26290 [AD-A110956]
Tanker Avionics/Aircrew Complement Evaluation (TAACE). Phase 1: Simulation evaluation. Volume 2: Crew system design N82-26291 [AD-A110954]
Integrated flight trajectory control N82-26319 [AD-A110998]
Bibliography of Lewis Research Center technical publications announced in 1981 N82-27191 [NASA-TM-82838]
Impact of Advanced Avionics Technology and Ground Attack Weapon Systems N82-27293 [AGARD-CP-306]
Impact of advanced avionics and munitions technology on ground attack weapons systems in night and adverse weather conditions N82-27294
Air-ground attack: Area of research for airborne systems N82-27295
A planning system for F-16 air-to-surface missions N82-27297
Pave Mover aided integrated strike avionics system N82-27298
Adaptive multifunction sensor concept for air-ground missions N82-27299
Attack and en route avionics for in-weather operations N82-27300
Protection of electrical systems from EM hazards: Design guide N82-27659 [AD-A112707]
Assessment of lightning simulation test techniques, part 1 N82-27663 [AD-A112626]

AXIAL FLOW TURBINES
A comprehensive method for preliminary design optimization of axial gas turbine stages A82-35091 [AIAA PAPER 82-1264]

Practical application of a computerized flight by flight fatigue test system
A82-37768
Design of a data acquisition and reduction system for fatigue testing
[AD-A110612] N82-26720
FAULT TOLERANCE
Formal specification and mechanical verification of SIFT - A fault-tolerant flight control system
A82-37446
Reliability design study for a fault-tolerant electronic engine control
[AIAA PAPER 82-1129] A82-37689
Control optimization, stabilization and computer algorithms for aircraft applications
[NASA-CR-169015] N82-27009
FEEDBACK CONTROL
Simplified digital design tools
A82-37034
A simple system for helicopter Individual-Blade-Control and its application to stall flutter suppression
A82-37765
Design and evaluation of a state-feedback vibration controller
[AHS PREPRINT 81-10] A82-37783
Rotor state estimation for rotorcraft
[AHS PREPRINT 81-11] A82-37784
A simple system for helicopter individual-blade-control and its application to stall-induced vibration alleviation
[AHS PREPRINT 81-12] A82-37785
Considerations of open-loop, closed-loop, and adaptive multicyclic control systems
[AHS PREPRINT 81-13] A82-37786
Use of entire eigenstructure assignment with high-gain error-actuated flight control systems
[AD-A111098] N82-26318
Marine Air Traffic Control and Landing System (MATCALS) investigation
[AD-A107384] N82-27260
FERROGRAPHY
Mechanical wear assessment of helicopter engines by ferrography
[AD-A110772] N82-26305
FIBER OPTICS
Air data measurement using distributed processing and fiber optics data transmission
N82-26214
FIBER REINFORCED COMPOSITES
Geometrical aspects of the tribological properties of graphite fiber reinforced polyimide composites
[ASLE PREPRINT 82-AM-5A-2] A82-37855
Advanced concepts for composite structure joints and attachment fittings. Volume 2: Design guide
[AD-A111106] N82-26280
Fuselage structure using advanced technology fiber reinforced composites
[NASA-CASE-LAR-11688-1] N82-26384
FIELD OF VIEW
Wide field of view laser beacor system for three dimensional aircraft range measurements
N82-26216
Wide angle raster head up display design and application to future single seat fighters
N82-27304
FIGHTER AIRCRAFT
A methodology for planning a cost effective engine development --- for fighter aircraft
[AIAA PAPER 82-1140] A82-35024
Propulsion system requirements for advanced fighter aircraft
[AIAA PAPER 82-1143] A82-35025
The F404 development program - A new approach
[AIAA PAPER 82-1180] A82-35045
Control of gas turbine power transients for improved turbine airfoil durability
[AIAA PAPER 82-1182] A82-35047
Individual bypass throttling in fighter engines
[AIAA PAPER 82-1285] A82-35100
Status report of the USAF's Engine Model Derivative Program
[ASME PAPER 82-GT-183] A82-35391
Cycle considerations for tactical fighters in the early 1990's
[ASME PAPER 82-GT-259] A82-35436
Extension of FLO codes to transonic flow prediction for fighter configurations
A82-35564
Thrust reverser induced flow interference on tactical aircraft stability and control
[AIAA PAPER 82-1133] A82-37693
Advanced nozzle integration for air combat fighter application
[AIAA PAPER 82-1135] A82-37694
Opportunities exist to achieve greater standardization of aircraft and helicopter seats
[AD-A111718] N82-26259
Navy's F/A-18 expected to be an effective performer but problems still face the program
[AD-A111877] N82-26281
Life and Utilization Criteria Identification In Design (LUCID), volume 1
[AD-A111939] N82-26309
Life and Utilization Criteria Identification In Design (LUCID), volume 2
[AD-A111940] N82-26310
Aviation Materiel Combat Ready In-Country (AMCRIC)
[AD-A107451] N82-27283
Comparison of different fighter aircraft load spectra
[FFA-TN-1982-02] N82-27288
Advanced technology and fighter cockpit design: Which drives which?
N82-27302
FILM COOLING
Effect of crossflows on the discharge coefficient of film cooling holes
[ASME PAPER 82-GT-147] A82-35371
The effect of temperature ratios on the film cooling process
[ASME PAPER 82-GT-305] A82-35470
Heat transfer in turbines
[AD-A111584] N82-26307
FINITE ELEMENT METHOD
Engine dynamic analysis with general nonlinear finite element codes. II - Bearing element implementation, overall numerical characteristics and benchmarking
[ASME PAPER 82-GT-292] A82-35462
A finite element analysis of coupled rotor fuselage vibration
[AHS PREPRINT 81-21] A82-37792
Static and aeroelastic optimization of aircraft
A82-37945
FIRE CONTROL
Impact of Advanced Avionics Technology and Ground Attack Weapon Systems
[AGARD-CP-306] N82-27293
A planning system for F-16 air-to-surface missions
N82-27297
FIRE FIGHTING
Briefs of accidents involving aerial application operations, U.S. general aviation, 1979
[PB82-138983] N82-27256
FIRE PREVENTION
Aircraft fire safety research with antimisting fuels - Status report
[AIAA PAPER 82-1235] A82-35076
FLAME HOLDERS
Experimental study of the effects of secondary air on the emissions and stability of a lean premixed combustor
[AIAA PAPER 82-1072] A82-34992
FLAME PROPAGATION
Models for a turbulent premixed dump combustor
[AIAA PAPER 82-1261] A82-37709
FLASH LAMPS
A laboratory evaluation of the suitability of a xenon flashtube signal as an aid-to-navigation
[AD-A110729] N82-26265
FLASHING (VAPORIZING)
Experimental study of external fuel vaporization
[ASME PAPER 82-GT-59] A82-35312
Investigation of spray characteristics for flashing injection of fuels containing dissolved air and superheated fuels
[NASA-CR-3563] N82-26295
FLAT PLATES
Local heat transfer to staggered arrays of impinging circular air jets
[ASME PAPER 82-GT-211] A82-35401
A research program to reduce interior noise in general aviation airplanes. Influence of depressurization and damping material on the noise reduction characteristics of flat and curved stiffened panels
[NASA-CR-169035] N82-27088

FLEXIBLE BODIES
Transient vibration of high speed lightweight rotor due to sudden imbalance [ASME PAPER 82-GT-231] A82-35413
Experimental evaluation of squeeze film supported flexible rotors [ASME PAPER 82-GT-233] A82-35415
FLIGHT CHARACTERISTICS
Airworthiness and flight characteristics test of an OH-58C configured to a Light Combat Helicopter (LCH) [AD-A112581] N82-26286
FLIGHT CONDITIONS
Aviation meteorology --- Russian book A82-36972
Briefs of fatal accidents involving weather as a cause/factor, U.S. general aviation, 1979 [PB82-138934] N82-27248
Impact of advanced avionics and munitions technology on ground attack weapons systems in night and adverse weather conditions N82-27294
Attack and en route avionics for in-weather operations N82-27300
Weapon system of a future attack aircraft N82-27301
FLIGHT CONTROL
Use of entire eigenstructure assignment with high-gain error-actuated flight control systems [AD-A111098] N82-26318
Scenarios for evolution of air traffic control [AD-A112566] N82-27270
Development of low-order model of an X-wing aircraft by system identification [AD-A113760] N82-27286
Quiet Short-Haul Research Airplane (QSRA) model select panel functional description [NASA-TM-84243] N82-27319
Reliability and maintainability analysis of fluidic back-up flight control system and components [AD-A110496] N82-27320
Digital command augmentation for lateral directional aircraft dynamics [AD-A107264] N82-27321
Notes on lateral-directional pilot induced oscillations [AD-A113996] N82-27322
FLIGHT CREWS
Army helicopter crew seat vibration - Past performance, future requirements [AHS PREPRINT 81-3] A82-37779
Update of the summary report of 1977-1978 task force on aircrew workload [AD-A112547] N82-26258
Tanker Avionics/Aircrew Complement Evaluation (TAACE). Phase 1: Simulation evaluation. Volume 1: Results [AD-A110956] N82-26290
Tanker Avionics/Aircrew Complement Evaluation (TAACE). Phase 1: Simulation evaluation. Volume 2: Crew system design [AD-A110954] N82-26291
FLIGHT HAZARDS
STOL aircraft response to turbulence generated by a tall upwind building A82-35821
Briefs of fatal accidents involving weather as a cause/factor, U.S. general aviation, 1979 [PB82-138934] N82-27248
FLIGHT INSTRUMENTS
Tanker Avionics/Aircrew Complement Evaluation (TAACE). Phase 1: Simulation evaluation. Volume 2: Crew system design [AD-A110954] N82-26291
FLIGHT PATHS
Electric field detection and ranging of aircraft A82-37377
Simulation report: Advanced display for complex flight trajectories [AD-A111259] N82-26320
A result in the theory of spiral search [AD-A112481] N82-27262
AUTOPILOT: A distributed planner for air fleet control [AD-A107139] N82-27269
FLIGHT PLANS
Dynamic scheduling of runway operations N82-26200
The Flight Service Automation System (FSAS) system benchmark. Volume 1: Summary, introduction and concepts [PB82-143538] N82-27277
The Flight Service Automation System (FSAS) system benchmark. Volume 2: The model of the application [PB82-143546] N82-27278
The Flight Service Automation System (FSAS) system benchmark. Volume 3: The vendor interface package [PB82-143553] N82-27279
FLIGHT SAFETY
The direct effects of lightning on aircraft A82-35730
A gust damper --- for light passenger aircraft A82-37127
Proposed research tasks for the reduction of human error in naval aviation mishaps [AD-A112339] N82-27241
FLIGHT SIMULATION
Evaluation of a simplified gross thrust calculation method for a J85-21 afterburning turbojet engine in an altitude facility [AIAA PAPER 82-1044] A82-34978
Application of high bypass turbofan computer simulation to flight and test data processing [ASME PAPER 82-GT-141] A82-35366
Integrated flight trajectory control [AD-A110998] N82-26319
Simulation report: Advanced display for complex flight trajectories [AD-A111259] N82-26320
Comparison of different fighter aircraft load spectra [FFA-TN-1982-02] N82-27288
FLIGHT SIMULATORS
Justification for, and design of, an economical programmable multiple flight simulator A82-36969
Optimal placement model for the B-52G weapons system trainer [AD-A110977] N82-26323
Visual technology research simulator, visual and motion system dynamics [AD-A111801] N82-26325
System Description-Aviation Wide-Angle Visual System (AWAVS) computer image [AD-A111800] N82-27323
Reports by Systems Technology, Inc., in support of carrier-landing research in the visual technology research simulator [AD-A112466] N82-27324
Advanced training techniques using computer generated imagery [AD-A111979] N82-28007
Computer image generation: Advanced visual/sensor simulation [AD-A107098] N82-28016
FLIGHT TESTS
Selected results of the F-15 propulsion interactions program [AIAA PAPER 82-1041] A82-34976
Evaluation of a simplified gross thrust calculation method for a J85-21 afterburning turbojet engine in an altitude facility [AIAA PAPER 82-1044] A82-34978
In-flight acoustic results from an advanced-design propeller at Mach numbers to 0.8 [AIAA PAPER 82-1120] A82-35017
T700 - Modern development test techniques, lessons learned and results [AIAA PAPER 82-1183] A82-35048
Certification of an airborne Loran-C navigation system A82-35876
The PATRIOT Radar in tactical air defense A82-37031
Boeing's new transports in a flight-test marathon A82-37493
Flight evaluation of a digital electronic engine control system in an F-15 airplane [AIAA PAPER 82-1080] A82-37683
Practical application of a computerized flight by flight fatigue test system A82-37768

MILITARY TECHNOLOGY
A methodology for planning a cost effective engine development --- for fighter aircraft
[AIAA PAPER 82-1140] A82-35024
Air Force Academy aeronautics digest: Spring/summer 1981
[AD-A112421] N82-27216
MINERALS
Strategic materials - Technological trends
A82-37972
MISALIGNMENT
The effect of journal misalignment on the oil-film forces generated in a squeeze-film damper
[ASME PAPER 82-GT-285] A82-35457
MISSILE CONTROL
Quasilinearization solution of the proportional navigation problem
[AD-A113668] N82-27273
MISSILE TRACKING
Application of adaptive estimation to target tracking
[AD-A112036] N82-26272
Automatic handoff of multiple targets
[AD-A107490] N82-27561
MISSILE TRAJECTORIES
Quasilinearization solution of the proportional navigation problem
[AD-A113668] N82-27273
MISSILES
Proceedings of the 12th Navy Symposium on Aeroballistics, volume 1
[AD-A111763] N82-27225
Proceedings of the 12th Navy Symposium on Aeroballistics, volume 2
[AD-A111783] N82-27312
MISSION PLANNING
Mission effectiveness of the AV-8B Harrier 2 could be improved if actions are taken now
[AD-A111878] N82-26284
A planning system for F-16 air-to-surface missions
N82-27297
MIXERS
Experimental performance evaluation of 'ventilated mixers' - A new mixer concept for high bypass turbofan engines
[AIAA PAPER 82-1136] A82-37695
MOBILITY
Cold regions testing of an air transportable shelter
[AD-A107131] N82-27325
MOIRE INTERFEROMETRY
Analysis of rotating structures using image derotation with multiple pulsed lasers and moire techniques
A82-36999
MOLDS
Efficient part removal processes --- from molds
A82-37097
MOORING
Preliminary study of ground handling characteristics of Buoyant Quad Rotor (BQR) vehicles
[NASA-CR-166130] N82-26220
MOTION SIMULATORS
Visual technology research simulator, visual and motion system dynamics
[AD-A111801] N82-26325
MULTIPHASE FLOW
A mixed-flow cascade passage design procedure based on a power series expansion
[ASME PAPER 82-GT-121] A82-35351

N

NACELLES
Investigation of subsonic nacelle performance improvement concept
[AIAA PAPER 82-1042] A82-37676
Performance deterioration due to acceptance testing and flight loads; JT9D jet engine diagnostic program
[NASA-CR-165572] N82-27309
NAP-OF-THE-EARTH NAVIGATION
An automatic map reader suitable for use in helicopters
A82-37775
NASA PROGRAMS
NASA ECI programs - Benefits to Pratt and Whitney engines
[ASME PAPER 82-GT-272] A82-35448
Summary and recent results from the NASA advanced High Speed Propeller Research Program
[NASA-TM-82891] N82-26219
NASTRAN
A unified approach to helicopter NASTRAN modeling
[AHS PREPRINT 81-22] A82-37793
Investigation of an improved structural model for damaged T-38 horizontal stabilizer flutter analysis using NASTRAN
[AD-A111095] N82-26316
NATIONAL AVIATION SYSTEM
Airfield and airspace capacity/delay policy analysis
[AD-A110777] N82-26326
NAVIER-STOKES EQUATION
Analysis of two-dimensional internal flows using a primitive-variable relaxation Navier-Stokes procedure
[AIAA PAPER 82-1083] A82-34998
The numerical solution of the Navier-Stokes equations for incompressible turbulent flow over airfoils
[AD-A111279] N82-26612
NAVIGATION
Visual technology research simulator, visual and motion system dynamics
[AD-A111801] N82-26325
Quasilinearization solution of the proportional navigation problem
[AD-A113668] N82-27273
NAVIGATION AIDS
Wide field of view laser beacon system for three dimensional aircraft range measurements
N82-26216
Magnetic heading reference
[NASA-CASE-LAR-12638-1] N82-26260
Study of the global positioning system for maritime concepts/applications: Study of the feasibility of replacing maritime shipborne navigation systems with NAVSTAR
[NASA-CR-169031] N82-26263
A laboratory evaluation of the suitability of a xenon flashtube signal as an aid-to-navigation
[AD-A110729] N82-26265
NAVIGATION INSTRUMENTS
PPOD Programmable pilot-oriented display --- air navigation
N82-26201
NAVIGATION SATELLITES
Prospects for Navsat - A future worldwide civil navigation-satellite system
A82-36047
NAVSTAR SATELLITES
FAA tests on the Navstar GPS Z-set
A82-37039
Navstar - Global Positioning System: A revolutionary capability
A82-37040
Study of the global positioning system for maritime concepts/applications: Study of the feasibility of replacing maritime shipborne navigation systems with NAVSTAR
[NASA-CR-169031] N82-26263
NAVY
Proceedings of the 12th Navy Symposium on Aeroballistics, volume 1
[AD-A111763] N82-27225
Proceedings of the 12th Navy Symposium on Aeroballistics, volume 2
[AD-A111783] N82-27312
NICKEL ALLOYS
Development of hybrid gas turbine bucket technology
[ASME PAPER 82-GT-94] A82-35337
NIGHT FLIGHTS (AIRCRAFT)
Impact of advanced avionics and munitions technology on ground attack weapons systems in night and adverse weather conditions
N82-27294
NIGHT VISION
Helicopter night vision system simulation evaluation
[AD-A110505] N82-26292
NITROGEN COMPOUNDS
Effect of some nitrogen compounds thermal stability of jet A
[NASA-TM-82908] N82-27519
NOISE (SOUND)
Wide field of view laser beacon system for three dimensional aircraft range measurements
N82-26216

NOISE POLLUTION
Transportation noise, its impact, planning and regulation N82-27064
[S-258]
NOISE PREDICTION (AIRCRAFT)
Interior noise considerations for advanced high-speed turboprop aircraft A82-35010
[AIAA PAPER 82-1121]
Development and validation of preliminary analytical models for aircraft interior noise prediction A82-38077

NOISE REDUCTION
Interior noise considerations for advanced high-speed turboprop aircraft A82-35010
[AIAA PAPER 82-1121]
Model test and full scale checkout of dry-cooled jet runup sound suppressors A82-35079
[AIAA PAPER 82-1239]
NASA research in supersonic propulsion: A decade of progress N82-26300
[NASA-TM-82862]
A research program to reduce interior noise in general aviation airplanes. Influence of depressurization and damping material on the noise reduction characteristics of flat and curved stiffened panels N82-27088
[NASA-CR-169035]
Marine Air Traffic Control and Landing System (MATCALS) investigation N82-27260
[AD-A107304]
Aircraft noise reduction N82-27281

QCSEE under-the-wing engine acoustic data N82-27311
[NASA-TM-82691]
Airbus Industrie and community noise N82-27865

NOISE SPECTRA

EFFECT OF SOME NITROGEN COMPOUNDS THERMAL STABILITY OF JET A

Albert C. Antoine Jun. 1982 20 p refs
(NASA-TM-82908; NAS 1.15:82908) Avail: NTIS HC A02/MF A01 CSCL 21D

The effect of known concentrations of some nitrogen containing compounds on the thermal stability of a conventional fuel, namely, Jet A was investigated. The concentration range from 0.01 to 0.1 wt% nitrogen was examined. Solutions were made containing, individually, pyrrole, indole, quinoline, pyridine, and 4 ethylpyridine at 0.01, 0.03, 0.06, and 0.1 wt% nitrogen concentrations in Jet A. The measurements were all made by using a standard ASTM test for evaluating fuel thermal oxidation behavior, namely, ASTM D3241, 'thermal oxidation stability of turbine fuels (JFTOT procedure).' Measurements were made at two temperature settings, and 'breakpoint temperatures' were determined. The results show that the pyrrole and indole solutions have breakpoint temperatures substantially lower than those of the Jet A used. S.L.

EVALUATION OF HYDROCRACKING CATALYSTS FOR CONVERSION OF WHOLE SHALE OIL INTO HIGH YIELDS OF JET FUELS Final Report, Dec. 1979 - Oct. 1981

A. M. Tait and A. L. Hensley Wright-Patterson AFB, Ohio AFWAL Oct. 1981 196 p refs
(Contract F33615-79-C-2095; AF Proj. 3048)
(AD-A112820; M81-65; AFWAL-TR-81-2098) Avail: NTIS HC A09/MF A01 CSCL 21/4

A catalyst development and screening program has led to a formulation capable of upgrading whole shale oil into high yields of military jet fuel in a single operation. The catalyst is multifaceted in its functionality in that it sequentially saturates, denitrogenates, and hydrocracks the feedstock in the presence of high levels of contaminants, such as organic nitrogen compounds and ammonia, while maintaining a high selectivity towards jet-fuel, boiling range material. The catalyst, developed by optimization of both chemical and physical properties, consists of 1.5% cobalt oxide, 10% chromium oxide, and 15% molybdenum oxide on a support of 50% ultrastable molecular sieve in alumina. The effectiveness of the catalyst for the direct upgrading of an Occidental whole shale oil was demonstrated in a 100-day test. The feed, containing approximately 15 weight percent material boiling within the range for JP-4 and containing 13,000 ppm nitrogen, was upgraded to a water-white product containing 1 to 3 ppm nitrogen and approximately 75% JP-4 material. The hydrogen consumption required for this level of upgrading and conversion was approximately 1800 SCFB. The catalyst developed represents an advance in shale oil upgrading technology over more conventional petroleum-based technology. Author (GRA)

COMMERCIAL AIRCRAFT AIRFRAME FUEL SYSTEMS SURVEYS Interim Report, Oct. 1980 - Oct. 1981

P. G. Weitz Atlantic City FAA Feb. 1982 55 p refs
(Contract DTFA03-80-C-0080)
(AD-A112241; E-2304; FAA-CT-82/12) Avail: NTIS HC A04/MF A01 CSCL 20/4

A selection of commercial aircraft airframe fuel systems has been studied to determine areas where incompatibility with antimisting kerosene fuel (AMK) may exist. Incompatibility can be due to reduced fuel system component performance with AMK or shear degradation of the AMK by the fuel system components. Survey results, to date, indicate that potential component performance problems with AMK are more significant than loss of AMK flammability protection due to shear degradation. Components of interest include ejector pumps, fuel filters, and auxiliary power units. The solubility of water in AMK and its effect on fuel system performance under actual operating conditions is also of major importance. Author (GRA)

AN INVESTIGATION OF ENGINE AND TEST CELL OPERATING CONDITIONS ON THE EFFECTIVENESS OF SMOKE SUPPRESSANT FUEL ADDITIVES M.S. Thesis

Donald Wendell Thornburg Dec. 1981 103 p refs
(Contract N6237681-WR-00014)
(AD-A112800) Avail: NTIS HC A06/MF A01 CSCL 13/2

Tests were conducted in a one-eighth scale turbojet test cell with a ramjet type combustor to investigate the effects of fuel additives on smoke reduction. Particle size and mass concentrations were determined at the engine and stack exhaust using three wavelength optical detector systems. Particulate samples were also collected at the engine exhaust and analyzed with a scanning electron microscope. Combustor temperature and fuel additives were found to significantly affect particulate mass concentrations emitted from the engine while particle size appeared to be unaffected. No significant changes in the particulate size or mass occurred from the engine exhaust to the stack exhaust. The optical determination of exhaust mean particulate size/mass concentration with three wavelength optical detector systems appears to be a good and reasonably accurate technique for evaluating the effects of engine and test cell operating conditions and fuel composition changes on the emitted particulates. SPIRAL SLOTTED PHASED ANTENNA ARRAY Patent

Haynes Ellis, Jr., inventor (to NASA) (Rockwell International Corp., Downey, Calif.) Issued 9 Feb. 1982 7 p Filed 25 Jul. 1980 Supersedes N80-29543 (18 - 20, p 2685) Sponsored by NASA
(NASA-Case-MSC-18532-1; US-Patent-4,315,266;
US-Patent-Appl-SN-172099; US-Patent-Class-343-895;
US-Patent-Class-343-789) Avail: US Patent and Trademark Office CSCL 20N

A flush mounting, cavity-backed, dual orthogonal slot antenna for aircraft and space vehicles is described. Improved radiation pattern characteristics are obtained by making the spiral slot pattern elliptical in the aperture plane. A cavity and a flanged aperture plate are configured such that one slot pair is orthogonal with respect to another slot pair within the aperture plate. Coaxial split-tube baluns are used to drive the junctions between corresponding slot pairs. An optional cavity dielectric is provided and a drive coupling arrangement includes a four port comparator hybrid having sum and difference ports respectively, for alternate excitation to produce a single lobe or a double lobe pattern with null. Switching apparatus is provided to connect a common terminal to either of the ports.

AUTOMATIC HANDOFF OF MULTIPLE TARGETS Final Technial Report, 10 Oct. 1980 - 14 Sep. 1981

J. S. Boland, III, H. S. Ranganath, and D. V. Satish Chandra Redstone Arsenal, Ala. Army Missile Command 14 Sep. 1981 166 p refs
(Contract DAAH01-80-C-0258)
(AD-A107490; AD-E950176; DRSMI/RG-CR-81-4) Avail: NTIS HC A08/MF A01 CSCL 17/5

In order to fully utilize the potential of the 'fire and forget' class of helicopter-borne missiles, it is necessary to solve the technical problems associated with acquiring and handing off multiple targets from a precision pointing and tracking system (PTS) to several missile seekers simultaneously or almost so in a short period of time. The multiple target problem is that of locating targets and missile seeker aim points within the PTS field of view, deciding which target is to be assigned to each missile, generating error signals to the torquers in order to slew the missile LOS such that its assigned target is in the center of its FOV, and initiating automatic seeker tracking. The task of locating a given smaller image within a larger image is known as 'image registration'. A detailed comparison of the important multiple image registration methods based on the number of arithmetic operations for software implementation and the complexity of hardware for real time implementation is presented.

New methods of accomplishing multiple image registration which are computationally more efficient than the most commonly used template matching techniques (correlation and sequential similarity detection algorithm) are described. Several methods are compared with respect to hardware requirements and speed of computation. Author (GRA)

SOFTWARE FUNCTIONAL DESCRIPTION OF MASS WEATHER DISSEMINATION SYSTEM EXPLORATORY ENGINEERING MODEL Final Report
Louis Delemarre Feb. 1982 52 p
(FAA Proj. 131-401-835)
(AD-A112706; DOT/FAA/CT-81/33; FAA-RD-82-1) Avail: NTIS HC A04/MF A01 CSCL 17/2

This report describes the Mass Weather Dissemination System Exploratory Engineering Model software currently being evaluated in the Flight Service Station Engineering Laboratory. The object of this effort is to investigate, through development, test and evaluation, the application of digital technology to the dissemination of meteorological and aeronautical information. The prototype model is a fully-automated system designed to transfer a significant amount of workload from the flight service station specialist to system hardware/software in order to provide better service to the flying public. ADVANCED MICROSTRIP ANTENNA DEVELOPMENTS. VOLUME 2: MICROSTRIP GPS ANTENNAS FOR GENERAL AVIATION AIRCRAFT Final Report, Apr. 1979 - Jun. 1980
Gary G. Sanford and Brian D. Gross Mar. 1982 48 p
(Grant DOT-TSC-1397-1)
(AD-A113620; FAA-EM-80-12-2; TSC-FAA-80-15-Vol-2) Avail: NTIS HC A03/MF A01 CSCL 09/5

This report describes the application of microstrip antenna technology to the design of general aviation (G/A) aircraft antennas for use with the Global Positioning System (GPS). For most G/A aircraft, only single frequency operation will be required. However, air-carrier and some large corporate aircraft may make use of dual-frequency operation. For this reason, some dual-frequency designs have been investigated. The main effort was given to the design of antennas with broad beamwidths which could be switched or steered to compensate for aircraft maneuvers, with the goal of maintaining near-hemispherical carriage in flight. A hybrid microstrip crossed-slot and sleeve-dipole element used with a suitable combining network gives a suitable, controllable broad-beam pattern. This element and its performance are described. In addition, radiation patterns are presented using scale-model aircraft and simple crossed-slot antennas. Author (GRA)

INFLUENCE OF CONTRAST ON SPATIAL PERCEPTION IN TV DISPLAY OF MOVING IMAGES [EINFLUSS DES KONTRASTES AUF DIE RAUMWAHRNEHMUNG BEI TV -FLUGAUSSENSICHT- DARSTELLUNGEN]
H. Heising Sep. 1981 80 p refs In GERMAN; ENGLISH summary
(FB-50) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 10

A low cost visual simulation system was developed which involves a hybrid computer controlled transformation of perspective on a raster scan TV display. It is applicable to a wide range of simulation tasks, including training and research, but is especially useful in facilitating detection of moving objects and reducing frame rate in RPV applications with a number of advantages, e.g., reduction of bandwidth and improved protection against jamming. Because of the perspective transformation in TV raster scan, a change of contrast can occur during the display of moving images. Therefore, it is of interest to know the effect of this contrast change on human spatial perception. The investigations undertaken led to the conclusion that the physical contrast in the ratio range of l:ll to 1:25 (by a medium illuminance of 7 cd/sqm at the white parts of the picture) does not influence human distance and height judgments. The effects of lightning strikes on aircraft and the resulting transients coupled onto the electrical systems were investigated. The historical background and overall scope of the study are presented. The lightning threat is defined and electrical system math models are developed. The normal design of aircraft for inherent hardness is evaluated. Wire routing, equipment location, fiber optics, threat level comparisons and the evaluation of specific electrical circuits are assessed. The effects of using add on protection to suppress induced transients on the electrical system are analyzed. Protection schemes include cable shielding, linear protection devices, nonlinear protection devices and conductive coatings applied to the aircraft skin. The design guide provides the most appropriate lightning hardening techniques is summarized. Reliability/maintainability, system safety and design to cost considerations are discussed. Protection criteria to develop a lightning tolerant electrical system are included. E.A.K.

PROTECTION OF ELECTRICAL SYSTEMS FROM EM HAZARDS: DESIGN GUIDE Interim Report, Jun. 1979 - Oct. 1981
David L. Sommer Wright-Patterson AFB, Ohio AFWAL Sep. 1981 211 p refs
(Contract F33615-79-C-2006)
(AD-A112707; D180-26154-3; AFWAL-TR-81-2118) Avail: NTIS HC A10/MF A01 CSCL 01/3

This report contains results of a two-phase study program investigating the effects of lightning strikes on aircraft and the resulting transients coupled on to the electrical systems. The design guide contains the historical background and the lighting threat assessment in the sections 1 and 2. Section 3 of the design guide contains the techniques for inherent hardening against the lightning strike electromagnetic energy. Section of 4 of the design guide provides two methods for evaluating electrical systems to determine the levels of transients that can be induced. The first method allows an electrical systems designer to make a preliminary assessment of the lightning strike threats. The second method allows a more detailed evaluation using a computer program called PRESTO. Section 5 identifies and examines the various military specifications covering the transients that existing electrical equipment has to withstand. Using this information, add-on protection hardware and hardening techniques were evaluated in Sections 6 and 7. Section 8 provides examples for selecting hardening techniques for advanced electrical systems. Sections 9, 10, and 11 discuss the reliability/maintainability, system safety and Design to Cost considerations in selection of the appropriate hardening techniques. Author (GRA)

ASSESSMENT OF LIGHTNING SIMULATION TEST TECHNIQUES, PART 1 Final Report, Jul. 1980 - Oct. 1981
W. G. Butters, D. W. Clifford, K. P. Murphy, and K. S. Zeisel Oct. 1981 128 p refs Sponsored in part by Navy
(Contract F33615-80-C-3406; AF Proj. 2402)
(AD-A112626; AFWAL-TR-81-3075-Pt-1) Avail: NTIS HC A07/MF A01 CSCL 14/2

The program objective was to assess the current pulse and shock-excitation lightning simulation test techniques. The current pulse test technique applies a pulsed current stimulus to the test article, while the shock-excitation technique first charges the test article to a high voltage which then produces a rapid voltage/current pulse on the test article as the spark gap (between the test article and the return conductors) breaks down. Direct comparisons of the induced voltage response on interior circuits were made for the two test techniques. The interior circuits were high-impedance differential wire pairs typical of many flight-critical in advanced aircraft. The program was divided into three tasks: (1) an analytical task to model both test techniques to provide a theoretical base, (2) comparative tests using an aluminum cylinder and simple interior circuits that were readily modeled, and (3) comparative tests on the flight control circuits of a full-scale YF-16 fighter aircraft. The cylinder test configuration was modeled as two coupled transmission line circuits. The generator, cylinder, return lines, and the output configuration

Heat transfer optimised turbine rotor blades - An experimental study using transient techniques A82-35469
[ASME PAPER 82-GT-304]
Aerodynamic performance of high turning core turbine vanes in a two-dimensional cascade A82-37716
[AIAA PAPER 82-1288]
Thrust reverser for a long duct fan engine --- for turbofan engines N82-26293
[NASA-CASE-LEW-13199-1]
Blade tip gap effects in turbomachines: A review N82-26308
[AD-A111892]
CASCADE WIND TUNNELS
Heat transfer measurements of a transonic nozzle guide vane A82-35426
[ASME PAPER 82-GT-247]
Aerodynamic performance of high turning core turbine vanes in a two-dimensional cascade A82-37716
[AIAA PAPER 82-1288]
CASING
Influence of casing treatment on the operating range of axial compressors A82-35340
[ASME PAPER 82-GT-103]
Effect of the rear stage casing treatment on the overall performance of a multistage axial-flow compressor A82-35344
[ASME PAPER 82-GT-110]
CATALYSTS
Evaluation of hydrocracking catalysts for conversion of whole shale oil into high yields of jet fuels N82-27523
[AD-A112820]
CATALYTIC ACTIVITY
Radiation/catalytic augmented combustion N82-27434
[AD-A112376]
CATHODE RAY TUBES
Justification for, and design of, an economical programmable multiple flight simulator A82-36969
CAUSES
Briefs of accidents, involving corporate/executive aircraft, U.S. general aviation, 1979 N82-27245
[PB82-138967]
Briefs of accidents involving missing and missing later recovered aircraft, U.S. general aviation, 1979 N82-27246
[PB82-138959]
Briefs of accidents involving alcohol as a cause/factor, U.S. general aviation, 1979 N82-27247
[PB82-138942]
Briefs of fatal accidents involving weather as a cause/factor, U.S. general aviation, 1979 N82-27248
[PB82-138934]
Briefs of accidents involving commuter air carriers and on-demand air taxi operations, U.S. general aviation, 1979 N82-27255
[PB82-138991]
Briefs of accidents involving aerial application operations, U.S. general aviation, 1979 N82-27256
[PB82-138983]
Briefs of accidents involving amateur/home built aircraft, U.S. general aviation, 1979 N82-27257
[PB82-138975]
CENTRIFUGAL COMPRESSORS
The performance of centrifugal compressor channel diffusers A82-35279
[ASME PAPER 82-GT-10]
Investigation of blade vibration of radial impellers by means of telemetry and holographic interferometry A82-35295
[ASME PAPER 82-GT-34]
Conversion of centrifugal compressor performance curves considering non-similar flow conditions A82-35300
[ASME PAPER 82-GT-42]
Casing treatments on a supersonic diffuser for high pressure ratio centrifugal compressors A82-35331
[ASME PAPER 82-GT-85]
Liquid particle dynamics and rate of evaporation in the rotating field of centrifugal compressors A82-35332
[ASME PAPER 82-GT-86]
The effect of inlet distortion on the performance characteristics of a centrifugal compressor A82-35335
[ASME PAPER 82-GT-92]
Design and investigations of a three dimensionally twisted diffuser for centrifugal compressors A82-35339
[ASME PAPER 82-GT-102]
On the performance prediction of a centrifugal compressor scaled up A82-35345
[ASME PAPER 82-GT-112]
Accuracy expectations for gas turbine and centrifugal compressor performance testing A82-35358
[ASME PAPER 82-GT-128]
Effect of impeller extended shrouds on centrifugal compressor performance as a function of specific speed A82-35411
[ASME PAPER 82-GT-228]
CERAMICS
Ceramic component development for limited-life propulsion engines A82-34979
[AIAA PAPER 82-1050]
Demonstration of ceramic hot-section static components in a radial flow turbine A82-35392
[ASME PAPER 82-GT-184]
Ceramic components for automotive and heavy duty turbine engines - CATE and AGT 100 A82-35432
[ASME PAPER 82-GT-253]
Ceramic turbine housings A82-35463
[ASME PAPER 82-GT-293]
CERTIFICATION
Certification of an airborne Loran-C navigation system A82-35876
Boeing's new transports in a flight-test marathon A82-37493
CH-47 HELICOPTER
Flight demonstration of an integrated floor/fuel isolation system A82-37708
[AHS PREPRINT 81-16]
Advanced internal cargo system concept demonstration and evaluation N82-26282
[AD-A111990]
CHANNEL FLOW
The performance of centrifugal compressor channel diffusers A82-35279
[ASME PAPER 82-GT-10]
CHECKOUT
Model test and full scale checkout of dry-cooled jet runup sound suppressors A82-35079
[AIAA PAPER 82-1239]

Flight demonstration of an integrated floor/fuel isolation system
[AHS PREPRINT 81-16] A82-37788
Flying qualities criteria for GA single pilot IFR operations
N82-26213
Flight-test verification of a pictorial display for general aviation instrument approach
[NASA-TM-83305] N82-26288
Mode S system accuracy
[AD-A112249] N82-27266
B-747 vortex alleviation flight tests: Ground-based sensor measurements
[AD-A113621] N82-27287
Digital image processing for acquisition, tracking, hand off and ranging
N82-27303

FLIR DETECTORS
Helicopter night vision system simulation evaluation
[AD-A110505] N82-26292

FLOATING POINT ARITHMETIC
A floating-point/multiple-precision processor for airborne applications
[NASA-TM-84252] N82-26289

FLOW CHARACTERISTICS
CFD technology for propulsion installation design - Forecast for the 80's --- computational fluid dynamics in aerospace applications
[ASME PAPER 82-GT-21] A82-35289
Conversion of centrifugal compressor performance curves considering non-similar flow conditions
[ASME PAPER 82-GT-42] A82-35300
Design and investigations of a three dimensionally twisted diffuser for centrifugal compressors
[ASME PAPER 82-GT-102] A82-35339
Current techniques for jet engine test cell modeling
[AIAA PAPER 82-1272] A82-37712

FLOW DISTORTION
The effect of inlet distortion on the performance characteristics of a centrifugal compressor
[ASME PAPER 82-GT-92] A82-35335
Prediction of cruise missile inlet peak instantaneous distortion patterns from steady state and turbulence data using a statistical technique
[AIAA PAPER 82-1085] A82-37685

FLOW DISTRIBUTION
Selected results of the F-15 propulsion interactions program
[AIAA PAPER 82-1041] A82-34976
In-flight acoustic results from an advanced-design propeller at Mach numbers to 0.8
[AIAA PAPER 82-1120] A82-35017
F-14 inlet development experience
[ASME PAPER 82-GT-5] A82-35278
Semi-empirical analysis of liquid fuel distribution downstream of a plain orifice injector under cross-stream air flow
[ASME PAPER 82-GT-16] A82-35285
Design and investigations of a three dimensionally twisted diffuser for centrifugal compressors
[ASME PAPER 82-GT-102] A82-35339
Influence of casing treatment on the operating range of axial compressors
[ASME PAPER 82-GT-103] A82-35340
A mixed-flow cascade passage design procedure based on a power series expansion
[ASME PAPER 82-GT-121] A82-35351
On the vortex flow over delta and double-delta wings
[AIAA PAPER 82-0949] A82-37466
Approximate boundary condition procedure for the two-dimensional numerical solution of vortex wakes
[AIAA PAPER 82-0951] A82-37467
A grid interfacing zonal algorithm for three-dimensional transonic flows about aircraft configurations
[AIAA PAPER 82-1017] A82-37477
Turbulence measurements in a confined jet using a six-orientation hot-wire probe technique
[AIAA PAPER 82-1262] A82-37710
Aerodynamically induced vibration
[AD-A110493] N82-26306
Comparison of numerical results and measured data for smooth and indented nosetips
[AD-A111794] N82-26619
Proceedings of the 12th Navy Symposium on Aeroballistics, volume 2
[AD-A111783] N82-27312

FLOW EQUATIONS
The numerical solution of the Navier-Stokes equations for incompressible turbulent flow over airfoils
[AD-A111279] N82-26612

FLOW GEOMETRY
A comprehensive method for preliminary design optimization of axial gas turbine stages
[AIAA PAPER 82-1264] A82-35091
The use of optimization techniques to design controlled diffusion compressor blading
[ASME PAPER 82-GT-149] A82-35373
The calculation of deviation angle in axial-flow compressor cascades
[ASME PAPER 82-GT-230] A82-35412

FLOW MEASUREMENT
Casing wall boundary-layer development through an isolated compressor rotor
[ASME PAPER 82-GT-18] A82-35287
Secondary flow mixing losses in a centrifugal impeller
[ASME PAPER 82-GT-44] A82-35302
Turbulence measurements in a confined jet using a six-orientation hot-wire probe technique
[AIAA PAPER 82-1262] A82-37710
Correcting for turbulence effects on average velocity measurements made using five hole spherical pitot tube probes
[AD-A112573] N82-27290

FLOW REGULATORS
Gas turbine airflow control for optimum heat recovery
[ASME PAPER 82-GT-83] A82-35329

FLOW STABILITY
Casing treatments on a supersonic diffuser for high pressure ratio centrifugal compressors
[ASME PAPER 82-GT-85] A82-35331

FLOW THEORY
Secondary flows and losses in axial flow turbines
[ASME PAPER 82-GT-19] A82-35288
Chordwise and compressibility corrections for arbitrary planform slender wings
A82-37931

FLOW VELOCITY
The influence of flow rate on the wake in a centrifugal impeller
[ASME PAPER 82-GT-45] A82-35303
Effect of impeller extended shrouds on centrifugal compressor performance as a function of specific speed
[ASME PAPER 82-GT-228] A82-35411
Wind tunnel measurements of three-dimensional wakes of buildings --- for aircraft safety applications
[NASA-CR-3565] N82-26921
Acoustic properties of turbofan inlets
[NASA-CR-169016] N82-27090

FLUID FLOW
Experiments on fuel heating for commercial aircraft
[NASA-TM-82878] N82-26483

FLUID PRESSURE
The effect of journal misalignment on the oil-film forces generated in a squeeze-film damper
[ASME PAPER 82-GT-285] A82-35457
Semi-active fluid inertia - A new concept in vibration isolation
[AHS PREPRINT 81-17] A82-37789

FLUIDICS
Reliability and maintainability analysis of fluidic back-up flight control system and components
[AD-A110496] N82-27320

FLUTTER
A simple system for helicopter Individual-Blade-Control and its application to stall flutter suppression
A82-37765
Comparison of analytical and wind-tunnel results for flutter and gust response of a transport wing with active controls
[NASA-TP-2010] N82-26703

FLUTTER ANALYSIS
Aerodynamic lag functions, divergence, and the British flutter method
A82-35820
F-16 active flutter suppression program
A82-37947

Investigation of an improved structural model for damaged T-38 horizontal stabilizer flutter analysis using NASTRAN
[AD-A111095] N82-26316

FLYING EJECTION SEATS
Current ADS restraint system status, trade-off constraints and long range objectives for the Maximum Performance Ejection System (MPES)
[AD-A112645] N82-27230

FORCED VIBRATION
The influence of Coriolis forces on gyroscopic motion of spinning blades
[ASME PAPER 82-GT-163] A82-35384

FOREIGN BODIES
Foreign object impact design criteria, volume 2
[AD-A112701] N82-27313
Foreign object impact design criteria, volume 3
[AD-A112447] N82-27314

FORMING TECHNIQUES
Net shape components for small gas turbine engines
[ASME PAPER 82-GT-96] A82-35338

FRAGMENTS
Rotor fragment protection program: Statistics on aircraft gas turbine ngine rotor failures that occurred in U.S. commercial aviation during 1978
[NASA-CR-165388] N82-27316

FREEZING
The low temperature properties of aviation fuels
[ASME PAPER 82-GT-48] A82-35306

FREQUENCY SHIFT KEYING
A single-frequency multitransmitter telemetry technique A82-36281

FROST DAMAGE
Aerodynamic investigations to determine possible ice flight paths
[NASA-TM-76648] N82-27235

FUEL COMBUSTION
NASA Broad Specification Fuels Combustion Technology program - Pratt and Whitney Aircraft Phase I results and status
[AIAA PAPER 82-1088] A82-34999
NASA/General Electric broad-specification fuels combustion technology program - Phase I results and status
[AIAA PAPER 82-1089] A82-35000
Carbon formation by the pyrolysis of gas turbine fuels in preflame regions of gas turbine combustors
[ASME PAPER 82-GT-84] A82-35330
Combustion behavior of solid fuel Ramjets. Volume 2: Effects of fuel properties and fuel-air mixing on combustion efficiency
[AD-A110796] N82-26303
Radiation/catalytic augmented combustion
[AD-A112376] N82-27434
An investigation of engine and test cell operating conditions on the effectiveness of smoke suppressant fuel additives
[AD-A112800] N82-27527

FUEL CONSUMPTION
Individual bypass throttling in fighter engines
[AIAA PAPER 82-1285] A82-35100
Progress in the development of energy efficient engine components
[ASME PAPER 82-GT-275] A82-35450
Investigation of air transportation technology at Princeton University, 1981 N82-26212
Input/output models for general aviation piston-prop aircraft fuel economy N82-26215
Effect on fuel efficiency of parameter variations in the cost function for multivariable control of a turbofan engine
[AD-A110614] N82-26301

FUEL CONTROL
Adaptive fuel control feasibility investigation for helicopter applications
[ASME PAPER 82-GT-205] A82-35400
Electronic control for small engines
[AIAA PAPER 82-1126] A82-37688

FUEL CORROSION
Commercial aircraft airframe fuel systems surveys
[AD-A112241] N82-27524

FUEL FLOW
Atomization quality of twin fluid atomizers for gas turbines
[ASME PAPER 82-GT-61] A82-35314

The Schladitz fuel injector: An initial performance evaluation without burning
[AD-A113612] N82-27315

FUEL INJECTION
Influence of airblast atomizer design features on mean drop size
[AIAA PAPER 82-1073] A82-34993
Evaluation of fuel injection configurations to control carbon and soot formation in small GT combustors
[AIAA PAPER 82-1175] A82-35041
Semi-empirical analysis of liquid fuel distribution downstream of a plain orifice injector under cross-stream air flow
[ASME PAPER 82-GT-16] A82-35285
Thermal decomposition of aviation fuel
[ASME PAPER 82-GT-27] A82-35292
Atomization quality of twin fluid atomisers for gas turbines
[ASME PAPER 82-GT-61] A82-35314
HC and CO emission abatement via selective fuel injection
[ASME PAPER 82-GT-178] A82-35390
Investigation of spray characteristics for flashing injection of fuels containing dissolved air and superheated fuels
[NASA-CR-3563] N82-26295
The Schladitz fuel injector: An initial performance evaluation without burning
[AD-A113612] N82-27315

FUEL OILS
Plain-jet airblast atomization of alternative liquid petroleum fuels under high ambient air pressure conditions
[ASME PAPER 82-GT-32] A82-35293

FUEL SPRAYS
A spark ignition model for liquid fuel sprays applied to gas turbine engines A82-37220

FUEL SYSTEMS
Flight demonstration of an integrated floor/fuel isolation system
[AHS PREPRINT 81-16] A82-37788
Commercial aircraft airframe fuel systems surveys
[AD-A112241] N82-27524

FUEL TESTS
Evaluation of fuel injection configurations to control carbon and soot formation in small GT combustors
[AIAA PAPER 82-1175] A82-35041
Aircraft fire safety research with antimisting fuels - Status report
[AIAA PAPER 82-1235] A82-35076
Thermal decomposition of aviation fuel
[ASME PAPER 82-GT-27] A82-35292
The low temperature properties of aviation fuels
[ASME PAPER 82-GT-48] A82-35306
Deposit formation in hydrocarbon fuels
[ASME PAPER 82-GT-49] A82-35307
Experimental study of external fuel vaporization
[ASME PAPER 82-GT-59] A82-35312
A procedure for evaluating fuel composition effects on combustor life
[ASME PAPER 82-GT-296] A82-35465
An alternate test procedure to qualify future fuels for Navy aircraft
[AIAA PAPER 82-1233] A82-36175
Evaluating the effectiveness of hydrorefining of the low-stability component of T-1 fuel A82-36673

FUEL-AIR RATIO
Numerical and experimental examination of a prevaporized/premixed combustor
[AIAA PAPER 82-1074] A82-34994
Plain-jet airblast atomization of alternative liquid petroleum fuels under high ambient air pressure conditions
[ASME PAPER 82-GT-32] A82-35293
Combustion behavior of solid fuel Ramjets. Volume 2: Effects of fuel properties and fuel-air mixing on combustion efficiency
[AD-A110796] N82-26303

FULL SCALE TESTS
Model test and full scale checkout of dry-cooled jet runup sound suppressors
[AIAA PAPER 82-1239] A82-35079

OPTIMIZATION
Optimization of propeller blade shape by an analytical method
[AIAA PAPER 82-1125] A82-35021
The use of optimization techniques to design controlled diffusion compressor blading
[ASME PAPER 82-GT-149] A82-35373
A cost modeling approach to engine optimization
[AIAA PAPER 82-1185] A82-37698
Static and aeroelastic optimization of aircraft
A82-37945
Use of optimization to predict the effect of selected parameters on commuter aircraft performance
[NASA-CR-169027] N82-26279
Minimum time turns constrained to the vertical plane
[AD-A111096] N82-26317
Panel Optimization with Integrated Software (POIS), Volume 2. User instructions: ECHO and RRSYS
[AD-A112224] N82-27411
ORBIT SPECTRUM UTILIZATION
Frequency sharing between passive sensors and aeronautical radionavigation systems employing ground transponders in the band 4.2 - 4.4 GHz
[NASA-CR-169041] N82-26261
ORIFICE FLOW
Semi-empirical analysis of liquid fuel distribution downstream of a plain orifice injector under cross-stream air flow
[ASME PAPER 82-GT-16] A82-35285
OXIDATION
Effect of some nitrogen compounds thermal stability of jet A
[NASA-TM-82908] N82-27519
OXIDATION RESISTANCE
The effect of NaCl/g/ in high temperature oxidation
[ASME PAPER 82-GT-106] A82-35342
OXYGEN BREATHING
An oxygen enriched air system for the AV-8A Harrier
[AD-A112334] N82-27239
OXYGEN SUPPLY EQUIPMENT
An oxygen enriched air system for the AV-8A Harrier
[AD-A112334] N82-27239

P

PANELS
Panel Optimization with Integrated Software (POIS), Volume 2. User instructions: ECHO and RRSYS
[AD-A112224] N82-27411
Hurricane-induced wind loads
[PB82-132267] N82-27548
PARTICLE MOTION
Liquid particle dynamics and rate of evaporation in the rotating field of centrifugal compressors
[ASME PAPER 82-GT-86] A82-35332
PARTICLE SIZE DISTRIBUTION
Field test of an in stack diffusion classifier on an aircraft engine test cell
[AD-A113811] N82-27326
PASCAL (PROGRAMMING LANGUAGE)
Formal specification and mechanical verification of SIFT - A fault-tolerant flight control system
A82-37446
PASSENGER AIRCRAFT
A gust damper --- for light passenger aircraft
A82-37127
Use of optimization to predict the effect of selected parameters on commuter aircraft performance
[NASA-CR-169027] N82-26279
Briefs of accidents involving computer air carriers and on-demand air taxi operations, U.S. general aviation, 1979
[PB82-138991] N82-27255
PATRIOT MISSILE
The PATRIOT Radar in tactical air defense
A82-37031
PATTERN REGISTRATION
Automatic handoff of multiple targets
[AD-A107490] N82-27561
PERFORMANCE PREDICTION
Development of a helicopter rotor/propulsion system dynamics analysis
[AIAA PAPER 82-1078] A82-34997
Small turbine engine augmentor design methodology
[AIAA PAPER 82-1179] A82-35044
On the influence of the number of stages on the efficiency of axial-flow turbines
[ASME PAPER 82-GT-43] A82-35301
On the performance prediction of a centrifugal compressor scaled up
[ASME PAPER 82-GT-112] A82-35345
A critical appraisal of some current incidence loss models for the stator and rotor of a mixed flow gas turbine
[ASME PAPER 82-GT-120] A82-35350
Development and application of a performance prediction method for straight rectangular diffuser
[ASME PAPER 82-GT-122] A82-35352
An inviscid-viscous interaction treatment to predict the blade-to-blade performance of axial compressors with leading edge normal shock waves
[ASME PAPER 82-GT-135] A82-35363
A stage-by-stage dual-spool compression system modeling technique
[ASME PAPER 82-GT-189] A82-35394
TURBOTRANS - A programming language for the performance simulation of arbitrary gas turbine engines with arbitrary control systems
[ASME PAPER 82-GT-200] A82-35396
Evaluation criteria for aero engine materials
A82-36065
General purpose research rotor
[AHS PREPRINT 81-9] A82-37777
Use of optimization to predict the effect of selected parameters on commuter aircraft performance
[NASA-CR-169027] N82-26279
User's manual for the vertical axis wing turbine code VDART2
[DE82-000796] N82-26828
PERFORMANCE TESTS
Influence of airblast atomizer design features on mean drop size
[AIAA PAPER 82-1073] A82-34993
Increased capabilities of the Langley Mach 7 Scramjet Test Facility
[AIAA PAPER 82-1240] A82-35080
The performance of centrifugal compressor channel diffusers
[ASME PAPER 82-GT-10] A82-35279
Conversion of centrifugal compressor performance curves considering non-similar flow conditions
[ASME PAPER 82-GT-42] A82-35300
Atomization quality of twin fluid atomizers for gas turbines
[ASME PAPER 82-GT-61] A82-35314
The use of performance-monitoring to prevent compressor and turbine blade failures
[ASME PAPER 82-GT-66] A82-35316
Cryogenic turbine testing
[ASME PAPER 82-GT-113] A82-35346
Performance analysis of the test results on a two-stage transonic fan
[ASME PAPER 82-GT-123] A82-35353
Accuracy expectations for gas turbine and centrifugal compressor performance testing
[ASME PAPER 82-GT-128] A82-35358
FAA tests on the Navstar GPS Z-set
A82-37039
Application and testing of metallic coatings on graphite/epoxy composites
A82-37074
Evaluation of sensitivity of ultrasonic detection of disbonds in graphite/epoxy to metal joints
A82-37080
Experimental performance evaluation of 'ventilated mixers' - A new mixer concept for high bypass turbofan engines
[AIAA PAPER 82-1136] A82-37695
Cold regions testing of an air transportable shelter
[AD-A107131] N82-27325
PHASED ARRAYS
Spiral slotted phased antenna array
[NASA-CASE-MSC-18532-1] N82-27558
PILOT ERROR
Proposed research tasks for the reduction of human error in naval aviation mishaps
[AD-A112339] N82-27241
Briefs of accidents involving alcohol as a cause/factor, U.S. general aviation, 1979
[PB82-138942] N82-27247

PILOT PERFORMANCE
Army helicopter crew seat vibration - Past performance, future requirements
[AHS PREPRINT 81-3] A82-37779
Cockpit display of traffic information and the measurement of pilot workload: An annotated bibliography
[AD-A113637] N82-27291
PILOTS
Notes on lateral-directional pilot induced oscillations
[AD-A113996] N82-27322
PISTON ENGINES
Input/output models for general aviation piston-prop aircraft fuel economy N82-26215
PITCH (INCLINATION)
Optimization of blade pitch angle for higher harmonic rotor control A82-37776
Flight experiments using the front-side control technique during piloted approach and landing in a powered lift STOL aircraft
[NASA-TM-81337] N82-26314
Yawing of wind turbines with blade cyclic-pitch variation
[DE81-029639] N82-26822
PITOT TUBES
Correcting for turbulence effects on average velocity measurements made using five hole spherical pitot tube probes
[AD-A112573] N82-27290
PLASTIC AIRCRAFT STRUCTURES
Ageing of composite rotor blades A82-37771
PLOTTERS
Loran-C plotting program for plotting lines of position on standard charts N82-26206
PLUMES
Field test of an in stack diffusion classifier on an aircraft engine test cell
[AD-A113011] N82-27326
POLAR WANDERING (GEOLOGY)
A comparison of pole positions derived from GPS satellite and Navy navigation satellite observations
[AD-A110765] N82-26268
POLICIES
Software technology transfer and export control
[AD-A106069] N82-28017
POLLUTION CONTROL
Smoke reduction in FJR-710 turbofan engines by an airblast combustor
[ASME PAPER 82-GT-28] A82-35290
Fuel microemulsions for jet engine smoke reduction
[ASME PAPER 82-GT-33] A82-35294
POLYCARBONATES
Mechanical property characterization and modeling of structural materials --- for airframes and aircraft gas turbine engines
[AD-A113081] N82-27704
POLYIMIDE RESINS
Kevlar/PMR-15 polyimide matrix composite for a complex shaped DC-9 drag reduction fairing
[AIAA PAPER 82-1067] A82-37678
Develop, demonstrate, and verify large area composite structural bonding with polyimide adhesives --- adhesively bonding graphite-polyimide structures
[NASA-CR-165839] N82-26465
POLYTETRAFLUOROETHYLENE
Performance of PTFE-lined composite journal bearings
[ASLE PREPRINT 82-AM-1A-1] A82-37850
POSITION (LOCATION)
A comparison of pole positions derived from GPS satellite and Navy navigation satellite observations
[AD-A110765] N82-26268
The effect of ionospheric variability on the accuracy of high frequency position location
[AD-A107425] N82-26274
Mode S system accuracy
[AD-A112209] N82-27266
POSITION ERRORS
Gravity induced position errors in airborne inertial navigation
[AD-A113823] N82-27272
POSITIONING
An unbiased analysis of the Doppler coordinate systems [illegible]
[AD-A110518]
POTENTIAL FLOW
Applied computational transonics - Capabilities and limitations A82-35366
Evaluation of full potential flow methods for the design and analysis of transport wings A82-35367
POWDER METALLURGY
Hot isostatically pressed manufacture of high strength MERL 76 disk and seal shapes
[NASA-CR-165549] N82-26439
POWER EFFICIENCY
On the influence of the number of stages on the efficiency of axial-flow turbines
[ASME PAPER 82-GT-43] A82-35301
Performance analysis of the test results on a two-stage transonic fan
[ASME PAPER 82-GT-123] A82-35353
Accuracy expectations for gas turbine and centrifugal compressor performance testing
[ASME PAPER 82-GT-128] A82-35356
Interim review of the Energy Efficient Engine /E3/ Program
[ASME PAPER 82-GT-271] A82-35467
POWERED LIFT AIRCRAFT
Flight experiments using the front-side control technique during piloted approach and landing in a powered lift STOL aircraft
[NASA-TM-81337] N82-26314
PREAMPLIFIERS
A balanced active antenna and impulse noise blanket system for the Raydist T radio navigation receiver
[AD-A114074] N82-27275
PREDICTION ANALYSIS TECHNIQUES
Turbine blade nonlinear structural and life analysis
[AIAA PAPER 82-1056] A82-34981
Blade loss transient dynamic analysis of turbomachinery
[AIAA PAPER 82-1057] A82-34982
Turbine stage heat flux measurements
[AIAA PAPER 82-1289] A82-35102
Current status of inlet flow prediction methods
[AD-A111784] N82-26311
PREMIXED FLAMES
Experimental study of the effects of secondary air on the emissions and stability of a lean premixed combustor
[AIAA PAPER 82-1072] A82-34992
Numerical and experimental examination of a prevaporized/premixed combustor
[AIAA PAPER 82-1074] A82-34994
Models for a turbulent premixed dump combustor
[AIAA PAPER 82-1261] A82-37709
PREPROCESSING
Digital image processing for acquisition, tracking, hand off and ranging N82-27303
PRESSURE DISTRIBUTION
Design and investigations of a three dimensionally twisted diffuser for centrifugal compressors
[ASME PAPER 82-GT-102] A82-35339
Joint Anglo-American experience of the analysis of helicopter rotor blade pressure distribution A82-37770
Aerodynamically induced vibration
[AD-A110493] N82-26306
PRESSURE EFFECTS
Influence of airblast atomizer design features on mean drop size
[AIAA PAPER 82-1073] A82-34993
PRESSURE GRADIENTS
Real time pressure signal system for a rotary engine
[NASA-CASE-LEW-13622-1] N82-26290
Comparison of experimental and analytical performance for contoured endwall stators
[NASA-TM-82877] N82-26299
PRESSURE OSCILLATIONS
Experimental investigations on the flow in the impeller of a centrifugal fan
[ASME PAPER 82-GT-37] A82-35298
PRESSURE RATIO
Casing treatments on a supersonic diffuser for high pressure ratio centrifugal compressors
[ASME PAPER 82-GT-85] A82-35331

Secondary flows and losses in axial flow turbines
[ASME PAPER 82-GT-19] A82-35288
Secondary flow effects and mixing of the wake behind a turbine stator
[ASME PAPER 82-GT-46] A82-35304
The effect of coolant flow on the efficiency of a transonic HP turbine profile suitable for a small engine
[ASME PAPER 82-GT-63] A82-35315
The use of performance-monitoring to prevent compressor and turbine blade failures
[ASME PAPER 82-GT-66] A82-35316
A two-dimensional boundary-layer program for turbine airfoil heat transfer calculation
[ASME PAPER 82-GT-93] A82-35336
Effect of crossflows on the discharge coefficient of film cooling holes
[ASME PAPER 82-GT-147] A82-35371
Dry friction damping mechanisms in engine blades
[ASME PAPER 82-GT-162] A82-35383
Measurements of heat transfer coefficients on gas turbine components. I - Description, analysis and experimental verification of a technique for use in hostile environments
[ASME PAPER 82-GT-174] A82-35387
The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine
[ASME PAPER 82-GT-222] A82-35409
Structural dynamics of shroudless, hollow, fan blades with composite in-lays
[ASME PAPER 82-GT-284] A82-35456
The effect of erosion wear on the vibration characteristics of axial-turbine blades
A82-35874
Aerodynamic performance of high turning core turbine vanes in a two-dimensional cascade
[AIAA PAPER 82-1288] A82-37716
Laser anemometer measurements in an annular cascade of core turbine vanes and comparison with theory
[NASA-TP-2018] N82-26234
Static internal performance characteristics of two thrust reverser concepts for axisymmetric nozzles
[NASA-TP-2025] N82-26235
Yawing of wind turbines with blade cyclic-pitch variation
[DE81-029639] N82-26822

TURBINE ENGINES
Turbine stage heat flux measurements
[AIAA PAPER 82-1289] A82-35102
Demonstration of ceramic hot-section static components in a radial flow turbine
[ASME PAPER 82-GT-184] A82-35392
Ceramic turbine housings
[ASME PAPER 82-GT-293] A82-35463
Evaluation of a multivariable control design on a variable cycle engine simulation
[AIAA PAPER 82-1077] A82-37682
Blade tip gap effects in turbomachines: A review
[AD-A111892] N82-26308
Turbine engine lubricant reclamation
[AD-A112098] N82-26312
Bird impact analysis package for turbine engine fan blades
[NASA-TM-82831] N82-26701
Briefs of accidents involving turbine powered aircraft, US general aviation, 1979

Foreign object impact design criteria, volume 3
[AD-A112447] N82-27314

TURBINE EXHAUST NOZZLES
Demonstration of ceramic hot-section static components in a radial flow turbine
[ASME PAPER 82-GT-184] A82-35392

TURBINES
User's manual for the vertical axis wing turbine code VDART2
[DE82-000796] N82-26828

TURBOCOMPRESSORS
Test facility and data handling system for the development of axial compressors
[ASME PAPER 82-GT-73] A82-35322
Comprehensive analysis of an axial compressor test with adjustable guide vanes
[ASME PAPER 82-GT-74] A82-35323
Optimization of compressor vane and bleed settings
[ASME PAPER 82-GT-81] A82-35327
Influence of casing treatment on the operating range of axial compressors
[ASME PAPER 82-GT-103] A82-35340
Effect of the rear stage casing treatment on the overall performance of a multistage axial-flow compressor
[ASME PAPER 82-GT-110] A82-35344
An inviscid-viscous interaction treatment to predict the blade-to-blade performance of axial compressors with leading edge normal shock waves
[ASME PAPER 82-GT-135] A82-35363
The use of optimization techniques to design controlled diffusion compressor blading
[ASME PAPER 82-GT-149] A82-35373
The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine
[ASME PAPER 82-GT-222] A82-35409
The calculation of deviation angle in axial-flow compressor cascades
[ASME PAPER 82-GT-230] A82-35412
Progress in the development of energy efficient engine components
[ASME PAPER 82-GT-275] A82-35450
Aerodynamically induced vibration
[AD-A110493] N82-26306
Core compressor exit stage study, volume 6
[NASA-CR-165554] N82-27310
Advanced stratified charge rotary aircraft engine design study
[NASA-CR-165398] N82-27743

TURBOFAN ENGINES
Selection of a starting system for a low cost single engine fighter aircraft
[AIAA PAPER 82-1043] A82-34977
Energy efficient engine /E3/ technology status
[AIAA PAPER 82-1052] A82-34980
Transport engine control design

[NASA-CR-166293] N82-26262

KARPIN, E. B.
The effect of erosion wear on the vibration characteristics of axial-turbine blades
A82-35874

KASAI, N.
The effect of inlet distortion on the performance characteristics of a centrifugal compressor
[ASME PAPER 82-GT-92] A82-35335

KASEMIR, H. W.
Triggered lightning
A82-35727
Airborne warning systems for natural and aircraft-initiated lightning
A82-35729

KATZ, U.
Modeling solid-fuel Ramjet combustion including radiation heat transfer to the fuel surface
[AD-A107441] N82-27436

KAUFFMAN, R. E.
Research and development on wear metal analysis
[AD-A112100] N82-26446
Evaluation of plasma source spectrometers for the Air Force Oil Analysis Program
[AD-A113809] N82-27512

KAUFMAN, A.
Turbine blade nonlinear structural and life analysis
[AIAA PAPER 82-1056] A82-34981

KAWAI, R. T.
Kevlar/PMR-15 polyimide matrix composite for a complex shaped DC-9 drag reduction fairing
[AIAA PAPER 82-1047] A82-37670

KEELEY, K. R.
Investigation of the transonic calibration characteristics of turbine static pressure probes
[ASME PAPER 82-GT-280] A82-35454

KELLER, U. F.
Selection of a starting system for a low cost single engine fighter aircraft
[AIAA PAPER 82-1043] A82-34977

KEMPF, J. H.
Air Force Academy aeronautics digest: Spring/summer 1981
[AD-A112421] N82-27216

KENWORTHY, M. J.
A procedure for evaluating fuel composition effects on combustor life
[ASME PAPER 82-GT-296] A82-35465

KERCHER, D. M.
A two-dimensional boundary-layer program for turbine airfoil heat transfer calculation
[ASME PAPER 82-GT-93] A82-35336

KEYSER, D. R.
Reliability and maintainability analysis of fluidic back-up flight control system and components
[AD-A110496] N82-27320

KILROY, K. L.
A unified approach to helicopter NASTRAN modeling
[AHS PREPRINT 81-22] A82-37793

KIM, S.
Scaling effects on leakage losses in labyrinth seals
[ASME PAPER 82-GT-157] A82-35380

KINDERVATER, C.
Quasi-static and dynamic crushing of energy absorbing materials and structural components with the aim of improving helicopter crashworthiness
A82-37769

KING, S. P.
Assessment of the dynamic response of a structure when modified by the addition of mass, stiffness or dynamic absorbers
[AHS PREPRINT 81-18] A82-37790

KIRKER, T. J.
Measurements of heat transfer coefficients on gas turbine components. II - Applications of the technique described in part I and comparisons with results from a conventional measuring technique and predictions
[ASME PAPER 82-GT-175] A82-35388

KISH, J.
Selecting the best reduction gear concept for prop-fan propulsion systems
[AIAA PAPER 82-1124] A82-35020

KITAHARA, E.
Smoke reduction in FJR-710 turbofan engines by an airblast combustor
[ASME PAPER 82-GT-24] A82-35290

KLUEG, E. P.
Aircraft fire safety research with antimisting fuels - Status report
[AIAA PAPER 82-1235] A82-35076

KNIAT, J.
Transport engine control design
[AIAA PAPER 82-1076] A82-34996

KNUTSON, W. K.
Development of accelerated fuel-engines qualification procedures methodology, volume 1
[AD-A113461] N82-27317
Development of accelerated fuel-engines qualification procedures methodology. Volume 1: Appendices
[AD-A113532] N82-27318

KONVALINKA, R. J.
The Sortie-Generation Model system. Volume 2: Sortie-Generation Model user's guide
[AD-A110898] N82-26223
The Sortie-Generation Model system. Volume 4: Sortie-Generation Model programmers manual
[AD-A110899] N82-26224

YOST, D. H.
Development of Army high-energy fuel diesel/turbine-powered surface equipment, phase 2
[AD-A111942] N82-26487
YOST, S. R.
Commutated automatic gain control system
N82-26209
YOUNG, C.
Joint Anglo-American experience of the analysis of helicopter rotor blade pressure distribution
A82-37770
YOUNG, P.
Life-cycle-cost analysis of the microwave landing system ground and airborne systems
[AD-A110909] N82-26266
YU, C. L.
Elevation plane analysis of on-aircraft antennas
[AD-A112373] N82-26554

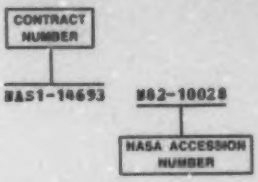
Z

ZAGRANSKI, R. D.
Adaptive fuel control feasibility investigation for helicopter applications
[ASME PAPER 82-GT-205] A82-35400
ZEID, I.
Engine dynamic analysis with general nonlinear finite element codes. II - Bearing element implementation, overall numerical characteristics and benchmarking
[ASME PAPER 82-GT-292] A82-35462
ZEISEL, K. S.
Assessment of lightning simulation test techniques, part 1
[AD-A112626] N82-27663
ZENOBI, T. J.
Development of a backpack survival kit for ejection seats
[AD-A113653] N82-27242
ZIMMER, F. O.
Development of accelerated fuel-engines qualification procedures methodology, volume 1
[AD-A113461] N82-27317
Development of accelerated fuel-engines qualification procedures methodology. Volume 1: Appendices
[AD-A113532] N82-27318
ZINN, B. T.
Acoustic properties of turbofan inlets
[NASA-CR-169016] N82-27090

CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 153)* OCTOBER 1982

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

VANELESS DIFFUSERS
The performance of centrifugal compressor channel diffusers
[ASME PAPER 82-GT-10] A82-35279
VANES
Improved vane-island diffusers at high swirl
[ASME PAPER 82-GT-68] A82-35318
Optimization of compressor vane and bleed settings
[ASME PAPER 82-GT-81] A82-35327
Aerodynamic performance of high turning core turbine vanes in a two-dimensional cascade
[AIAA PAPER 82-1288] A82-37716
VAPORIZERS
Experimental study of external fuel vaporization
[ASME PAPER 82-GT-59] A82-35312
VARIABLE CYCLE ENGINES
A concept for light-powered flight
[AIAA PAPER 82-1214] A82-35067
Individual bypass throttling in fighter engines
[AIAA PAPER 82-1285] A82-35100
Evaluation of a multivariable control design on a variable cycle engine simulation
[AIAA PAPER 82-1077] A82-37682
Reliability design study for a fault-tolerant electronic engine control
[AIAA PAPER 82-1129] A82-37689
VARIABLE GEOMETRY STRUCTURES
Comprehensive analysis of an axial compressor test with adjustable guide vanes
[ASME PAPER 82-GT-74] A82-35323
VARIABLE PITCH PROPELLERS
Optimization of blade pitch angle for higher harmonic rotor control
A82-37776
VELOCITY DISTRIBUTION
On the performance prediction of a centrifugal compressor scaled up
[ASME PAPER 82-GT-112] A82-35345
VELOCITY MEASUREMENT
Correcting for turbulence effects on average velocity measurements made using five hole spherical pitot tube probes
[AD-A112573] N82-27290
VENTILATION
Experimental performance evaluation of 'ventilated mixers' - A new mixer concept for high bypass turbofan engines
[AIAA PAPER 82-1136] A82-37695
VERTICAL ORIENTATION
Influence of meteorological processes on the verticality of electric fields
[AD-A111549] N82-26897
VERTICAL TAKEOFF AIRCRAFT
Lateral control system design for VTOL landing on a DD963 in high sea states
[NASA-CR-169074] N82-26315
Control optimization, stabilization and computer algorithms for aircraft applications
[NASA-CR-169015] N82-27009
VIBRATION
Aerodynamically induced vibration
[AD-A110493] N82-26306
VIBRATION DAMPING
Dry friction damping mechanisms in engine blades
[ASME PAPER 82-GT-162] A82-35383
Experimental evaluation of squeeze film supported flexible rotors
[ASME PAPER 82-GT-233] A82-35415
Solution to a bistable vibration problem using a plain, uncentralized squeeze film damper bearing
[ASME PAPER 82-GT-281] A82-35455
The effect of journal misalignment on the oil-film forces generated in a squeeze-film damper
[ASME PAPER 82-GT-285] A82-35457
A simple system for helicopter Individual-Blade-Control and its application to stall flutter suppression
A82-37765
The Helicopter Ride Revolution
[AHS PREPRINT 81-4] A82-37780
A simple system for helicopter individual-blade-control and its application to stall-induced vibration alleviation
[AHS PREPRINT 81-12] A82-37785
Substructure program for analysis of helicopter vibrations
[AHS PREPRINT 81-24] A82-37795
Use of optimization in helicopter vibration control by structural modification
[AHS PREPRINT 81-27] A82-37797
Survey of active and passive means to reduce rotorcraft vibrations
A82-37946
F-16 active flutter suppression program
A82-37947
VIBRATION EFFECTS
Army helicopter crew seat vibration - Past performance, future requirements
[AHS PREPRINT 81-3] A82-37779
VIBRATION ISOLATORS
Experimental evaluation of squeeze film supported flexible rotors
[ASME PAPER 82-GT-233] A82-35415
Solution to a bistable vibration problem using a plain, uncentralized squeeze film damper bearing
[ASME PAPER 82-GT-281] A82-35455
Design and evaluation of a state-feedback vibration controller
[AHS PREPRINT 81-10] A82-37783
Total main rotor isolation system
[AHS PREPRINT 81-15] A82-37787
Flight demonstration of an integrated floor/fuel isolation system
[AHS PREPRINT 81-16] A82-37788
Semi-active fluid inertia - A new concept in vibration isolation
[AHS PREPRINT 81-17] A82-37789
Assessment of the dynamic response of a structure when modified by the addition of mass, stiffness or dynamic absorbers
[AHS PREPRINT 81-18] A82-37790
Monofilar - A dual frequency rotorhead absorber
[AHS PREPRINT 81-20] A82-37791
Survey of active and passive means to reduce rotorcraft vibrations
A82-37946
VIBRATION MEASUREMENT
Investigation of blade vibration of radial impellers by means of telemetry and holographic interferometry
[ASME PAPER 82-GT-34] A82-35295
Experimental evaluation of squeeze film supported flexible rotors
[ASME PAPER 82-GT-233] A82-35415
VIBRATION MODE
The effect of erosion wear on the vibration characteristics of axial-turbine blades
A82-35874
Assessment of the dynamic response of a structure when modified by the addition of mass, stiffness or dynamic absorbers
[AHS PREPRINT 81-18] A82-37790
VIBRATION TESTS
Quantification of helicopter vibration ride qualities
A82-37767
Improved methods in ground vibration testing
[AHS PREPRINT 81-6] A82-37781
VIBRATORY LOADS
Transient vibration of high speed lightweight rotor due to sudden imbalance
[ASME PAPER 82-GT-231] A82-35413
Determination of in-flight helicopter loads and vibration
[AHS PREPRINT 81-7] A82-37782
VIDEO DATA
Marine Air Traffic Control and Landing System (METCALS) investigation
[AD-A113047] N82-27276
VIRGINIA
Final regulatory evaluation: Metropolitan Washington Airports Policy
[AD-A110583] N82-26324
VISCOUS FLOW
An inviscid-viscous interaction treatment to predict the blade-to-blade performance of axial compressors with leading edge normal shock waves
[ASME PAPER 82-GT-135] A82-35363
VISUAL CONTROL
Visual technology research simulator, visual and motion system dynamics
[AD-A111801] N82-26325
VISUAL FIELDS
Influence of contrast on spatial perception in TV display of moving images
[PB-50] N82-27609

VOCODERS
A comparative study of narrowband vocoder algorithms in Air Force operational environments using the Diagnostic Rhyme Test
[AD-A112053] N82-26546
VORTEX ALLEVIATION
B-747 vortex alleviation flight tests: Ground-based sensor measurements
[AD-A113621] N82-27287
VORTEX SHEDDING
Flows over wings with leading-edge vortex separation

ADVANCED STRATIFIED CHARGE ROTARY AIRCRAFT ENGINE DESIGN STUDY

P. Badgley, M. Berkowitz, C. Jones, D. Myers, E. Norwood, W. B. Pratt, D. R. Ellis (Cessna Aircraft Corp.), G. Huggins (Cessna Aircraft Corp.), A. Mueller (Cessna Aircraft Corp.), and J. H. Hembrey (Cessna Aircraft Corp.) 29 Jan. 1982 149 p refs
(Contract NAS3-21285)
(NASA-CR-165398; NAS 1.26:165398; CW-WR-81.021) Avail: NTIS HC A07/MF A01 CSCL 21A

A technology base of new developments which offered potential benefits to a general aviation engine was compiled and ranked. Using design approaches selected from the ranked list, conceptual design studies were performed of an advanced and a highly advanced engine sized to provide 186/250 shaft Kw/HP under cruise conditions at 7620/25,000 m/ft altitude. These are turbocharged, direct-injected stratified charge engines intended for commercial introduction in the early 1990's. The engine descriptive data includes tables, curves, and drawings depicting configuration, performance, weights and sizes, heat rejection, ignition and fuel injection system descriptions, maintenance requirements, and scaling data for varying power. An engine-airframe integration study of the resulting engines in advanced airframes was performed on a comparative basis with current production type engines. The results show airplane performance, costs, noise & installation factors. The rotary-engined airplanes display substantial improvements over the baseline, including 30 to 35% lower fuel usage. A.R.H.

MECHANICAL PROPERTY CHARACTERIZATION AND MODELING OF STRUCTURAL MATERIALS Final Report, Jun. 1979 - May 1981

Noel E. Ashbaugh, Henry L. Bernstein, Bhaskar Majumdar, and Jalees Ahmad Wright-Patterson AFB, Ohio AFWAL Feb. 1982 132 p refs
(Contract F33615-79-C-5025; AF Proj. 2307)
(AD-A113841; SRL-9799; AFWAL-TR-81-4187) Avail: NTIS HC A07/MF A01 CSCL 11/4

The crack growth behavior of engine disk nickel base superalloys operating in the temperature range 538-760 C was investigated. The effects of sustained load upon crack growth, crack growth in deleterious environments, and crack initiation and growth of short cracks were emphasized. Crack growth rate models were developed based upon experimental results and upon analytical characterization of fundamental processes which occur during crack growth. Mechanical property data were generated from tests including uniaxial tension, compression, bend, creep fatigue, low cycle fatigue, crack initiation, sustained load crack growth, and fatigue crack growth. The materials tested included nickel base superalloys, titanium, aluminum, and other structural materials. GRA

TRANSPORTATION NOISE, ITS IMPACT, PLANNING AND REGULATION

J. Manuel 1981 19 p refs Presented at the Intern. Symp. on Transportation Noise, Pretoria, 21-23 Oct. 1981
(S-258) Avail: NTIS HC A02/MF A01

Examples of the effects transportation noise has on communities are provided. Recent work in noise pollution in Canada is highlighted. National policies were examined and regulations were reviewed. T.M.

N82-27865# Airbus Industrie, Blagnac (France). Acoustics Dept. of Aerospatiale.

AIRBUS INDUSTRIE AND COMMUNITY NOISE

J. Chausonnet 1981 35 p Presented at the Intern. Symp. on Transportation Noise, Pretoria, 21-23 Oct. 1981
Avail: NTIS HC A03/MF A01

The contributions of the total noise perceived outside an aircraft during takeoff and landing by the engine and the aerodynamics of the aircraft are considered. The reduction of engine noise by design, the location of the engine and acoustic treatment of the nacelles is discussed. Aerodynamic noise reduction is considered in terms of aircraft design, operational procedures, and aircraft weight. A noise measuring facility used for checking operational procedures and measuring noise levels is described. Author

CONTROL OF AIR POLLUTION FROM AVIATION: THE EMISSION STANDARD SETTING PROCESS Ph.D. Thesis

Dennis Freeman Naugle 1981 260 p refs
(AD-A107435; AFIT-CI-81-26D) Avail: NTIS HC A12/MF A01 CSCL 01/2

The potential effects of aviation on ambient air quality with special emphasis on the requirement and techniques for setting aviation control standards are discussed. A logical framework called the 'hypothesis decision model' was developed. It offers a structured way of dealing with complex issues. Application of the model focuses on aircraft sources but a generic version is also proposed. Adoption would explicitly document the manner that technical evidence is considered in a variety of decisions concerning the establishment of emission standards. Author

The spherical harmonic expansion of the Earth's gravitational field has been obtained to degree 180 by combining several sources of data. The first data set was an a priori set of potential coefficients to degree 36 based on number of recent solutions including a substantial of resonance terms. A second data set was a 1 x 1 deg anomaly field derived from the SEASAT data set, while the third data set was an updated 1 x 1 deg terrestrial field. The last two fields were combined into one set containing 56761 1 x 1 deg values. The remaining values were computed from the a priori potential coefficients. A rigorous combination solution was not carried out. Instead all anomalies were weighted in such a way that the normal equations were diagonal. The results of the adjustment were 64800 1 x 1 deg anomalies that were expanded into spherical harmonics using the optimum quadrature procedure developed by Colombo. Accuracy estimates for each coefficient were obtained considering noise propagation and sampling error caused by the finite block size in which the anomalies are given. The percentage error of the solution reaches 100% near degree 120. The coefficients and their accuracy to degree 50 are listed in an appendix. GRA

TEST AND EVALUATION OF THE AIRPORT RADAR WIND SHEAR DETECTION SYSTEM Final Report, Mar. 1978 - May 1981

Dominick L. Offi, William Lewis, Tai Lee, and Alfred DeLaMarche Feb. 1982 39 p refs
(FAA Proj. 022-242-830)
(AD-A112663; DOT/FAA/CT-81/63; FAA-RD-81-85) Avail: NTIS HC A03/MF A01 CSCL 17/9

A wind shear detection system, developed to operate with airport surveillance radar ASH-(8), was installed and tested. Initial tests consisted of hardware and software shakedown and feasibility determinations. Second phase tests compared radar with aircraft and tower winds, evaluated the wind shear measurement capability under various weather conditions, and investigated the effectiveness of a simple two azimuth pointing strategy. Final efforts consisted of observations in all weather regimes and tests of a modified velocity azimuth display (VAD) and a glide slope scan. Results showed the system was compatible with and operate satisfactorily with the ASR-8. The processing and spectral display of clear air and precipitation returns is feasible. The accuracy of agreement, between radar measured winds and components of the aircraft measured winds in both radially oriented flights and runway offset flights using a two azimuth pointing technique, a glide slope scan, and a modified VAD was examined. ADVANCED TRAINING TECHNIQUES USING COMPUTER GENERATED IMAGERY Annual Technique Report, 16 May 1980 - 15 Jul. 1981
D. Hauck and D. Soblitz 15 Sep. 1981 74 p refs
(Contract F49620-79-C-0067; AF Proj. 2313)
(AD-A111979; MDC-M3026; AFOSR-82-0180TR) Avail: NTIS HC A04/MF A01 CSCL 05/9

Aircraft simulator systems have been primarily designed as substitutes for actual aircraft. The computer generated imagery of these systems provides the flexibility to enhance training in ways that cannot be done in the real world. The thrust of this research is to conceive and demonstrate training approaches to take advantage of this flexibility as a step towards reducing pilot combat attrition and increasing readiness. Two broad categories of techniques are available to us: (1) synthesizing tasks that are untrainable in aircraft during peacetime but are required during combat; and (2) application of teaching/learning methods unavailable in aircraft. Exploratory testing has begun on numerous techniques. A VITAL IV computer generated image (CGI) system has been used for testing and demonstration. Author (GRA)

COMPUTER IMAGE GENERATION: ADVANCED VISUAL/SENSOR SIMULATION Final Report
David Serreyn and David Duncan Brooks AFB, Texas AFHRL Oct. 1981 51 p refs
(Contract F33615-80-C-0006; AF Proj. 6114)
(AD-A107098; AFHRL-TP-81-23) Avail: NTIS HC A04/MF A01 CSCL 14/5

This study investigated, developed, and evaluated various Computer Image Generation (CIG) techniques to overcome the qualitative limitations of current CIG imaginery produced by edge-based systems. The study concluded with an integration of techniques into a system concept. This report describes the techniques investigated, the system concept developed, and the general hardware implementations which are useful for cost/benefit tradeoffs. The system concept presented is based on the use of textured terrain for realistic simulation. In areas where the technique was for training effectiveness and an algorithmically unified system. The approach also involves the display of terrain as curved surfaces represented by bicubic splines. Author (GRA)

AN ANALYSIS OF SELECTED ENHANCEMENTS TO THE EN ROUTE CENTRAL COMPUTING COMPLEX Final Report, May - Sep. 1981
William Broadley, Harvey Freeman, James Olesen, Ronald Rutledge, and Kenneth Thurber Washington Sep. 1981 105 p refs
(AD-A113575; DOT-TSC-FAA-81-20) Avail: NTIS HC A06/MF A01 CSCL 09/2

This report analyzes selected hardware enhancements that could improve the performance of the 9020 computer systems, which are used to provide en route air traffic control services. These enhancements could be implemented quickly, would be relatively inexpensive, and would provide a solution to the short-term but not the long-term problems that the system faces. Three memory enhancements are discussed. First, the storage element (SE) memory boxes could be replaced. Second, the memory stacks in the SE's could be replaced. Third, the memory stacks in the input-output control elements (IOCE's) could be replaced. Three processor enhancements are discussed. First, the processors in the compute elements (CE's) could be sped up. Second, the processors in the IOCE's could be sped up. Third, the CE's could be replaced. GRA

THE ANNOYANCE OF IMPULSIVE HELICOPTER NOISE Final Report, Jan. - Dec. 1981
K. Karamcheti Dec. 1981 27 p refs
(Grant NAG1-17)
(NASA-CR-169123; NAS 1.26:169123) Avail: NTIS HC A03/MF A01 CSCL 20A

A total of 96 impulsive and non-impulsive sounds were rated for annoyance by 10 subjects. The signals had the same amplitude spectrum with a maximum frequency of 4.75 kHz. By changing the phase of the spectral components different levels of impulsivity were obtained. The signals had coefficients of impulsivity of 10.8, 7.9, and -0.2 respectively. Further, signals had intensity levels 89 and 95 dBA, pulse repetition rates 10 and 20 Hz, and half the signals had pink noise added at a level 12 dBA lower than the level of the sound. The significant results were: The four females and six male subjects rated the impulsive sounds respectively 3.7 dB less annoying and 2.6 dB more annoying than the non-impulsive sounds. Overall, impulsivity had no effect. The hish pulse repetition rate increased annoyance by 2.2 dB. Addition of pink noise increased annoyance of the non-impulsive sounds 1.2 dB, but decreased the annoyence of the impulsive sounds 0.5 dB. T.M.

LEARNING AND COSTS IN AIRFRAME PRODUCTION, PART 1
Norman K. Womer and Thomas R. Gulledge, Jr. (Louisiana State Univ.) Oct. 1981 19 p refs Presented at the ORSA-TIMS Joint Natl. Meeting, Houston, Tex., 11-14 Oct. 1981
(Contracts N00014-75-C-0451; F33615-81-K5116; NR Proj. 365-049)
(AD-A112948; N131) Avail: NTIS HC A02/MF A01 CSCL 05/1

In recent years, there has been much interest in exploring the impact of learning and changes in production rate on program costs. Most researchers agree that learning is an important determinant of cost, but agreement on the cost impact of production rate changes has been less certain. Still, common sense and economic theory suggest that production rate should be an important determinant of cost. This importance is also suggested by the fact that cost penalties for production rate changes now occur in some department of defense contracts. This paper does not present a theoretical justification for the integration of learning curves with traditional neoclassical economic theory. The general theoretical framework for this paper is published in previous reserach. The purpose of this paper is to extend the range of applicability of the general framework by considering a previously unexplored specification. In particular, this paper explores the joint production situation, where learning and output are simultaneously produced, and a model is presented that has potential application in the airframe industry. The theoretical properties of the model are explored, and a cost minimizing solution is presented. Finally, a strategy is proposed for adapting the model to a particular airframe program. [ASME PAPER 82-GT-275] A82-35450
Engine dynamic analysis with general nonlinear finite element codes. II - Bearing element implementation, overall numerical characteristics and benchmarking
[ASME PAPER 82-GT-292] A82-35462
The effect of temperature ratios on the film cooling process
[ASME PAPER 82-GT-305] A82-35470
A spark ignition model for liquid fuel sprays applied to gas turbine engines
A82-37220
Development of counter-rotating intershaft support bearing technology for aircraft gas turbine engines
[AIAA PAPER 82-1054] A82-37679
Optical tip clearance sensor for aircraft engine controls
[AIAA PAPER 82-1131] A82-37691
Transient simulation of gas turbines including the effects of heat capacity of the solid parts
[ISBN-951-752-496-X] N82-26296
Life and Utilization Criteria Identification In Design (LUCID), volume 1
[AD-A111939] N82-26309

Life and Utilization Criteria Identification in Design (LUCID), volume 2
[AD-A111940] N82-26310
Depot support of gas turbine engines
[AD-A107101] N82-27217
Rotor fragment protection program: Statistics on aircraft gas turbine engine rotor failures that occurred in U.S. commercial aviation during 1978
[NASA-CR-165388] N82-27316
Mechanical property characterization and modeling of structural materials --- for airframes and aircraft gas turbine engines
[AD-A113841] N82-27704

GAS TURBINES
A comprehensive method for preliminary design optimization of axial gas turbine stages
[AIAA PAPER 82-1264] A82-35091
Atomization quality of twin fluid atomisers for gas turbines
[ASME PAPER 82-GT-61] A82-35314
The use of performance-monitoring to prevent compressor and turbine blade failures
[ASME PAPER 82-GT-66] A82-35316
Gas turbine airflow control for optimum heat recovery
[ASME PAPER 82-GT-83] A82-35329
Development of hybrid gas turbine bucket technology
[ASME PAPER 82-GT-94] A82-35337
A critical appraisal of some current incidence loss models for the stator and rotor of a mixed flow gas turbine
[ASME PAPER 82-GT-120] A82-35350
Accuracy expectations for gas turbine and centrifugal compressor performance testing
[ASME PAPER 82-GT-128] A82-35358
Performance of multiple, angled nozzles with short mixing stack eductor systems
[AD-A110817] N82-26302
Heat transfer in turbines
[AD-A111504] N82-26307

GAS-SOLID INTERACTIONS
Transient simulation of gas turbines including the effects of heat capacity of the solid parts
[ISBN-951-752-496-X] N82-26296

GEARS
Selecting the best reduction gear concept for prop-fan propulsion systems
[AIAA PAPER 82-1124] A82-35020
Next generation turboprop gearboxes
[ASME PAPER 82-GT-236] A82-35418

GENERAL AVIATION AIRCRAFT
NASA research in aircraft propulsion
[ASME PAPER 82-GT-177] A82-35389
A single-frequency multitransmitter telemetry technique A82-36201
Investigation of air transportation technology at Princeton University, 1981 N82-26212
Flying qualities criteria for GA single pilot IFR operations N82-26213
Input/output models for general aviation piston-prop aircraft fuel economy N82-26215
Effects of wing-leading-edge modifications on a full-scale, low-wing general aviation airplane: Wind-tunnel investigation of high-angle-of-attack aerodynamic characteristics --- conducted in Langley 30- by 60-foot tunnel
[NASA-TP-2011] N82-26217
Flight-test verification of a pictorial display for general aviation instrument approach
[NASA-TM-83305] N82-26288
Propulsion opportunities for future commuter aircraft
[NASA-TM-82919] N82-26298
Briefs of accidents, involving corporate/executive aircraft, U.S. general aviation, 1979
[PB82-138967] N82-27245
Briefs of accidents involving missing and missing later recovered aircraft, U.S. general aviation, 1979
[PB82-138959] N82-27246
Briefs of accidents involving rotorcraft, U.S. general aviation, 1979
[PB82-138926] N82-27249
Briefs of accidents involving turbine powered aircraft, US general aviation, 1979
[PB82-138918] N82-27250
Briefs of accidents involving midair collisions: U.S. general aviation, 1979
[PB82-138900] N82-27251
Annual review of aircraft accident data: U.S. air carrier operations, 1979
[PB82-134339] N82-27253
Briefs of fatal accidents involving fixed-wing multi-engine aircraft, U.S. General aviation, 1979
[PB82-139007] N82-27254
Briefs of accidents involving amateur/home built aircraft, U.S. general aviation, 1979
[PB82-138975] N82-27257
A Loran-C prototype navigation receiver for general aviation
[NASA-CR-169118] N82-27259
Advanced microstrip antenna developments. Volume 2: Microstrip GPS antennas for general aviation aircraft
[AD-A113620] N82-27588

GEODETIC COORDINATES
An unbiased analysis of the Doppler coordinate systems
[AD-A110510] N82-26268

GEODETIC SATELLITES
Doppler test results of experimental GPS receiver
[AD-A113507] N82-27274

GEOMAGNETISM
A comparison of pole positions derived from GPS satellite and Navy navigation satellite observations
[AD-A110765] N82-26266
The Earth's gravity field to degree and order 180 using SEASAT altimeter data, terrestrial gravity data and other data
[AD-A113098] N82-27900

GEOMETRICAL OPTICS
Wide angle raster head up display design and application to future single seat fighters N82-27304

GLASS FIBER REINFORCED PLASTICS
Use of CGHRP in transport --- Carbon and Glass Hybrid Reinforced Plastics A82-37061
A significant role for composites in energy-efficient aircraft A82-37065
R & D on composite rotor blades at Agusta A82-37764
CFC drive shaft and GFC coupling for the tail rotor of the BO 105 A82-37766
Ageing of composite rotor blades A82-37771

GLIDE PATHS
Flight experiments using the front-side control technique during piloted approach and landing in a powered lift STOL aircraft
[NASA-TM-81337] N82-26319

GLIDERS
Briefs of accidents involving gliders, U.S. general aviation, 1979
[PB82-139015] N82-27256

GLOBAL POSITIONING SYSTEM
FAA tests on the Navstar GPS Z-set A82-37839
Navstar - Global Positioning System: A revolutionary capability A82-37890
Study of the global positioning system for maritime concepts/applications: Study of the feasibility of replacing maritime shipborne navigation systems with NAVSTAR
[NASA-CR-169031] N82-26263
Global Positioning System (GPS) geodetic receivers
[AD-A111026] N82-26267
A comparison of pole positions derived from GPS satellite and Navy navigation satellite observations
[AD-A110765] N82-26266
Data processing at the Global Positioning System master control station
[AD-A110553] N82-26270
Doppler test results of experimental GPS receiver
[AD-A113507] N82-27274

Performance analysis of the test results on a two-stage transonic fan
[ASME PAPER 82-GT-123] A82-35353
PRESSURE RECOVERY
An experimental investigation of S-duct diffusers for high-speed propfans
[AIAA PAPER 82-1123] A82-35019
The performance of centrifugal compressor channel diffusers
[ASME PAPER 82-GT-10] A82-35279
Improved vane-island diffusers at high swirl
[ASME PAPER 82-GT-68] A82-35318
Development and application of a performance prediction method for straight rectangular diffuser
[ASME PAPER 82-GT-122] A82-35352
PRESSURE REDUCTION
Optimization of compressor vane and bleed settings
[ASME PAPER 82-GT-81] A82-35327
A research program to reduce interior noise in general aviation airplanes. Influence of depressurization and damping material on the noise reduction characteristics of flat and curved stiffened panels
[NASA-CR-169035] N82-27088
PRESSURE SENSORS
Investigation of the transonic calibration characteristics of turbine static pressure probes
[ASME PAPER 82-GT-280] A82-35454
Real time pressure signal system for a rotary engine
[NASA-CASE-LEW-13622-1] N82-26294
PRESTRESSING
Experimental evaluation of squeeze film supported flexible rotors
[ASME PAPER 82-GT-233] A82-35415
PREVAPORIZATION
Numerical and experimental examination of a prevaporized/premixed combustor
[AIAA PAPER 82-1074] A82-34994
PRINTERS (DATA PROCESSING)
High-speed rotary printing device for air traffic control applications: A preliminary evaluation
[AD-A107325] N82-27264
PROBABILITY DISTRIBUTION FUNCTIONS
A result in the theory of spiral search
[AD-A112481] N82-27262
PROBLEM SOLVING
The numerical solution of the Navier-Stokes equations for incompressible turbulent flow over airfoils
[AD-A111279] N82-26612
PRODUCT DEVELOPMENT
Preplanned product improvement and other modification strategies: Lessons from past aircraft modification programs
[AD-A113599] N82-27220
PRODUCTION ENGINEERING
Specification and estimation of dynamic cost functions for airframe production airframes
[AD-A113147] N82-27221
PRODUCTION PLANNING
Mission effectiveness of the AV-8B Harrier 2 could be improved if actions are taken now
[AD-A111878] N82-26284
PROGRAM VERIFICATION (COMPUTERS)
Formal specification and mechanical verification of SIFT - A fault-tolerant flight control system
A82-37446
PROGRAMMING LANGUAGES
TURBOTRANS - A programming language for the performance simulation of arbitrary gas turbine engines with arbitrary control systems
[ASME PAPER 82-GT-200] A82-35396
PROP-FAN TECHNOLOGY
Propellers come full circle --- prop-fan technology for aircraft fuel savings
A82-35881
PROPANE
Deposit formation in hydrocarbon fuels
[ASME PAPER 82-GT-49] A82-35307
PROPELLANT DECOMPOSITION
Deposit formation in hydrocarbon fuels
[ASME PAPER 82-GT-49] A82-35307
PROPELLANT PROPERTIES
NASA/General Electric broad-specification fuels combustion technology program - Phase I results and status
[AIAA PAPER 82-1089] A82-35000
PROPELLER BLADES
Optimization of propeller blade shape by an analytical method
[AIAA PAPER 82-1125] A82-35021
PROPELLER EFFICIENCY
Propellers come full circle --- prop-fan technology for aircraft fuel savings
A82-35881
PROPELLER FANS
In-flight acoustic results from an advanced-design propeller at Mach numbers to 0.8
[AIAA PAPER 82-1120] A82-35017
An experimental investigation of S-duct diffusers for high-speed propfans
[AIAA PAPER 82-1123] A82-35019
Selecting the best reduction gear concept for prop-fan propulsion systems
[AIAA PAPER 82-1124] A82-35020
PROPELLERS
Summary and recent results from the NASA advanced High Speed Propeller Research Program
[NASA-TM-82891] N82-26219
Propulsion opportunities for future commuter aircraft
[NASA-TM-82915] N82-26298
On the design and test of a low noise propeller
[NASA-CR-165938] N82-27089
PROPULSION SYSTEM CONFIGURATIONS
NASA research in aircraft propulsion
[ASME PAPER 82-GT-177] A82-35389
PROPULSION SYSTEM PERFORMANCE
Charting propulsion's future - The ATES results --- Advanced technology Engine Studies program for aircraft engine design
[AIAA PAPER 82-1139] A82-35023
Design concepts of an advanced propulsion monitoring system
[AIAA PAPER 82-1130] A82-37690
Summary and recent results from the NASA advanced High Speed Propeller Research Program
[NASA-TM-82891] N82-26219
Propulsion opportunities for future commuter aircraft
[NASA-TM-82915] N82-26298
PROPULSIVE EFFICIENCY
Optimization of propeller blade shape by an analytical method
[AIAA PAPER 82-1125] A82-35021
PROTECTION
Protection of advanced electrical power systems from atmospheric electromagnetic hazards
[AD-A112612] N82-27658
PROTECTIVE COATINGS
Engine experience of turbine rotor blade materials and coatings
[ASME PAPER 82-GT-244] A82-35425
Application and testing of metallic coatings on graphite/epoxy composites
A82-37074
Protection of advanced electrical power systems from atmospheric electromagnetic hazards
[AD-A112612] N82-27658
PROTOTYPES
Status report of the USAF's Engine Model Derivative Program
[ASME PAPER 82-GT-183] A82-35391
A Loran-C prototype navigation receiver for general aviation
[NASA-CR-169118] N82-27259
PSYCHOACOUSTICS
The annoyance of impulsive helicopter noise
[NASA-CR-169123] N82-28138
PULSE DOPPLER RADAR
Medium PRF performance analysis --- Pulse-Repetition Frequency
A82-37378
PULSE RATE
Medium PRF performance analysis --- Pulse-Repetition Frequency
A82-37378
PULSED LASERS
A concept for light-powered flight
[AIAA PAPER 82-1214] A82-35067
Analysis of rotating structures using image derotation with multiple pulsed lasers and moire techniques
A82-36999

PULSEJET ENGINES
A concept for light-powered flight
[AIAA PAPER 82-1214] A82-35067
PYROLYSIS
Carbon formation by the pyrolysis of gas turbine fuels in preflame regions of gas turbine combustors
[ASME PAPER 82-GT-88] A82-35330

R

RADAR
Marine Air Traffic Control and Landing System (MATCALS) investigation
[AD-A113047] N82-27276
RADAR ANTENNAS
Adaptive multifunction sensor concept for air-ground missions
N82-27299
RADAR APPROACH CONTROL
Real-time simulation of an airborne radar for overwater approaches
[NASA-CR-166293] N82-26262
Terminal air traffic control with surveillance data from the mode S system: Results of system demonstrations to field controllers
[AD-A112632] N82-27268
RADAR BEACONS
Surveillance simulation testing of terminal and en route mode S sensors
[AD-A112250] N82-27265
RADAR DETECTION
Test and evaluation of the airport radar wind shear detection system
[AD-A112663] N82-27924
RADAR EQUIPMENT
An accurate Doppler navigator with microwave simplicity
A82-37037
Terminal air traffic control with surveillance data from the mode S system: Results of system demonstrations to field controllers
[AD-A112632] N82-27268
RADAR SCANNING
Comparison between the surveillance performances of the Air Traffic Control Radar Beacon System mode of the Mode S and the Automated Radar Terminal System
[AD-A111733] N82-26273
Design and implementation of efficient algorithms for automatic determination of corrected slant range
[AD-A112248] N82-27267
RADAR TRACKING
The PATRIOT Radar in tactical air defense
A82-37031
C band spectral tracking for FM/CW altimetry
A82-37035
RADIAL FLOW
A critical appraisal of some current incidence loss models for the stator and rotor of a mixed flow gas turbine
[ASME PAPER 82-GT-120] A82-35350
RADIATION CHEMISTRY
Radiation/catalytic augmented combustion
[AD-A112376] N82-27434
RADIATIVE HEAT TRANSFER
Modeling solid-fuel Ramjet combustion including radiation heat transfer to the fuel surface
[AD-A107441] N82-27436
RADIO ALTIMETERS
C band spectral tracking for FM/CW altimetry
A82-37035
Frequency sharing between passive sensors and aeronautical radionavigation systems employing ground transponders in the band 4.2 - 4.4 GHz
[NASA-CR-169041] N82-26261
RADIO BEACONS
Modification of OE-258/URN Tactical Air Navigation (TACAN) antenna group
[AD-A111680] N82-26264
Effects of high voltage transmission lines on non-directional beacon performance
[AD-A112311] N82-27281
RADIO COMMUNICATION
The Worldwide Navigational Warning Service
[AD-A107372] N82-26276
RADIO CONTROL
Standard engineering installation package. Air traffic radio channel control equipment: Change 1
[AD-A107150] N82-26275
RADIO EQUIPMENT
Standard engineering installation package. Air traffic radio channel control equipment: Change 1
[AD-A107150] N82-26275
RADIO FREQUENCY INTERFERENCE
Static charging and its effects on avionic systems
A82-35732
RADIO NAVIGATION
Commutated automatic gain control system
N82-26209
A prototype interface unit for microprocessor-based Loran-C receiver
N82-26210
Investigation of air transportation technology at Princeton University, 1981
N82-26212
Frequency sharing between passive sensors and aeronautical radionavigation systems employing ground transponders in the band 4.2 - 4.4 GHz
[NASA-CR-169041] N82-26261
Global Positioning System (GPS) geodetic receivers
[AD-A111026] N82-26267
A balanced active antenna and impulse noise blanket system for the Raydist T radio navigation receiver
[AD-A114074] N82-27275
RADIO RECEIVERS
FAA tests on the Raytheon GPS X-set
A82-37039
A Loran-C prototype navigation receiver for general aviation
N82-26208
Commutated automatic gain control system
N82-26209
A prototype interface unit for microprocessor-based Loran-C receiver
N82-26210
A Loran-C prototype navigation receiver for general aviation
[NASA-CR-169110] N82-27280
Doppler test results of experimental GPS receiver
[AD-A113587] N82-27279
A balanced active antenna and impulse noise blanket system for the Raydist T radio navigation receiver
[AD-A114074] N82-27275
RADIO TELEMETRY
A single-frequency multitransmitter telemetry technique
A82-36181
RAMJET ENGINES
Characteristics of a side dump gas generator ramjet
[AIAA PAPER 82-1256] A82-35083
Combustion behavior of solid fuel Ramjets. Volume 2: Effects of fuel properties and fuel-air mixing on combustion efficiency
[AD-A110796] N82-26162
Modeling solid-fuel Ramjet combustion including radiation heat transfer to the fuel surface
[AD-A107441] N82-27436
RANDOM VIBRATION
Improved methods in ground vibration testing
[AHS PREPRINT 81-6] A82-37781
RANGE (EXTREMES)
Wide field of view laser beacon system for three dimensional aircraft range measurements
N82-26316
REAL TIME OPERATION
Advancements in real-time engine simulation technology --- of digital electronic aircraft engine controls
[AIAA PAPER 82-1075] A82-38998
Real time pressure signal system for a rotary engine
[NASA-CASE-LEW-13622-1] N82-26288
Advanced target acquisition and tracking concepts for real time applications
N82-27306
Tactical systems approach to interdiction of 2nd echelon moving targets using real time sensors
N82-27306
RECLAMATION
Turbine engine lubricant reclamation
[AD-A112098] N82-26318

WIND TUNNEL TESTS
Selected results of the F-15 propulsion interactions program
[AIAA PAPER 82-1041] A82-34976
In-flight acoustic results from an advanced-design propeller at Mach numbers to 0.8
[AIAA PAPER 82-1120] A82-35017
Interior noise considerations for advanced high-speed turboprop aircraft
[AIAA PAPER 82-1121] A82-35018
An experimental investigation of S-duct diffusers for high-speed propfans
[AIAA PAPER 82-1123] A82-35019
F-14 inlet development experience
[ASME PAPER 82-GT-5] A82-35278
Experimental testing at transonic speeds --- wind tunnels
A82-35557
Investigation of subsonic nacelle performance improvement concept
[AIAA PAPER 82-1042] A82-37676
Transonic wind tunnel test of a supersonic nozzle installation
[AIAA PAPER 82-1045] A82-37677
Advanced exhaust nozzle concepts using spanwise blowing for aerodynamic lift enhancement
[AIAA PAPER 82-1132] A82-37692
Advanced nozzle integration for air combat fighter application
[AIAA PAPER 82-1135] A82-37694
F-16 active flutter suppression program
A82-37947
Effects of wing-leading-edge modifications on a full-scale, low-wing general aviation airplane: Wind-tunnel investigation of high-angle-of-attack aerodynamic characteristics --- conducted in Langley 30- by 60-foot tunnel
[NASA-TP-2011] N82-26217

WIND TURBINES
Yawing of wind turbines with blade cyclic-pitch variation
[DE81-029639] N82-26822

WINDPOWERED GENERATORS
User's manual for the vertical axis wind turbine code VDART2
[DE82-000796] N82-26828

WING LOADING
Comparison of analytical and wind-tunnel results for flutter and gust response of a transport wing with active controls
[NASA-TP-2010] N82-26703

WING PLANFORMS
Transonic computational experience for advanced tactical aircraft
A82-35563
Chordwise and compressibility corrections for arbitrary planform slender wings
A82-37931

WING PROFILES
Annular wing
[NASA-CASE-FRC-11007-2] N82-26277

WINGS
Application of computational methods to transonic wing-design
A82-35561
A-7 transonic wing designs
A82-35562
Evaluation of full potential flow methods for the design and analysis of transport wings
A82-35567

WORKLOADS (PSYCHOPHYSIOLOGY)
Update of the summary report of 1977-1978 task force on aircrew workload
[AD-A112547] N82-26258
Real-time simulation of an airborne radar for overwater approaches
[NASA-CR-166293] N82-26262
Cockpit display of traffic information and the measurement of pilot workload: An annotated bibliography
[AD-A113637] N82-27291

X

X WING ROTORS
Development of low-order model of an X-wing aircraft by system identification
[AD-A113760] N82-27286

Y

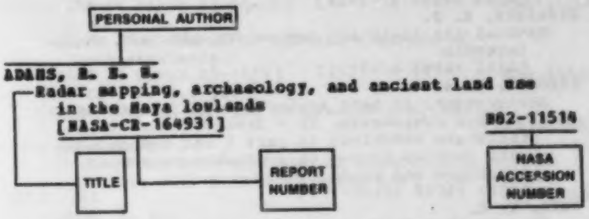
YAK 40 AIRCRAFT
The powerplants of the Yak-40 and M-15 aircraft --- Russian book
A82-36947

YAWING MOMENTS
Yawing of wind turbines with blade cyclic-pitch variation
[DE81-029639] N82-26822

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 153)* **OCTOBER 1982**

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

A

ABEL, I.
Comparison of analytical and wind-tunnel results for flutter and gust response of a transport wing with active controls
[NASA-TP-2010] N82-26703

ABELL, J. B.
The Sortie-Generation Model system. Volume 1: Executive summary
[AD-A110897] N82-26222
The Sortie-Generation Model system. Volume 2: Sortie-Generation Model user's guide
[AD-A110898] N82-26223
The Sortie-Generation Model system. Volume 4: Sortie-Generation Model programmers manual
[AD-A110899] N82-26224
The Sortie-Generation Model system. Volume 6: Spares subsystem
[AD-A110900] N82-26226

ACQUAVIVA, S. J.
Mechanical wear assessment of helicopter engines by ferrography
[AD-A110772] N82-26305

ADAMS, A.
Charting propulsion's future - The ATES results
[AIAA PAPER 82-1139] A82-35023

ADAMS, J. J.
Flight-test verification of a pictorial display for general aviation instrument approach
[NASA-TM-83305] N82-26288

ADAMS, M.
Engine dynamic analysis with general nonlinear finite element codes. II - Bearing element implementation, overall numerical characteristics and benchmarking
[ASME PAPER 82-GT-292] A82-35462

AHMAD, J.
Mechanical property characterization and modeling of structural materials
[AD-A113841] N82-27784

AIBA, T.
Transient vibration of high speed lightweight rotor due to sudden imbalance
[ASME PAPER 82-GT-231] A82-35413

AIELLO, R. A.
Structural dynamics of shroudless, hollow, fan blades with composite in-lays
[ASME PAPER 82-GT-284] A82-35456

AKHMEDOV, KH. A.
Evaluating the effectiveness of hydrorefining of the low-stability component of T-1 fuel
A82-36673

AL-MODAFAR, M. M.
Development and application of a performance prediction method for straight rectangular diffuser
[ASME PAPER 82-GT-122] A82-35352

ALEXANDER, D.
F-14 inlet development experience
[ASME PAPER 82-GT-5] A82-35278

ALEXANDER, J. V.
Advanced concepts for composite structure joints and attachment fittings. Volume 2: Design guide
[AD-A111106] N82-26280

ALIEV, A. A.
Evaluating the effectiveness of hydrorefining of the low-stability component of T-1 fuel
A82-36673

ALMROTH, B. O.
Panel Optimization with Integrated Software (POIS), Volume 2. User instructions: ECHO and BBSYS
[AD-A112224] N82-27411

ALSPAUGH, D. W.
Quasilinearization solution of the proportional navigation problem
[AD-A113668] N82-27273

ALT, R. E.
Performance of the AEDC Mark 1 Aerospace Environmental Chamber without oil diffusion pumping
[AD-A111406] N82-26322

ALTHER, G. A.
A significant role for composites in energy-efficient aircraft
A82-37065

ALVAREZ, R. A.
Development of accelerated fuel-engines qualification procedures methodology, volume 1
[AD-A113461] N82-27317
Development of accelerated fuel-engines qualification procedures methodology. Volume 1: Appendices

AERONAUTICAL ENGINEERING

A CONTINUING BIBLIOGRAPHY
WITH INDEXES

(Supplement 154)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in October 1982 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

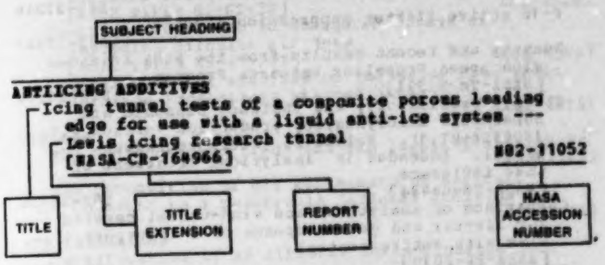
Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

SUBJECT INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 153)*

OCTOBER 1982

Typical Subject Index Listing



SUBJECT HEADING
ANTIICING ADDITIVES
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164966]
N82-11052
TITLE
TITLE EXTENSION
REPORT NUMBER
NASA ACCESSION NUMBER

The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by hyphens. The NASA or AIAA accession number is included in each entry to assist the user in locating the abstract in the abstract section of this supplement. If applicable, a report number is also included as an aid in identifying the document.

A

A-7 AIRCRAFT
A-7 transonic wing designs A82-35562

ABSORBERS (MATERIALS)
Quasi-static and dynamic crushing of energy absorbing materials and structural components with the aim of improving helicopter crashworthiness A82-37769

ACCIDENT PREVENTION
Flying qualities criteria for GA single pilot IFR operations N82-26213

Proposed research tasks for the reduction of human error in naval aviation mishaps
[AD-A112339] N82-27241

ACEE PROGRAM
Benefit cost analysis of the aircraft energy efficiency program
[NASA-CR-169116] N82-27280

ACOUSTIC EMISSION
Acoustic emission in jet engine fan blades A82-35257

ACOUSTIC EXCITATION
Development and validation of preliminary analytical models for aircraft interior noise prediction A82-38077

ACOUSTIC PROPERTIES
In-flight acoustic results from an advanced-design propeller at Mach numbers to 0.8
[AIAA PAPER 82-1120] A82-35017
Acoustic properties of turbofan inlets
[NASA-CR-169016] N82-27090

ACOUSTICS
Bibliography of Lewis Research Center technical publications announced in 1981
[NASA-TM-82838] N82-27191

ACTIVE CONTROL
A simple system for helicopter Individual-Blade-Control and its application to stall flutter suppression A82-37765

Design and evaluation of a state-feedback vibration controller
[AHS PREPRINT 81-10] A82-37783
Semi-active fluid inertia - A new concept in vibration isolation
[AHS PREPRINT 81-17] A82-37789

Comparison of analytical and wind-tunnel results for flutter and gust response of a transport wing with active controls
[NASA-TP-2010] N82-26703

ADAPTIVE CONTROL
Considerations of open-loop, closed-loop, and adaptive multicyclic control systems
[AHS PREPRINT 81-13] A82-37786
Effect on fuel efficiency of parameter variations in the cost function for multivariable control of a turbofan engine
[AD-A110614] N82-26301

ADDITIVES
An investigation of engine and test cell operating conditions on the effectiveness of smoke suppressant fuel additives
[AD-A112800] N82-27527

ADHESIVE BONDING
Develop, demonstrate, and verify large area composite structural bonding with polyimide adhesives --- adhesively bonding graphite-polyimide structures
[NASA-CR-165839] N82-26465

AERIAL RECONNAISSANCE
Some potential novel approaches to the automatic airborne detection and identification of ground targets N82-27296

AEROACOUSTICS
On the design and test of a low noise propeller
[NASA-CR-165938] N82-27089

AERODYNAMIC CHARACTERISTICS
Ultralight airplanes A82-35233

The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine
[ASME PAPER 82-GT-222] A82-35409
Heat transfer measurements of a transonic nozzle guide vane
[ASME PAPER 82-GT-247] A82-35426
Heat transfer optimised turbine rotor blades - An experimental study using transient techniques
[ASME PAPER 82-GT-304] A82-35469
Transonic wind tunnel test of a supersonic nozzle installation
[AIAA PAPER 82-1045] A82-37677
Current techniques for jet engine test cell modeling
[AIAA PAPER 82-1272] A82-37712
General purpose research rotor
[AHS PREPRINT 81-9] A82-37777
Effects of wing-leading-edge modifications on a full-scale, low-wing general aviation airplane: Wind-tunnel investigation of high-angle-of-attack aerodynamic characteristics --- conducted in Langley 30- by 60-foot tunnel
[NASA-TP-2011] N82-26217
Laser anemometer measurements in an annular cascade of core turbine vanes and comparison with theory
[NASA-TP-2018] N82-26234
Steady, Oscillatory, and Unsteady Subsonic and Supersonic Aerodynamics, production version 1.1 (SOUSSA-P1.1). Volume 2: User/programmer manual. Addendum 1: Analytical treatment of wake influence
[NASA-TM-84484] N82-26236
Proceedings of the 12th Navy Symposium on Aeroballistics, volume 1
[AD-A111763] N82-27225
XH-59A ABC technology demonstrator altitude expansion and operational tests
[AD-A111114] N82-27282

Extension of FLO codes to transonic flow
prediction for fighter configurations
A82-35564
A series of airfoils designed by transonic drag
minimization for Gates Learjet aircraft
A82-35565
Applied computational transonics - Capabilities
and limitations
A82-35566
Evaluation of full potential flow methods for the
design and analysis of transport wings
A82-35567
On the vortex flow over delta and double-delta wings
[AIAA PAPER 82-0949] A82-37466
Approximate boundary condition procedure for the
two-dimensional numerical solution of vortex wakes
[AIAA PAPER 82-0951] A82-37467
A grid interfacing zonal algorithm for
three-dimensional transonic flows about aircraft
configurations
[AIAA PAPER 82-1017] A82-37477
Models for a turbulent premixed dump combustor
[AIAA PAPER 82-1261] A82-37709
Determination of rotor wake induced empennage
airloads
[AHS PREPRINT 81-26] A82-37796
COMPUTER AIDED DESIGN
CFD technology for propulsion installation design
- Forecast for the 80's --- computational fluid
dynamics in aerospace applications
[ASME PAPER 82-GT-21] A82-35289
On the influence of the number of stages on the
efficiency of axial-flow turbines
[ASME PAPER 82-GT-43] A82-35301
R & D on composite rotor blades at Agusta
A82-37764
Helicopter design synthesis
A82-37772
Life and Utilization Criteria Identification In
Design (LUCID), volume 1
[AD-A111939] N82-26309
COMPUTER AIDED MANUFACTURING
The DRAPO system - Materials means and logic
functions
A82-37521
COMPUTER GRAPHICS
Justification for, and design of, an economical
programmable multiple flight simulator
A82-36969
Flight-test verification of a pictorial display
for general aviation instrument approach
[NASA-TM-83305] N82-26288
Advanced training techniques using computer
generated imagery
[AD-A111979] N82-28007
Computer image generation: Advanced visual/sensor
simulation
[AD-A107098] N82-28016
COMPUTER NETWORKS
AUTOPILOT: A distributed planner for air fleet
control
[AD-A107139] N82-27269
COMPUTER PROGRAMMING
Commutated automatic gain control system
N82-26209
A prototype interface unit for
microprocessor-based Loran-C receiver
N82-26210
The Sortie-Generation Model system. Volume 4:
Sortie-Generation Model programmers manual
[AD-A110899] N82-26224
COMPUTER PROGRAMS
Optimization of compressor vane and bleed settings
[ASME PAPER 82-GT-81] A82-35327
An approach to software for high integrity
applications --- in aircraft gas turbine engine
control
[ASME PAPER 82-GT-251] A82-35430
Formal specification and mechanical verification
of SIFT - A fault-tolerant flight control system
A82-37446
The Sortie-Generation Model system. Volume 1:
Executive summary
[AD-A110897] N82-26222
Life and Utilization Criteria Identification In
Design (LUCID), volume 1
[AD-A111939] N82-26309
Life and Utilization Criteria Identification In
Design (LUCID), volume 2
[AD-A111940] N82-26310
Bird impact analysis package for turbine engine
fan blades
[NASA-TM-82831] N82-26701
Design of a data acquisition and reduction system
for fatigue testing
[AD-A110612] N82-26720
Scenarios for evolution of air traffic control
[AD-A112566] N82-27270
Digital command augmentation for lateral
directional aircraft dynamics
[AD-A107264] N82-27321
Panel Optimization with Integrated Software
(POIS), Volume 2. User instructions: ECHO and
ERSIS
[AD-A112224] N82-27411
Hurricane-induced wind loads
[PB82-132267] N82-27548
Software technology transfer and export control
[AD-A106869] N82-28017
COMPUTER SYSTEMS DESIGN
The computerized cockpit for the one-man crew
A82-36937
The DRAPO system - Materials means and logic
functions
A82-37521
A prototype interface unit for
microprocessor-based Loran-C receiver
N82-26210
Life and Utilization Criteria Identification In
Design (LUCID), volume 2
[AD-A111940] N82-26310
Control optimization, stabilization and computer
algorithms for aircraft applications
[NASA-CR-169015] N82-27009
The Flight Service Automation System (FSAS) system
benchmark. Volume 1: Summary, introduction and
concepts
[PB82-143538] N82-27277
Panel Optimization with Integrated Software
(POIS), Volume 2. User instructions: ECHO and
ERSIS
[AD-A112224] N82-27411
COMPUTER SYSTEMS PERFORMANCE
An analysis of selected enhancements to the en
route central computing complex
[AD-A113575] N82-28044
COMPUTER TECHNIQUES
Practical application of a computerized flight by
flight fatigue test system
A82-37768
AUTOPILOT: A distributed planner for air fleet
control
[AD-A107139] N82-27269
Scenarios for evolution of air traffic control
[AD-A112566] N82-27270
A planning system for F-16 air-to-surface missions
N82-27297
COMPUTERIZED SIMULATION
Application of high bypass turbofan computer
simulation to flight and test data processing
[ASME PAPER 82-GT-141] A82-35366
Justification for, and design of, an economical
programmable multiple flight simulator
A82-36969
A cost modeling approach to engine optimization
[AIAA PAPER 82-1185] A82-37698
Design and evaluation of a state-feedback
vibration controller
[AHS PREPRINT 81-10] A82-37783
The Sortie-Generation Model system. Volume 1:
Executive summary

The Sortie-Generation Model system. Volume 6:
Spares subsystem
[AD-A110900] N82-26226
Investigation of an improved structural model for
damaged T-38 horizontal stabilizer flutter
analysis using NASTRAN
[AD-A111095] N82-26316

Development of low-order model of an X-wing aircraft by system identification
[AD-A113760] N82-27286
System Description-Aviation Wide-Angle Visual System (AWAVS) computer image
[AD-A111800] N82-27323
Reports by Systems Technology, Inc., in support of carrier-landing research in the visual technology research simulator
[AD-A112466] N82-27324
Influence of contrast on spatial perception in TV display of moving images
[FB-50] N82-27609
Advanced training techniques using computer generated imagery
[AD-A111979] N82-28007

CONFERENCES
Jet fuel from shale oil: The 1981 technology review
[AD-A111217] N82-26484
Symposium on Commercial Aviation Energy Conservation Strategies, papers and presentations
[AD-A107106] N82-26490
Proceedings of the 12th Navy Symposium on Aeroballistics, volume 1
[AD-A111783] N82-27225
Proceedings of the 1st Annual Workshop on Aviation Related Electricity Hazards Associated with Atmospheric Phenomena and Aircraft Generated Inputs
[AD-A107326] N82-27237
Impact of Advanced Avionics Technology and Ground Attack Weapon Systems
[AGARD-CP-306] N82-27293
Proceedings of the 12th Navy Symposium on Aeroballistics, volume 2
[AD-A111783] N82-27312

CONSTRAINTS
Current ADM restraint system status, trade-off constraints and long range objectives for the Maximum Performance Ejection System (MPES)
[AD-A112645] N82-27230

CONTAINMENT
Composite containment systems for jet engines
A82-37062

CONTINUOUS WAVE RADAR
C band spectral tracking for FM/CW altimetry
A82-37035

CONTOURS
Comparison of experimental and analytical performance for contoured endwall stators
[NASA-TM-82877] N82-26299

CONTRAILS
Forecasting aircraft condensation trails
[AD-A111876] N82-26939

CONTROL
Reliability and maintainability analysis of fluidic back-up flight control system and components
[AD-A110496] N82-27320

CONTROL CONFIGURED VEHICLES
An analytical study of turbulence responses, including horizontal tail loads, of a control configured jet transport with relaxed static stability
N82-26313

CONTROL EQUIPMENT
TURBOTRANS - A programming language for the performance simulation of arbitrary gas turbine engines with arbitrary control systems
[ASME PAPER 82-GT-200] A82-35396
Simplified digital design tools
A82-37034

CONTROL SIMULATION
Evaluation of a multivariable control design on a variable cycle engine simulation
[AIAA PAPER 82-1077] A82-37682

CONTROL THEORY
A practical approach to the design of multivariable control strategies for gas turbines
[ASME PAPER 82-GT-150] A82-35374
Tactical systems approach to interdiction of 2nd echelon moving targets using real time sensors
N82-27306
Digital command augmentation for lateral directional aircraft dynamics
[AD-A107264] N82-27321

CONTROLLABILITY
Notes on lateral-directional pilot induced oscillations
[AD-A113996] N82-27322

CONTROLLERS
A practical approach to the design of multivariable control strategies for gas turbines
[ASME PAPER 82-GT-150] A82-35374

CONVECTIVE HEAT TRANSFER
Measurements of heat transfer coefficients on gas turbine components. I - Description, analysis and experimental verification of a technique for use in hostile environments
[ASME PAPER 82-GT-174] A82-35387
Measurements of heat transfer coefficients on gas turbine components. II - Applications of the technique described in part I and comparisons with results from a conventional measuring technique and predictions
[ASME PAPER 82-GT-175] A82-35388

CONVERGENT-DIVERGENT NOZZLES
Advanced exhaust nozzle concepts using spanwise blowing for aerodynamic lift enhancement
[AIAA PAPER 82-1132] A82-37692

COOLING SYSTEMS
Two-phase transpiration cooling
[ASME PAPER 82-GT-89] A82-35333
Measurements of heat transfer coefficients on gas turbine components. I - Description, analysis and experimental verification of a technique for use in hostile environments
[ASME PAPER 82-GT-174] A82-35387

CORIOLIS EFFECT
The influence of Coriolis forces on gyroscopic motion of spinning blades
[ASME PAPER 82-GT-163] A82-35384

CORRECTION
Correcting for turbulence effects on average velocity measurements made using five hole spherical pitot tube probes
[AD-A112573] N82-27290

CORROSION PREVENTION
Corrosion tests with MIL-H-83282 and MIL-H-6083 aircraft hydraulic fluids
[AD-A112437] N82-27506

CORROSION RESISTANCE
Wear by generation of electrokinetic streaming currents
[ASLE PREPRINT 82-AM-6A-3] A82-37057

CORROSION TESTS
Engine experience of turbine rotor blade materials and coatings
[ASME PAPER 82-GT-244] A82-35425

COST ANALYSIS
Specification and estimation of dynamic cost functions for airframe production airframes
[AD-A113147] N82-27221
Benefit cost analysis of the aircraft energy efficiency program
[NASA-CR-169116] N82-27200

COST EFFECTIVENESS
Specification and estimation of dynamic cost functions for airframe production airframes
[AD-A113147] N82-27221

COST ESTIMATES
Life-cycle-cost analysis of the microwave landing system ground and airborne systems
[AD-A110909] N82-26266

COST REDUCTION
Technology advancements for energy efficient aircraft engines
[AIAA PAPER 82-1051] A82-35479
Opportunities to reduce the cost of some B-52 modifications
[AD-A113563] N82-27219

COUNTER ROTATION
Development of counter-rotating intershaft support bearing technology for aircraft gas turbine engines
[AIAA PAPER 82-1054] A82-37679

COUPLING
A finite element analysis of coupled rotor fuselage vibration
[AHS PREPRINT 81-21] A82-37792

COWLINGS
Thrust reverser for a long duct fan engine --- for turbofan engines
[NASA-CASE-LEW-13199-1] N82-26293

Advanced microstrip antenna developments. Volume 2: Microstrip GPS antennas for general aviation aircraft
[AD-A113620] N82-27588
GOVERNMENT PROCUREMENT
Reduced performance and increased cost warrant reassessment of the multiple stores ejector rack
[AD-A112776] N82-27285
GRAPHITE-EPOXY COMPOSITES
Fabrication and test of integrally stiffened graphite/epoxy components
A82-37071
Application and testing of metallic coatings on graphite/epoxy composites
A82-37074
Evaluation of sensitivity of ultrasonic detection of disbonds in graphite/epoxy to metal joints
A82-37080
GRAPHITE-POLYIMIDE COMPOSITES
Geometrical aspects of the tribological properties of graphite fiber reinforced polyimide composites
[ASLE PREPRINT 82-AM-5A-2] A82-37855
Develop, demonstrate, and verify large area composite structural bonding with polyimide adhesives --- adhesively bonding graphite-polyimide structures
[NASA-CR-165839] N82-26465
GRAVITATIONAL FIELDS
Gravity induced position errors in airborne inertial navigation
[AD-A113823] N82-27272
The Earth's gravity field to degree and order 180 using SEASAT altimeter data, terrestrial gravity data and other date
[AD-A113098] N82-27900
GRAVITY ANOMALIES
Gravity induced position errors in airborne inertial navigation
[AD-A113823] N82-27272
The Earth's gravity field to degree and order 180 using SEASAT altimeter data, terrestrial gravity data and other data
[AD-A113098] N82-27900
GROOVES
Influence of casing treatment on the operating range of axial compressors
[ASME PAPER 82-GT-103] A82-35340
GROUND HANDLING
Preliminary study of ground handling characteristics of Buoyant Quad Rotor (BQR) vehicles
[NASA-CR-166130] N82-26220
GROUND STATIONS
Data processing at the Global Positioning System master control station
[AD-A110553] N82-26270
Standard engineering installation package. Air traffic radio channel control equipment: Change 1
[AD-A107150] N82-26275
GROUND SUPPORT EQUIPMENT
Frequency sharing between passive sensors and aeronautical radionavigation systems employing ground transponders in the band 4.2 - 4.4 GHz
[NASA-CR-169041] N82-26261
GROUND TESTS
T700 - Modern development test techniques, lessons learned and results
[AIAA PAPER 82-1183] A82-35048
Improved methods in ground vibration testing
[AHS PREPRINT 81-6] A82-37781
GROUND WIND
B-747 vortex alleviation flight tests: Ground-based sensor measurements
[AD-A113621] N82-27287
GUIDANCE (MOTION)
Simplified digital design tools
A82-37034
Proceedings of the 12th Navy Symposium on Aeroballistics, volume 1
[AD-A111763] N82-27225
GUIDE VANES
Comprehensive analysis of an axial compressor test with adjustable guide vanes
[ASME PAPER 82-GT-74] A82-35323
Heat transfer measurements of a transonic nozzle guide vane
[ASME PAPER 82-GT-247] A82-35426
GUST ALLEVIATORS
A gust damper --- for light passenger aircraft
A82-37127
GUST LOADS
Comparison of analytical and wind-tunnel results for flutter and gust response of a transport wing with active controls
[NASA-TP-2010] N82-26703
GUSTS
Rotor state estimation for rotorcraft
[AHS PREPRINT 81-11] A82-37784
GYROSCOPES
Gyro systems (selected pages)
[AD-A113748] N82-27271
GYROSCOPIC STABILITY
The influence of Coriolis forces on gyroscopic motion of spinning blades
[ASME PAPER 82-GT-163] A82-35384
Gyro systems (selected pages)
[AD-A113748] N82-27271

H

HANDBOOKS
Maintenance training simulator design and acquisition: Handbook of ISD procedures for design and documentation
[AD-A111430] N82-26321
HANG GLIDERS
Ultralight airplanes
A82-35233
HANGARS
Preliminary study of ground handling characteristics of Buoyant Quad Rotor (BQR) vehicles
[NASA-CR-166130] N82-26220
HARMONIC EXCITATION
Development and validation of preliminary analytical models for aircraft interior noise prediction
A82-38077
HARMONIC OSCILLATION
Optimization of blade pitch angle for higher harmonic rotor control
A82-37776
HARRIER AIRCRAFT
An oxygen enriched air system for the AV-8A Harrier
[AD-A112334] N82-27239
HEAD-UP DISPLAYS
Wide angle raster head up display design and application to future single seat fighters
N82-27304
HEAT FLUX
Turbine stage heat flux measurements
[AIAA PAPER 82-1289] A82-35102
HEAT MEASUREMENT
Turbine stage heat flux measurements
[AIAA PAPER 82-1289] A82-35102
Measurements of heat transfer coefficients on gas turbine components. I - Description, analysis and experimental verification of a technique for use in hostile environments
[ASME PAPER 82-GT-174] A82-35387
Measurements of heat transfer coefficients on gas turbine components. II - Applications of the technique described in part I and comparisons with results from a conventional measuring technique and predictions
[ASME PAPER 82-GT-175] A82-35388
HEAT OF FUSION
Microwave ice prevention
N82-26203
HEAT RESISTANT ALLOYS
A two-dimensional boundary-layer program for turbine airfoil heat transfer calculation
[ASME PAPER 82-GT-93] A82-35336
Engine experience of turbine rotor blade materials and coatings
[ASME PAPER 82-GT-244] A82-35425
Hot isostatically pressed manufacture of high strength MERL 76 disk and seal shapes
[NASA-CR-165549] N82-26439
HEAT TRANSFER
Turbine stage heat flux measurements
[AIAA PAPER 82-1289] A82-35102
Two-phase transpiration cooling
[ASME PAPER 82-GT-89] A82-35333

A two-dimensional boundary-layer program for turbine airfoil heat transfer calculation A82-35336
[ASME PAPER 82-GT-93]
Heat transfer optimised turbine rotor blades - An experimental study using transient techniques A82-35469

Wide field of view laser beacon system for three dimensional aircraft range measurements N82-26216
HIGH PRESSURE
Plain-jet airblast atomization of alternative liquid petroleum fuels under high ambient air pressure conditions A82-35293
[ASME PAPER 82-GT-32]
Casing treatments on a supersonic diffuser for high pressure ratio centrifugal compressors A82-35331
[ASME PAPER 82-GT-85]
HIGH SPEED
Summary and recent results from the NASA advanced High Speed Propeller Research Program N82-26219
[NASA-TM-82891]
HIGH TEMPERATURE TESTS
Development of hybrid gas turbine basket technology A82-35337
[ASME PAPER 82-GT-94]
The effect of NaCl/g/ in high temperature oxidation A82-35382
[ASME PAPER 82-GT-168]
HINGES
Hinged strake aircraft control system N82-26270
[NASA-CASE-LAR-12860-1]

RECONNAISSANCE AIRCRAFT
The influence of engine characteristics on patrol aircraft life cycle cost optimization
[ASME PAPER 82-GT-256] A82-35433
RECTANGLES
Wind tunnel measurements of three-dimensional wakes of buildings --- for aircraft safety applications
[NASA-CR-3565] N82-26921
RECTANGULAR WINGS
Chordwise and compressibility corrections for arbitrary planform slender wings
A82-37931

REDUCED GRAVITY
The Marshall Space Flight Center KC-135 zero gravity test program for FY 1981
[NASA-TM-82476] N82-26350
REDUNDANCY
Air data measurement using distributed processing and fiber optics data transmission
N82-26214

REDUNDANT COMPONENTS
Reliability and maintainability analysis of fluidic back-up flight control system and components
[AD-A110496] N82-27320
REENTRY TRAJECTORIES
Application of adaptive estimation to target tracking
[AD-A112036] N82-26272
REFINING
Evaluating the effectiveness of hydrorefining of the low-stability component of T-1 fuel
A82-36673

REFRIGERATING MACHINERY
Cryogenic turbine testing
[ASME PAPER 82-GT-113] A82-35346
REFSAT
Study of the global positioning system for maritime concepts/applications: Study of the feasibility of replacing maritime shipborne navigation systems with NAVSTAR
[NASA-CR-169031] N82-26263
REGRESSION COEFFICIENTS
General purpose research rotor
[AHS PREPRINT 81-9] A82-37777
REGULATIONS
Final regulatory evaluation: Metropolitan Washington Airports Policy
[AD-A110583] N82-26324
Transportation noise, its impact, planning and regulation
[S-258] N82-27864
Software technology transfer and export control
[AD-A106869] N82-28017
REINFORCED PLASTICS
Fabrication and test of integrally stiffened graphite/epoxy components
A82-37071

RELAXATION METHOD (MATHEMATICS)
Analysis of two-dimensional internal flows using a primitive-variable relaxation Navier-Stokes procedure
[AIAA PAPER 82-1083] A82-34998
RELIABILITY
Reliability and maintainability analysis of fluidic back-up flight control system and components
[AD-A110496] N82-27320
RELIABILITY ANALYSIS
Formal specification and mechanical verification of SIFT - A fault-tolerant flight control system
A82-37446

RELIABILITY ENGINEERING
Next generation trainer /NGT/ engine requirements - An application of lessons learned
[AIAA PAPER 82-1164] A82-35049
REMOVAL
Efficient part removal processes --- from molds
A82-37097

RESEARCH AND DEVELOPMENT
NASA/General Electric broad-specification fuels combustion technology program - Phase I results and status
[AIAA PAPER 82-1089] A82-35000
Development of engine operability
[AIAA PAPER 82-1181] A82-35046
The potential impact of future fuels on small gas turbine engines
[ASME PAPER 82-GT-133] A82-35362
Status report of the USAF's Engine Model Derivative Program
[ASME PAPER 82-GT-183] A82-35391
R & D on composite rotor blades at Agusta
A82-37764

The Helicopter Ride Revolution
[AHS PREPRINT 81-4] A82-37780
A technical assessment of aeronautical engineering in Israel

ROTATING DISKS
Analysis of rotating structures using image
derotation with multiple pulsed lasers and moire
techniques
A82-36999
ROTATING SHAFTS
Transient vibration of high speed lightweight
rotor due to sudden imbalance
[ASME PAPER 82-GT-231] A82-35413
ROTOR AERODYNAMICS
Aerodynamic performance of high turning core
turbine vanes in a two-dimensional cascade
[AIAA PAPER 82-1288] A82-37716
General purpose research rotor
[AHS PREPRINT 81-9] A82-37777
Rotor state estimation for rotorcraft
[AHS PREPRINT 81-11] A82-37784
Substructure program for analysis of helicopter
vibrations
[AHS PREPRINT 81-24] A82-37795
Determination of rotor wake induced empennage
airloads
[AHS PREPRINT 81-26] A82-37796
User's manual for the vertical axis wing turbine
code VDART2
[DE82-000796] N82-26828
ROTOR BLADES
R & D on composite rotor blades at Agusta
A82-37764
Joint Anglo-American experience of the analysis of
helicopter rotor blade pressure distribution
A82-37770
Optimization of blade pitch angle for higher
harmonic rotor control
A82-37776
A simple system for helicopter
individual-blade-control and its application to
stall-induced vibration alleviation
[AHS PREPRINT 81-12] A82-37785
XH-59A ABC technology demonstrator altitude
expansion and operational tests
[AD-A111114] N82-27282
ROTOR BLADES (TURBOMACHINERY)
Investigation of blade vibration of radial
impellers by means of telemetry and holographic
interferometry
[ASME PAPER 82-GT-38] A82-35295
A critical appraisal of some current incidence
loss models for the stator and rotor of a mixed
flow gas turbine
[ASME PAPER 82-GT-120] A82-35350
Transient vibration of high speed lightweight
rotor due to sudden imbalance
[ASME PAPER 82-GT-231] A82-35413
Engine experience of turbine rotor blade materials
and coatings
[ASME PAPER 82-GT-244] A82-35425
Heat transfer optimized turbine rotor blades - An
experimental study using transient techniques
[ASME PAPER 82-GT-304] A82-35469
Rotor fragment protection program: Statistics on
aircraft gas turbine engine rotor failures that
occurred in U.S. commercial aviation during 1978
[NASA-CR-165388] N82-27316
ROTOR SPEED
Transient vibration of high speed lightweight
rotor due to sudden imbalance
[ASME PAPER 82-GT-231] A82-35413
ROTORS
Experimental evaluation of squeeze film supported
flexible rotors
[ASME PAPER 82-GT-233] A82-35415
Wide field of view laser beacon system for three
dimensional aircraft range measurements
N82-26216
Rotor fragment protection program: Statistics on
aircraft gas turbine engine rotor failures that
occurred in U.S. commercial aviation during 1978
[NASA-CR-165388] N82-27316
RP-1 ROCKET PROPELLANTS
Deposit formation in hydrocarbon fuels
[ASME PAPER 82-GT-49] A82-35307
RUNWAY LIGHTS
Microwave Landing System flare subsystem test
[AD-A107327] N82-27263
RUNWAYS
Dynamic scheduling of runway operations
N82-26200

S

SAFETY FACTORS
Cabin safety in large transport aircraft
[PB82-129297] N82-27244
SAMARIUM
Torsional stiffness element based on
cobalt-samarium magnets --- for a turn and bank
indicator

AEROSPACE SYSTEMS
Lightning simulation and testing
A82-35733
AEROSPACEPLANES
A concept for light-powered flight
[AIAA PAPER 82-1214] A82-35067
AEROTHERMODYNAMICS
Small turbine engine augmentor design methodology
[AIAA PAPER 82-1179] A82-35044
Test facility and data handling system for the development of axial compressors
[ASME PAPER 82-GT-73] A82-35322
AFTERBURNING
Small turbine engine augmentor design methodology
[AIAA PAPER 82-1179] A82-35044
AGING (MATERIALS)
Ageing of composite rotor blades
A82-37771
AGRICULTURAL AIRCRAFT
Briefs of accidents involving aerial application operations, U.S. general aviation, 1979
[PB82-138983] N82-27256
AH-1G HELICOPTER
Joint Anglo-American experience of the analysis of helicopter rotor blade pressure distribution
A82-37770
Improved methods in ground vibration testing
[AHS PREPRINT 81-6] A82-37781
AIR CARGO
Advanced internal cargo system concept demonstration and evaluation
[AD-A111990] N82-26282
AIR COOLING
The effect of coolant flow on the efficiency of a transonic HP turbine profile suitable for a small engine
[ASME PAPER 82-GT-63] A82-35315
AIR DEFENSE
The PATRIOT Radar in tactical air defense
A82-37031

AIR FLOW
Semi-empirical analysis of liquid fuel distribution downstream of a plain orifice injector under cross-stream air flow
[ASME PAPER 82-GT-16] A82-35285
Gas turbine airflow control for optimum heat recovery
[ASME PAPER 82-GT-83] A82-35329
AIR JETS
Plain-jet airblast atomization of alternative liquid petroleum fuels under high ambient air pressure conditions
[ASME PAPER 82-GT-32] A82-35293
Local heat transfer to staggered arrays of impinging circular air jets
[ASME PAPER 82-GT-211] A82-35401
Digital spectral analysis of the noise from short duration impulsively started jets
A82-36191
AIR LAW
The DC-10 Chicago crash and the legality of SFAR 40
A82-37832
The recognition of air worthiness of aircraft - Comments to a remarkable judicial decision
A82-38025
AIR NAVIGATION
Certification of an airborne Loran-C navigation system
A82-35876
Prospects for Navsat - A future worldwide civil navigation-satellite system
A82-36047
FAA tests on the Navstar GPS Z-set
A82-37039
Joint University Program Air for Transportation Research, 1981
[NASA-CP-2224] N82-26199
PPOD Programmable pilot-oriented display --- air navigation
N82-26201
The P-POD Project --- error detection codes
N82-26202
Investigation of air transportation technology at Ohio University, 1981 --- loran
N82-26204
Loran-C plotting program for plotting lines of position on standard charts
N82-26206
A Loran-C prototype navigation receiver for general aviation
N82-26207
A Loran-C prototype navigation receiver for general aviation
N82-26208
Investigation of air transportation technology at Princeton University, 1981
N82-26212
Modification of OE-258/URN Tactical Air Navigation (TACAN) antenna group
[AD-A111680] N82-26264
AIR POLLUTION
Smoke reduction in PJR-710 turbofan engines by an airblast combustor
[ASME PAPER 82-GT-24] A82-35290
Fuel microemulsions for jet engine smoke reduction
[ASME PAPER 82-GT-33] A82-35294
Control of air pollution from aviation: The emission standard setting process
[AD-A107435] N82-27869
AIR PURIFICATION
Small engine inlet air particle separator technology
[ASME PAPER 82-GT-40] A82-35299
AIR QUALITY
An oxygen enriched air system for the AV-8A Harrier
[AD-A112334] N82-27239
Control of air pollution from aviation: The emission standard setting process
[AD-A107435] N82-27869
AIR TO SURFACE MISSILES
Impact of advanced avionics and munitions technology on ground attack weapons systems in night and adverse weather conditions
N82-27294
AIR TRAFFIC
Cockpit display of traffic information and the measurement of pilot workload: An annotated bibliography
[AD-A113637] N82-27291
Control of air pollution from aviation: The emission standard setting process
[AD-A107435] N82-27869
AIR TRAFFIC CONTROL
Justification for, and design of, an economical programmable multiple flight simulator
A82-34969
Traffic flow control in the Frankfurt/Main airport area
A82-37526
Dynamic scheduling of runway operations
N82-26200
Comparison between the surveillance performances of the Air Traffic Control Radar Beacon System mode of the Mode S and the Automated Radar Terminal System
[AD-A111733] N82-26273
Standard engineering installation package. Air traffic radio channel control equipment: Change 1
[AD-A107150] N82-26275
Airfield and airspace capacity/delay policy analysis
[AD-A110777] N82-26326
Marine Air Traffic Control and Landing System (MATCALS) investigation
[AD-A107384] N82-27260
High-speed rotary printing device for air traffic control applications: A preliminary evaluation
[AD-A107325] N82-27264
Design and implementation of efficient algorithms for automatic determination of corrected slant range
[AD-A112248] N82-27267
Terminal air traffic control with surveillance data from the mode 5 system: Results of system demonstrations to field controllers
[AD-A112632] N82-27268
AUTOPILOT: A distributed planner for air fleet control
[AD-A107139] N82-27269
Marine Air Traffic Control and Landing System (MATCALS) investigation
[AD-A113047] N82-27276
An analysis of selected enhancements to the en route central computing complex
[AD-A113575] N82-28044
AIR TRANSPORTATION
Investigation of air transportation technology at Princeton University, 1981
N82-26212
Final regulatory evaluation: Metropolitan Washington Airports Policy
[AD-A110583] N82-26324
Cold regions testing of an air transportable shelter
[AD-A107131] N82-27325
AIRBORNE EQUIPMENT
Airborne warning systems for natural and aircraft-initiated lightning
A82-35729
Certification of an airborne Loran-C navigation system
A82-35876
A single-frequency multitransmitter telemetry technique
A82-36281
An accurate Doppler navigator with microwave simplicity
A82-37037
Medium PRF performance analysis --- Pulse-Repetition Frequency
A82-37378
Air-ground attack: Axes of research for airborne systems
N82-27295
Protection of electrical systems from EM hazards: Design guide
[AD-A112707] N82-27659
AIRBORNE RADAR APPROACH
Real-time simulation of an airborne radar for overwater approaches
[NASA-CR-166293] N82-26262
AIRBORNE/SPACEBORNE COMPUTERS
An approach to software for high integrity applications --- in aircraft gas turbine engine control
[ASME PAPER 82-GT-251] A82-35430
PPOD Programmable pilot-oriented display --- air navigation
N82-26201

CRACK INITIATION
Turbine blade nonlinear structural and life analysis
[AIAA PAPER 82-1056] A82-34981
CRACK PROPAGATION
A procedure for evaluating fuel composition effects on combustor life
[ASME PAPER 82-GT-296] A82-35465
Mechanical property characterization and modeling of structural materials --- for airframes and aircraft gas turbine engines
[AD-A113841] N82-27784
CRASH INJURIES
Briefs of fatal accidents involving fixed-wing multi-engine aircraft, U.S. General Aviation, 1979
[PB82-139007] N82-27254
CRASH LANDING
Will hydrogen-fueled aircraft be safe
[AIAA PAPER 82-1236] A82-35077
CRASHWORTHINESS
Quasi-static and dynamic crushing of energy absorbing materials and structural components with the aim of improving helicopter crashworthiness
A82-37769
Cabin safety in large transport aircraft
[PB82-129297] N82-27244
CREW STATIONS
Tanker Avionics/Aircrew Complement Evaluation (TAACE). Phase 1: Simulation evaluation. Volume 2: Crew system design
[AD-A110954] N82-26251
CROSS FLOW
Semi-empirical analysis of liquid fuel distribution downstream of a plain orifice injector under cross-stream air flow
[ASME PAPER 82-GT-16] A82-35285
Effect of crossflows on the discharge coefficient of film cooling holes
[ASME PAPER 82-GT-147] A82-35371
Flows over wings with leading-edge vortex separation
[NASA-CR-165858] N82-26238
CRUISE MISSILES
Prediction of cruise missile inlet peak instantaneous distortion patterns from steady state and turbulence data using a statistical technique
[AIAA PAPER 82-1085] A82-37685
CRUISING FLIGHT
Commercial transports - Aerodynamic design for cruise performance efficiency
A82-35555
CRYOGENIC EQUIPMENT
Performance of the AEDC Mark 1 Aerospace Environmental Chamber without oil diffusion pumping
[AD-A111406] N82-26322
CRYOGENICS
Cryogenic turbine testing
[ASME PAPER 82-GT-113] A82-35346
CRYOPUMPING
Performance of the AEDC Mark 1 Aerospace Environmental Chamber without oil diffusion pumping
[AD-A111406] N82-26322
CRYPTOGRAPHY
Implementing aircraft identification schemes by public key cryptosystems
A82-37381
CRYSTAL GROWTH
The Marshall Space Flight Center KC-135 zero gravity test program for FY 1981
[NASA-TM-82476] N82-26350
CURRENT DENSITY
Wear by generation of electrokinetic streaming currents
[ASLE PREPRINT 82-AM-6A-3] A82-37857
CURVED PANELS
A research program to reduce interior noise in general aviation airplanes. Influence of depressurization and damping material on the noise reduction characteristics of flat and curved stiffened panels
[NASA-CR-169035] N82-27088
CYCLIC LOADS
Yawing of wind turbines with blade cyclic-pitch variation
[DE81-029639] N82-26822
CYLINDRICAL ANTENNAS
Modification of OE-258/URN Tactical Air Navigation (TACAN) antenna group
[AD-A111680] N82-26264
CYLINDRICAL BODIES
Development and validation of preliminary analytical models for aircraft interior noise prediction
A82-38077

D

DAMPERS
A gust damper --- for light passenger aircraft
A82-37127
DAMPING
Comparison of analytical and wind-tunnel results for flutter and gust response of a transport wing with active controls
[NASA-TP-2010] N82-26703
A research program to reduce interior noise in general aviation airplanes. Influence of depressurization and damping material on the noise reduction characteristics of flat and curved stiffened panels
[NASA-CR-169035] N82-27088
DAMPING TESTS
Dry friction damping mechanisms in engine blades
[ASME PAPER 82-GT-162] A82-35383
DATA ACQUISITION
Test facility and data handling system for the development of axial compressors
[ASME PAPER 82-GT-73] A82-35322
Acquisition of F-100/3/ high pressure compressor entrance profiles
[ASME PAPER 82-GT-215] A82-35402
A single-frequency multitransmitter telemetry technique
A82-36281
Design of a data acquisition and reduction system for fatigue testing
[AD-A110612] N82-26720
DATA BASES
The Sortie-Generation Model system. Volume 6: Spares subsystem
[AD-A110900] N82-26226
DATA PROCESSING
Flying qualities criteria for GA single pilot IFR operations
N82-26213
Data processing at the Global Positioning System master control station
[AD-A110553] N82-26270
An analysis of selected enhancements to the en route central computing complex
[AD-A113575] N82-28044
DATA REDUCTION
Design of a data acquisition and reduction system for fatigue testing
[AD-A110612] N82-26720
DATA SYSTEMS
PMUX - The interface for engine data to AIDS --- propulsion multiplexer in Aircraft Integrated Data System
[AIAA PAPER 82-1127] A82-35022
DATA TRANSMISSION
The P-FOD Project --- error detection codes
N82-26202
Air data measurement using distributed processing and fiber optics data transmission

DIESEL FUELS
Mobility fuels for the Navy
[AD-A112511] N82-26485
Development of Army high-energy fuel
diesel/turbine-powered surface equipment, phase 2
[AD-A111942] N82-26487
DIFFRACTION
Elevation plane analysis of on-aircraft antennas
[AD-A112373] N82-26554
DIFFUSERS
Analysis of two-dimensional internal flows using a
primitive-variable relaxation Navier-Stokes
procedure
[AIAA PAPER 82-1083] A82-34990
Improved vane-island diffusers at high swirl
[ASME PAPER 82-GT-68] A82-35318
Net shape components for small gas turbine engines
[ASME PAPER 82-GT-96] A82-35338
Design and investigations of a three dimensionally
twisted diffuser for centrifugal compressors
[ASME PAPER 82-GT-102] A82-35339
Development and application of a performance
prediction method for straight rectangular
diffuser
[ASME PAPER 82-GT-122] A82-35352
DIGITAL COMMAND SYSTEMS
An advanced helicopter engine control system
[ASME PAPER 82-GT-250] A82-35429
DIGITAL COMPUTERS
Digital command augmentation for lateral
directional aircraft dynamics
[AD-A107264] N82-27321
DIGITAL DATA
Digital spectral analysis of the noise from short
duration impulsively started jets
A82-36191
DIGITAL SIMULATION
Advancements in real-time engine simulation
technology --- of digital electronic aircraft
engine controls
[AIAA PAPER 82-1075] A82-34995
DIGITAL SYSTEMS
Simplified digital design tools
A82-37034
Flight evaluation of a digital electronic engine
control system in an F-15 airplane
[AIAA PAPER 82-1080] A82-37683
Electronic control for small engines
[AIAA PAPER 82-1126] A82-37688
Attack and en route avionics for in-weather
operations
N82-27300
Digital image processing for acquisition,
tracking, hand off and ranging
N82-27303
Quiet Short-Haul Research Airplane (QSRA) model
select panel functional description
[NASA-TM-84243] N82-27319
DIPOLE ANTENNAS
A balanced active antenna and impulse noise
blanket system for the Raydist T radio
navigation receiver
[AD-A114074] N82-27275
DIRECT CURRENT
Effects of high voltage transmission lines on
non-directional beacon performance
[AD-A112311] N82-27261
DISCHARGE COEFFICIENT
Effect of crossflows on the discharge coefficient
of film cooling holes
[ASME PAPER 82-GT-147] A82-35371
DISCRETE ADDRESS BEACON SYSTEM
Comparison between the surveillance performances
of the Air Traffic Control Radar Beacon System
mode of the Mode S and the Automated Radar
Terminal System
[AD-A111733] N82-26273
Surveillance simulation testing of terminal and en
route mode S sensors
[AD-A112250] N82-27265
Mode S system accuracy
[AD-A112249] N82-27266
DISKS (SHAPES)
Hot isostatically pressed manufacture of high
strength MERL 76 disk and seal shapes
[NASA-CR-165549] N82-26439
DISPLAY DEVICES
A prototype interface unit for
microprocessor-based Loran-C receiver
N82-26210
Tanker Avionics/Aircrew Complement Evaluation
(TAACE). Phase 1: Simulation evaluation.
Volume 1: Results
[AD-A110956] N82-26290
Visual technology research simulator, visual and
motion system dynamics
[AD-A111801] N82-26325
Aircraft alerting systems standardization study.
Volume 1: Candidate system validation and
time-critical display evaluation
[AD-A107225] N82-27236
Scenarios for evolution of air traffic control
[AD-A112566] N82-27270
Cockpit display of traffic information and the
measurement of pilot workload: An annotated
bibliography
[AD-A113637] N82-27291
Advanced technology and fighter cockpit design:
Which drives which?
N82-27302
Influence of contrast on spatial perception in TV
display of moving images
[FB-50] N82-27609

HOLOGRAPHIC INTERFEROMETRY
Investigation of blade vibration of radial impellers by means of telemetry and holographic interferometry
[ASME PAPER 82-GT-34] A82-35295
Analysis of rotating structures using image derotation with multiple pulsed lasers and moire techniques
A82-36999
Operating manual holographic interferometry system for 2 x 2 foot transonic wind tunnel
[NASA-CR-166344] N82-26218
HOMING
A model for sensor-interceptor trade-off analysis
[AD-A112046] N82-26271
HORIZONTAL TAIL SURFACES
Fabrication and test of integrally stiffened graphite/epoxy components
A82-37071
HOT CORROSION
The effect of NaCl/g/ in high temperature oxidation
[ASME PAPER 82-GT-106] A82-35342
HOT PRESSING
Hot isostatically pressed manufacture of high strength MERL 76 disk and seal shapes
[NASA-CR-165549] N82-26439
HOT-WIRE FLOWMETERS
Turbulence measurements in a confined jet using a six-orientation hot-wire probe technique
[AIAA PAPER 82-1262] A82-37710
HOUSINGS
Ceramic turbine housings
[ASME PAPER 82-GT-293] A82-35463
HOVERING
A finite element analysis of coupled rotor fuselage vibration
[AHS PREPRINT 81-21] A82-37792
HUBS
Monofilar - A dual frequency rotorhead absorber
[AHS PREPRINT 81-20] A82-37791
HUMAN FACTORS ENGINEERING
Justification for, and design of, an economical programmable multiple flight simulator
A82-36969
Current ADM restraint system status, trade-off constraints and long range objectives for the Maximum Performance Ejection System (MPES)
[AD-A112645] N82-27238
Proposed research tasks for the reduction of human error in naval aviation mishaps
[AD-A112339] N82-27241
Development of a backpack survival kit for ejection seats
[AD-A113653] N82-27242
Advanced technology and fighter cockpit design: Which drives which?
N82-27302
HYBRID STRUCTURES
Use of CGHRP in transport --- Carbon and Glass Hybrid Reinforced Plastics
A82-37061
HYDRAULIC CONTROL
Wear by generation of electrokinetic streaming currents
[ASLE PREPRINT 82-AM-6A-3] A82-37857
HYDRAULIC EQUIPMENT
Design guide for aircraft hydraulic systems and components for use with chlorotrifluorethylene nonflammable hydraulic fluids
[AD-A112097] N82-26283
HYDRAULIC FLUIDS
Design guide for aircraft hydraulic systems and components for use with chlorotrifluorethylene nonflammable hydraulic fluids
[AD-A112097] N82-26283
Corrosion tests with MIL-H-83282 and MIL-H-6083 aircraft hydraulic fluids
[AD-A112437] N82-27506
HYDROCARBON COMBUSTION
Numerical and experimental examination of a prevaporized/premixed combustor
[AIAA PAPER 82-1074] A82-34994
HC and CO emission abatement via selective fuel injection
[ASME PAPER 82-GT-178] A82-35390
HYDROCARBON FUELS
Deposit formation in hydrocarbon fuels
[ASME PAPER 82-GT-49] A82-35307
Carbon formation by the pyrolysis of gas turbine fuels in preflame regions of gas turbine combustors
[ASME PAPER 82-GT-84] A82-35330
HYDROCRACKING
Evaluation of hydrocracking catalysts for conversion of whole shale oil into high yields of jet fuels
[AD-A112820] N82-27523
HYDROGEN FUELS
Will hydrogen-fueled aircraft be safe
[AIAA PAPER 82-1236] A82-35077
HYDROGRAPHY
The Hydrographic Airborne Laser Sounder (HALS)
[AD-A111027] N82-26660
HYPERSONIC FLOW
Comparison of numerical results and measured data for smooth and indented nosetips
[AD-A111794] N82-26619

I

IBM COMPUTERS
An analysis of selected enhancements to the en route central computing complex
[AD-A113575] N82-28044
ICE FORMATION
Icing conditions on sea level gas turbine engine test stands
[AIAA PAPER 82-1237] A82-35078
Limited artificial and natural icing tests production UH-60A helicopter (re-evaluation)
[AD-A112582] N82-26287
Aerodynamic investigations to determine possible ice flight paths
[NASA-TM-76648] N82-27235
Response of cloud microphysical instruments to aircraft icing conditions
[AD-A112317] N82-27284
ICE PREVENTION
Icing conditions on sea level gas turbine engine test stands
[AIAA PAPER 82-1237] A82-35078
Microwave ice prevention
N82-26203
Limited artificial and natural icing tests production UH-60A helicopter (re-evaluation)
[AD-A112582] N82-26287
ICE REPORTING
Response of cloud microphysical instruments to aircraft icing conditions
[AD-A112317] N82-27284
IDENTIFYING
Implementing aircraft identification schemes by public key cryptosystems
A82-37381
IGNITION
Models for a turbulent premixed dump combustor
[AIAA PAPER 82-1261] A82-37709
IMAGE CONTRAST
Influence of contrast on spatial perception in TV display of moving images
[IB-50] N82-27609
IMAGE PROCESSING
Visual technology research simulator, visual and motion system dynamics
[AD-A111801] N82-26325
Some potential novel approaches to the automatic airborne detection and identification of ground targets
N82-27296
Digital image processing for acquisition, tracking, hand off and ranging
N82-27303
IMAGING TECHNIQUES
Laser application in weapon guidance and active imaging
A82-35767
Advanced training techniques using computer generated imagery
[AD-A111979] N82-28007
Computer image generation: Advanced visual/sensor simulation
[AD-A107098] N82-28016
IMPACT DAMAGE
Bird impact analysis package for turbine engine fan blades
[NASA-TM-82831] N82-26701

Foreign object impact design criteria, volume 2
[AD-A112701] N82-27313
Foreign object impact design criteria, volume 3
[AD-A112447] N82-27314

IMPACT LOADS
Transient vibration of high speed lightweight rotor due to sudden imbalance
[ASME PAPER 82-GT-231] A82-35413

IMPELLERS
Investigation of blade vibration of radial impellers by means of telemetry and holographic interferometry
[ASME PAPER 82-GT-34] A82-35295
Experimental investigations on the flow in the impeller of a centrifugal fan
[ASME PAPER 82-GT-37] A82-35298
Secondary flow mixing losses in a centrifugal impeller
[ASME PAPER 82-GT-44] A82-35302
The influence of flow rate on the wake in a centrifugal impeller
[ASME PAPER 82-GT-45] A82-35303
On the performance prediction of a centrifugal compressor scaled up
[ASME PAPER 82-GT-112] A82-35345
Effect of impeller extended shrouds on centrifugal compressor performance as a function of specific speed
[ASME PAPER 82-GT-226] A82-35411

IN-FLIGHT MONITORING
Flying qualities criteria for GA single pilot IFR operations N82-26213

INCOMPRESSIBLE FLOW
The numerical solution of the Navier-Stokes equations for incompressible turbulent flow over airfoils
[AD-A111279] N82-26612

INDUSTRIAL ENERGY
Gas turbine airflow control for optimum heat recovery
[ASME PAPER 82-GT-83] A82-35329

INERTIA
Semi-active fluid inertia - A new concept in vibration isolation
[AHS PREPRINT 81-17] A82-37789

INERTIAL GUIDANCE
Gyro systems (selected pages)
[AD-A113748] N82-27271

INERTIAL NAVIGATION
Gravity induced position errors in airborne inertial navigation
[AD-A113823] N82-27272

INFORMATION DISSEMINATION
Software functional description of mass weather dissemination system exploratory engineering model
[AD-A112706] N82-27573

INFRARED IMAGERY
Automatic handoff of multiple targets
[AD-A107490] N82-27561

INLET FLOW
The effect of inlet distortion on the performance characteristics of a centrifugal compressor
[ASME PAPER 82-GT-92] A82-35335
Prediction of cruise missile inlet peak instantaneous distortion patterns from steady state and turbulence data using a statistical technique
[AIAA PAPER 82-1085] A82-37685
Current status of inlet flow prediction methods
[AD-A111784] N82-26311
Acoustic properties of turbofan inlets
[NASA-CR-169016] N82-27090

INLET NOZZLES
Selected results of the F-15 propulsion interactions program
[AIAA PAPER 82-1041] A82-34976
F-14 inlet development experience
[ASME PAPER 82-GT-5] A82-35278
Development and application of a performance prediction method for straight rectangular diffuser
[ASME PAPER 82-GT-122] A82-35352

INLET PRESSURE
Acquisition of F-100/3/ high pressure compressor entrance profiles
[ASME PAPER 82-GT-215] A82-35402

INPUT/OUTPUT ROUTINES
Input/output models for general aviation piston-prop aircraft fuel economy N82-26215
A floating-point/multiple-precision processor for airborne applications
[NASA-TM-84252] N82-26289

INSTRUMENT LANDING SYSTEMS
Flight-test verification of a pictorial display for general aviation instrument approach
[NASA-TM-83305] N82-26288

INTAKE SYSTEMS
Current status of inlet flow prediction methods
[AD-A111784] N82-26311

INTELLIGIBILITY
A comparative study of narrowband vocoder algorithms in Air Force operational environments using the Diagnostic Rhyme Test
[AD-A112053] N82-26586

INTERCEPTION
A model for sensor-interceptor trade-off analysis
[AD-A112046] N82-26271
Quasilinearization solution of the proportional navigation problem
[AD-A113668] N82-27273

INTERFACES
The Flight Service Automation System (FSAS) system benchmark. Volume 3: The vendor interface package
[PB82-143553] N82-27279

INTERMITTENCY
Development potential of Intermittent Combustion (I.C.) aircraft engines for commuter transport applications
[NASA-TM-82869] N82-26297

INTERNAL COMBUSTION ENGINES
Development potential of Intermittent Combustion (I.C.) aircraft engines for commuter transport applications
[NASA-TM-82869] N82-26297

INTERNATIONAL LAW
The recognition of air worthiness of aircraft - Comments to a remarkable judicial decision A82-38025

INTERNATIONAL TRADE
Software technology transfer and export control
[AD-A106869] N82-28017

INTERPROCESSOR COMMUNICATION
Joint University Program Air for Transportation Research, 1981
[NASA-CP-2224] N82-26199
The F-POD Project --- error detection codes N82-26202

INTOXICATION
Briefs of accidents involving alcohol as a cause/factor, U.S. general aviation, 1979
[PB82-138942] N82-27247

INVENTORY MANAGEMENT
The Sortie-Generation Model system. Volume 6: Spares subsystem
[AD-A110900] N82-26226

INVISCID FLOW
An inviscid-viscous interaction treatment to predict the blade-to-blade performance of axial compressors with leading edge normal shock waves
[ASME PAPER 82-GT-135] A82-35363

IONOSPHERES
The effect of ionospheric variability on the accuracy of high frequency position location
[AD-A107425] N82-26274

IONOSPHERIC DISTURBANCES
The effect of ionospheric variability on the accuracy of high frequency position location
[AD-A107425] N82-26274

IONOSPHERIC PROPAGATION
The effect of ionospheric variability on the accuracy of high frequency position location
[AD-A107425] N82-26274

ISOSTATIC PRESSURE
Hot isostatically pressed manufacture of high strength MERL 76 disk and seal shapes
[NASA-CR-165549] N82-26435

SEATS
Army helicopter crew seat vibration - Past performance, future requirements [AHS PREPRINT 81-3] A82-37779
Opportunities exist to achieve greater standardization of aircraft and helicopter seats [AD-A111718] N82-26259
SECONDARY FLOW
Experimental study of the effects of secondary air on the emissions and stability of a lean premixed combustor [AIAA PAPER 82-1072] A82-34992
Secondary flows and losses in axial flow turbines [ASME PAPER 82-GT-19] A82-35288
Secondary flow mixing losses in a centrifugal impeller [ASME PAPER 82-GT-44] A82-35302
Secondary flow effects and mixing of the wake behind a turbine stator [ASME PAPER 82-GT-46] A82-35304
SELF LUBRICATING MATERIALS
Performance of PTFE-lined composite journal bearings [ASLE PREPRINT 82-AM-1A-1] A82-37854
SEPARATED FLOW
Flows over wings with leading-edge vortex separation [NASA-CR-165858] N82-26238
SEPARATORS
Small engine inlet air particle separator technology [ASME PAPER 82-GT-40] A82-35299
SERIES EXPANSION
A mixed-flow cascade passage design procedure based on a power series expansion [ASME PAPER 82-GT-121] A82-35351
SERVICE LIFE
A procedure for evaluating fuel composition effects on combustor life [ASME PAPER 82-GT-296] A82-35465
Life and Utilization Criteria Identification In Design (LUCID), volume 1 [AD-A111939] N82-26309
Life and Utilization Criteria Identification In Design (LUCID), volume 2 [AD-A111940] N82-26310
SERVOMECHANISMS
Reliability and maintainability analysis of fluidic back-up flight control system and components [AD-A110496] N82-27320
SHAFTS (MACHINE ELEMENTS)
The effect of journal misalignment on the oil-film forces generated in a squeeze-film damper [ASME PAPER 82-GT-285] A82-35457
Development of counter-rotating intershaft support bearing technology for aircraft gas turbine engines [AIAA PAPER 82-1054] A82-37679
CFC drive shaft and GFC coupling for the tail rotor of the BO 105 A82-37766
SHALE OIL
Jet fuel from shale oil: The 1981 technology review [AD-A111217] N82-26484
Development of accelerated fuel-engines qualification procedures methodology, volume 1 [AD-A113461] N82-27317
Development of accelerated fuel-engines qualification procedures methodology. Volume 1: Appendices [AD-A113532] N82-27318
Evaluation of hydrocracking catalysts for conversion of whole shale oil into high yields of jet fuels [AD-A112820] N82-27523
SHELTERS
Cold regions testing of an air transportable shelter [AD-A107131] N82-27325
SHIPS
Lateral control system design for VTOL landing on a DD963 in high sea states [NASA-CR-169074] N82-26315
SHORT HAUL AIRCRAFT
Quiet Short-Haul Research Airplane (QSRA) model select panel functional description [NASA-TM-84243] N82-27319
SHORT TAKEOFF AIRCRAFT
STOL aircraft response to turbulence generated by a tall upwind building A82-35821
Advanced exhaust nozzle concepts using spanwise blowing for aerodynamic lift enhancement [AIAA PAPER 82-1132] A82-37692
Thrust reverser induced flow interference on tactical aircraft stability and control [AIAA PAPER 82-1133] A82-37693
Flight experiments using the front-side control technique during piloted approach and landing in a powered lift STOL aircraft [NASA-TM-81337] N82-26314
SHROUDS
Effect of impeller extended shrouds on centrifugal compressor performance as a function of specific speed [ASME PAPER 82-GT-228] A82-35411
SIDESLIP
Air data measurement using distributed processing and fiber optics data transmission N82-26214
SIGNAL ENCODING
A single-frequency multitransmitter telemetry technique A82-36281
SIGNAL GENERATORS
Real time pressure signal system for a rotary engine [NASA-CASE-LEW-13622-1] N82-26294
SIGNAL PROCESSING
Investigation of air transportation technology at Ohio University, 1981 --- loran N82-26204
SIGNAL TO NOISE RATIOS
Medium PRF performance analysis --- Pulse-Repetition Frequency A82-37378
Investigation of air transportation technology at Ohio University, 1981 --- loran N82-26204
SIMULATORS
Maintenance training simulator design and acquisition: Handbook of ISB procedures for design and documentation [AD-A111430] N82-26321
SLENDER WINGS
Chordwise and compressibility corrections for arbitrary planform slender wings A82-37931
SLIDING FRICTION
Geometrical aspects of the tribological properties of graphite fiber reinforced polyimide composites [ASLE PREPRINT 82-AM-5A-2] A82-37855
SLOPES
Design and implementation of efficient algorithms for automatic determination of corrected slant range [AD-A112248] N82-27267
SLOT ANTENNAS
Spiral slotted phased antenna array [NASA-CASE-MSC-18532-1] N82-27558
SMOKE
Fuel microemulsions for jet engine smoke reduction [ASME PAPER 82-GT-33] A82-35294
SMOKE ABATEMENT
An investigation of engine and test cell operating conditions on the effectiveness of smoke suppressant fuel additives [AD-A112800] N82-27527
SODIUM CHLORIDES
The effect of NaCl/g/ in high temperature oxidation [ASME PAPER 82-GT-106] A82-35342
SOLID PROPELLANT COMBUSTION
Combustion behavior of solid fuel Ramjets. Volume 2: Effects of fuel properties and fuel-air mixing on combustion efficiency [AD-A110796] N82-26303
Modeling solid-fuel Ramjet combustion including radiation heat transfer to the fuel surface [AD-A107441] N82-27436
SOLID PROPELLANTS
Combustion behavior of solid fuel Ramjets. Volume 2: Effects of fuel properties and fuel-air mixing on combustion efficiency [AD-A110796] N82-26303
SOOT
Evaluation of fuel injection configurations to control carbon and soot formation in small GT combustors [AIAA PAPER 82-1175] A82-35041

SOUNDING
The Hydrographic Airborne Laser Sounder (HALS) N82-26660
[AD-A111027]
SPACE ENVIRONMENT SIMULATION
Performance of the AEDC Mark 1 Aerospace
Environmental Chamber without oil diffusion
pumping N82-26322
[AD-A111406]
SPACE PERCEPTION
A laboratory evaluation of the suitability of a
xenon flashtube signal as an aid-to-navigation N82-26265
[AD-A110729]
Influence of contrast on spatial perception in TV
display of moving images N82-27609
[FB-50]
SPACE SIMULATORS
Performance of the AEDC Mark 1 Aerospace
Environmental Chamber without oil diffusion
pumping N82-26322
[AD-A111406]
SPACE TOOLS
The Marshall Space Flight Center KC-135 zero
gravity test program for FY 1981 N82-26350
[NASA-TM-82476]
SPACECRAFT ANTENNAS
Spiral slotted phased antenna array N82-27558
[NASA-CASE-MSC-18532-1]
SPANWISE BLOWING
Advanced exhaust nozzle concepts using spanwise
blowing for aerodynamic lift enhancement A82-37692
[AIAA PAPER 82-1132]
SPARE PARTS
The Sortie-Generation Model system. Volume 6:
Spares subsystem N82-26226
[AD-A110900]
SPARK IGNITION
A spark ignition model for liquid fuel sprays
applied to gas turbine engines A82-37220

SPATIAL FILTERING
Some potential novel approaches to the automatic
airborne detection and identification of ground
targets N82-27296

SPECTROMETERS
Evaluation of plasma source spectrometers for the
Air Force Oil Analysis Program N82-27512
[AD-A113809]
SPECTRUM ANALYSIS
Digital spectral analysis of the noise from short
duration impulsively started jets A82-36191

SPEED CONTROL
Yawing of wind turbines with blade cyclic-pitch
variation N82-26022
[DE81-029639]
SPILLING
The biological degradation of spilled jet fuels:
A literature review N82-26873
[AD-A110750]
SPIRAL ANTENNAS
Spiral slotted phased antenna array N82-27558
[NASA-CASE-MSC-18532-1]
SPOILERS
B-747 vortex alleviation flight tests:
Ground-based sensor measurements N82-27287
[AD-A113621]
SPRINGS (ELASTIC)
Assessment of the dynamic response of a structure
when modified by the addition of mass, stiffness
or dynamic absorbers A82-37790
[AHS PREPRINT 81-18]
SQUEEZE FILMS
Experimental evaluation of squeeze film supported
flexible rotors A82-35415
[ASME PAPER 82-GT-233]
Solution to a bistable vibration problem using a
plain, uncentralized squeeze film damper bearing A82-35455
[ASME PAPER 82-GT-281]
The effect of journal misalignment on the oil-film
forces generated in a squeeze-film damper A82-35457
[ASME PAPER 82-GT-285]
Engine dynamic analysis with general nonlinear
finite element codes. II - Bearing element
implementation, overall numerical
characteristics and benchmarking A82-35462
[ASME PAPER 82-GT-292]

STABILITY TESTS
Evaluating the effectiveness of hydrorefining of
the low-stability component of T-1 fuel A82-36673

STABILIZERS (FLUID DYNAMICS)
Investigation of an improved structural model for
damaged T-38 horizontal stabilizer flutter
analysis using NASTRAN N82-26316
[AD-A111095]
STAGGERING
Local heat transfer to staggered arrays of
impinging circular air jets A82-35401
[ASME PAPER 82-GT-211]
STAGNATION PRESSURE
The influence of flow rate on the wake in a
centrifugal impeller A82-35303
[ASME PAPER 82-GT-45]
STAINLESS STEELS
Geometrical aspects of the tribological properties
of graphite fiber reinforced polyimide composites A82-37855
[ASLE PREPRINT 82-AM-5A-2]
STANDARDIZATION
Opportunities exist to achieve greater
standardization of aircraft and helicopter seats N82-26259
[AD-A111718]
STATIC ELECTRICITY
Static charging and its effects on avionic systems A82-35732

STATIC FRICTION
Static charging and its effects on avionic systems A82-35732

STATIC LOADS
Static and aeroelastic optimization of aircraft A82-37945

STATIC PRESSURE
Investigation of the transonic calibration
characteristics of turbine static pressure probes A82-35454
[ASME PAPER 82-GT-280]
STATIC STABILITY
An analytical study of turbulence responses,
including horizontal tail loads, of a control
configured jet transport with relaxed static
stability N82-26313

STATISTICAL ANALYSIS
Assessment of aircraft
susceptibility/vulnerability to lightning and
development of lightning-protection design
criteria A82-35734

Rotor fragment protection program: Statistics on
aircraft gas turbine ngine rotor failures that
occurred in U.S. commercial aviation during 1978 N82-27316
[NASA-CR-165388]
STATOR BLADES
Laser anemometer measurements in an annular
cascade of core turbine vanes and comparison
with theory N82-26234
[NASA-TP-2018]
STATORS
Secondary flow effects and mixing of the wake
behind a turbine stator A82-35304
[ASME PAPER 82-GT-46]
Comparison of experimental and analytical
performance for contoured endwall stators N82-26299
[NASA-TM-82877]
STIFFNESS
Assessment of the dynamic response of a structure
when modified by the addition of mass, stiffness
or dynamic absorbers A82-37790
[AHS PREPRINT 81-18]
Torsional stiffness element based on
cobalt-samarium magnets --- for a turn and bank
indicator N82-27292
[BMFT-FB-W-81-048]
STRAKES
Hinged strake aircraft control system N82-26278

This supplement is available as NTISUB/141/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $5.00 domestic; $10.00 foreign.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 511 reports, journal articles, and other documents originally announced in October 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

to show the characteristics of the optimal trajectory, taking into account the optimal control features for guiding the aircraft along a particular trajectory. A description is presented of the general properties of optimal trajectories. These properties are used to solve any particular optimal trajectory which depends on the terminal conditions and the physical constraints. G.R.

A82-39399 † **Application of the sequential optimization method to the tuning of the natural frequencies of gas-turbine engine compressor blades (Primenenie metoda posledovatel'noi optimizatsii k ostroike chastot sobstvennykh kolebanii lopatok kompressora GTD).** A. B. Roitman, V. P. Afanas'ev, T. F. Mikhailova, and S. P. Omel'chenko. *Problemy Prochnosti,* July 1982, p. 86-89. 5 refs. In Russian.

The optimum tuning of the natural frequencies away from the dangerous resonance range is carried out for laterally oscillating turbine blades using the maximum blade profile thickness as the control function. The control range is limited by the tolerance on the blade geometry. A quality functional is obtained which provides a way to tune the natural frequencies with allowance for the constraints involved. V.L.

A82-39403 † **Problems in the simulation of correlation-extremal navigation systems (Problemy modelirovaniia korreliatsionno-ekstremal'nykh sistem navigatsii).** V. I. Alekseev and V. P. Tarasenko (Tomskii Institut Avtomatizirovannykh Sistem Upravleniia i Radioelektroniki, Tomsk, USSR). *Elektronnoe Modelirovanie,* vol. 4, July-Aug. 1982, p. 80-83. 9 refs. In Russian.

A general scheme for the simulation of correlation-extremal navigation systems is described, and problems of the synthesis and analysis of these systems which can be implemented through hybrid computers are examined. Applied programs developed for the simulation of correlation-extremal navigation systems are briefly characterized. B.J.

A82-39404 † **Simulation of correlation-extremal receivers of signals from sampling-phase radio-navigation systems (Modelirovanie korreliatsionno-ekstremal'nogo priemnika signalov impul'sno-fazovykh radionavigatsionnykh sistem).** I. M. Egorov and A. M. Korikov (Tomskii Gosudarstvennyi Universitet, Tomsk, USSR). *Elektronnoe Modelirovanie,* vol. 4, July-Aug. 1982, p. 84-89. 6 refs. In Russian.

The paper examines the simulation of correlation-extremal navigation systems according to radio fields created by sampling-phase radio-navigation systems. Particular attention is given to the simulation software, and the synthesis of a correlation-extremal receiver is considered for a Loran-C type system. B.J.

A82-39467 † **The use of analog computers in solutions of inverse problems of heat conduction for the identification of boundary conditions on the surfaces of gas-turbine-engine parts on the basis of temperature-measurement results (Ispol'zovanie AVM v resheniiakh obratnykh zadach teploprovodnosti dlia identifikatsii granichnykh uslovii na poverkhnostiakh detalei GTU po rezul'tatam ikh termometrirovaniia).** B. D. Bileka, V. N. Klimenko, and S. M. Chepaskina (Akademiia Nauk Ukrainskoi SSR, Institut Tekhnicheskoi Teplofiziki, Kiev, Ukrainian SSR). *Promyshlennaia Teplotekhnika,* vol. 4, July-Aug. 1982, p. 53-59. 5 refs. In Russian.

Methodological features and computational results are considered for two types of inverse problems of heat conduction: without heat removal in the inner zone and with heat removal. The first case is illustrated by the nonstationary problem of determining convective heat transfer from the gas to the stator above moving blades and to noncooled moving blades; while the second case is illustrated by the stationary problem of determining convective heat transfer from the gas to cooled nozzle blades. These two problems are treated by analog computation on the basis of the finite difference method; an implicit scheme using the Liebman method is applied to the nonstationary problem. Errors arising in the use of this approach to solve inverse heat-conduction problems are examined. B.J.

A82-39482 † **Turbulent boundary layer on a porous surface with injection at various angles to the wall (Turbulentnyi pogranichnyi sloi na poristykh poverkhnostiakh pri vduvakh pod raznymi uglami k stenke).** V. M. Eroshenko, A. A. Klimov, and L. S. Ianovskii. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza,* May-June 1982, p. 59-64. 13 refs. In Russian.

Experimental results are presented on turbulent boundary layers on porous plates in the case of uniform injection directed at various angles to the wall (15, 25, 40, 75, and 90 deg). The data disclose the influence of the intensity and angle of injection on the profiles of averaged and fluctuating velocities, characteristic thicknesses, surface friction, and turbulent shear stresses in the boundary layer. It is shown that moderate injections at angles to the flow are more effective in terms of protecting the surface than the commonly used normal-incidence injection. B.J.

A82-39539 **'Listening' systems to increase aircraft structural safety and reduce costs.** C. D. Bailey and W. M. Pless (Lockheed-Georgia Co., Marietta, GA). *Lockheed Horizons,* Summer 1982, p. 17-22.

Applications of acoustic emissions (AE) techniques to in-flight monitoring of fatigue stresses leading to parts failure is discussed. Due to inherent difficulties in designing all flows out of an aircraft, the deficiencies present in visual inspection, and the existence of many hard-to-reach critical areas, the use of AE for lifetime surveillance of potential fatigue-prone components of aircraft is offered as an effective means to prevent failure. Piezoelectric or capacitive devices are employed to detect AE originating from corrosion, stress-corrosion cracking, and crystal dislocation movements. The sensors are tuned to ranges outside of normal structural vibration and situated in areas known for potential flaws, sometimes in arrays which serve to locate a flaw through triangulation. Performance on board the KC-135 aircraft is cited as evidence for the cost-effectiveness of AE stress monitoring. M.S.K.

A82-39540 **The fourth dimension.** R. L. Heimbold and M. F. Leffler (Lockheed-California Co., Burbank, CA). *Lockheed Horizons,* Summer 1982, p. 24-30.

Problems and solutions for introduction of the Lockheed four-dimensional (4-D) flight management system (FMS) into regular airline traffic are explored. The 4-D system is operated totally by the flight management computer, which directs the plane to appropriate altitudes and speeds for minimum fuel consumption over the entire flight. The altitude is increased as fuel is consumed and the aircraft becomes lighter. Integration of the system into current air traffic involves including accurate wind data, initial estimates of arrival time and options for the flight path, a sufficient capacity for ATC control metering and spacing procedures, and accuracy of high enough order to reduce ATC workloads. Flow integration proceeds 100 mi from the airport and the necessity for a holding pattern results in a revectoring for approach once a go-around has been completed. It is noted that NWS forecasts are inadequate in terms of accuracy of available wind data. M.S.K.

A82-39718 **The technological aspects of titanium application in the TU-144 aircraft structure.** S. A. Vigdortchik and A. N. Tupolev. In: Titanium and titanium alloys: Scientific and technological aspects. Volume 3. (A82-39626 19-26) New York, Plenum Press, 1982, p. 2181-2193.

The development of techniques leading to the construction of significant portions of the TU-144 aircraft with titanium alloys is reviewed. Statistical data from experiments indicated that hydrogenation of the structural material and subsequent slow-rate failures could be controlled by vacuum low-temperature annealing, in addition to chemical milling combined with refining. The relationship of nitrogen and oxygen surface content introduced by heating, cutting, and multilayer welding to fatigue, slow-rate failure, and creep were also established statistically. Automatic inert-gas welding in sealed chambers was found to control the failure-producing elemental contents. Carbon contamination of surface layers was reduced by chemically etching and removing 0.2-0.5 mm of the surface. Finally, salt-stress corrosion was determined to be minimal in the expected operating temperatures of the titanium materials. M.S.K.

A82-39727 **Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers and Supplementary Papers.** Conference sponsored by the Royal Aeronautical Society and University of Bristol. Bristol, England, University of Bristol, 1982. Conference papers, 172 p; Supplementary papers, 57 p. (For individual items see A82-39728 to A82-39750)

Advances in system components, performance, and sensor systems of remotely piloted vehicles and unmanned vehicles are reported. The impacts and applications of RPVs on combat situations and costs are discussed, along with the various configurations of fixed wing and helicopter platforms, and Canadian, British, and U.S. efforts in RPV developmental programs. Attention is given to the various sensors which an RPV may carry, including radar, TV cameras, IR scanners, radiometers, and dead reckoning guidance systems. The design of algorithms for terrain following systems is described, as are sensor stabilization requirements and images received from remote sensors. Attention is given to the use of radio controlled aircraft in pollution studies, propulsion systems for RPVs, and image orientation for RPV ground station crew members. M.S.K.

A82-39728 # **Unmanned aircraft in future combat.** W. D. Simpson (British Aerospace Public, Ltd., Co., Dynamics Group, Stevenage, Herts., England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 2.1-2.5.

An assessment of the total effect of unmanned vehicles on armed forces is presented. The U.S. Army Aquila is noted to provide reconnaissance capability in a fixed wing aircraft form, while tethered helicopter platforms and drone dirigibles show promise of fulfilling the same needs at lower cost. Explosives delivery to targets at a distance have reached the level of cruise missiles, which are completely dependent on internal sensors and processors once launched. Similar autonomous vehicles, piston engined, can be used to jam radar, dispense chaff, and are called harassment drones. Production costs increase with the degree of sophistication of the system, including addition of IR sensors, jam-free radio, and personnel training required for control and retrieval. The autonomous systems are nominally used in large numbers and fly at high altitudes to retain line-of-sight communications. M.S.K.

A82-39729 # **Horses for courses in RPV operations.** R. G. Austin and C. J. Roberts (ML Aviation Co., Ltd., Bristol, England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 3.1-3.18.

Different configurations and capacities, the increase of cost with complexity, and examples of RPVs are examined. The highest cost savings engendered by use of RPVs is noted to be the stationing of the pilot in a relatively benign environment, while additional benefits are gained from civilian applications such as crop spraying and pollution monitoring, a smaller target in combat situations, and the reduction in support crew necessary for military applications. Although the range is generally limited to a quarter mile from the controller, repeated flights may be made for photographic purposes. Operation and components of a minimal system are described, and means of extending the range, addition of a TV camera, uses of helicopter-type vehicles, and retrieval by netting are reviewed. Attention is also given to equipping RPVs for flight in severe weather, reduction of noise, shielding the RPV IR emissions, and standards for the production of RPVs. M.S.K.

A82-39730 # **Short range tactical RPH system.** M. J. Breward (Westland Helicopters, Ltd., Yeovil, Somerset, England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 4.1-4.12. 5 refs.

Design features of a remotely piloted helicopter (RPH) for use in surveillance and as an observation post are discussed. The RPH is intended for use in the forward combat zone and needs high mobility, rapid deployment, flexibility of response, and rapid response. Performance requirements include all weather operation, 24-hr capability, a 10-km radius of action, a response time less than 10 min, and real time data flow. Attention is given to the sensor system with look-up ability, using low-light TV or IR scanner. The characteristics of the Wisp and Wideye RPHs are described, including payloads of 30 and 25 kg, respectively, and all up weights of 125 and 85 kg. Command links are achieved with low frequency transmissions lasting short periods, with 30-60 sec intervals of silence. Dead reckoning with meteorological input alone is recommended for overcoming the dangers of ECM. M.S.K.

A82-39731 # **Canadair rotary wing technology development.** A. S. Clark (Canadair, Ltd., Montreal, Canada). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 5.1-5.13.

Design, performance, and operational features of the Canadair CL-227 rotary wing RPV are detailed. The CL-227 is intended as a surveillance and target acquisition system transmitting in real time, operating in the short-to-medium range battlefield locations, and controlled by mobile units. A rotary winged configuration permits take-off from unprepared ground and hovering over target areas. The vehicle is modular in design, comprising power, rotor, and control units. A Wankel engine has been successfully employed during testing, and rotor blades are made of Kevlar with a foam core. The control module contains sensor and telemetry equipment for microwave relay and operation with four degrees of freedom. Attention is given to the development of a transfer function suitable for maintaining the aerodynamic stability of the vehicle. A total of 300 flights had been performed by 1980, and test procedures are described. M.S.K.

A82-39732 # **U.S. Army remotely piloted vehicle program.** J. K. Marstiller (U.S. Army, Aviation Research and Development Command, St. Louis, MO). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 6.1-6.5.

The U.S. Army full scale engineering development program for the Aquila RPV is described. Aquila is intended as an artillery aid to provide target acquisition, permit first round fire for effect, allow artillery adjustment, and provide designation for laser guided projectiles out to maximum artillery range. The entire system comprises the air vehicle, a ground control station, remote ground terminal, a hydraulic catapult launcher, a net type recovery subsystem, and support equipment. Aquila is launched 10-15 km on the friendly side of combat lines and flight is governed by preprogrammed internal commands covering waypoints, with loiter or jinking modes available by remote control, received in burst form. The vehicle carries a stabilized TV sensor with laser rangefinder/designator, and is constructed to survive in nuclear, ballistic, and chemical environments, and in worldwide climatic conditions. Operational testing is scheduled for 1982. M.S.K.

A82-39733 # **Stabileye.** R. Stephenson (British Aerospace Public, Ltd., Co., Dynamics Group, Bristol, England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 7.1-7.12. 6 refs.

Performance, design, and materials characteristics of the Stabileye RPV, which is used to define applications of RPVs, are detailed. The Stabileye has progressed through three versions, each featuring a twin-boom pusher engine layout, with the most recent, the MK.3, carrying a maximum payload of 25 kg, a 50 m/sec or less top speed, and flight duration of one hour. The MK.3 was constructed to examine the effectiveness of glass reinforced plastics and honeycomb core material for the fuselage, bulkheads, nose and rear body fairings, and the top lid, which conceals the payload and recovery parachute. The wing is a NACA 4415 profile made of hot-wire cut polystyrene foam with multiple hardwood spars and wood veneer/glass reinforced plastic skins. A two-cylinder, 7-hp power plant is interfaced with a pulse code modulated system. The primary sensor is a vertical gyroscope, with flight control electronics, a yaw rate gyro, and a telemetry encoder. M.S.K.

A82-39734 # **The national dynamics 'observer' mini-RPV for tropical operation.** M. Reed (Natal, University, Durban, Republic of South Africa). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 9.1-9.9. 7 refs.

Results of testing program of a mini-RPV for civil and military applications in South Africa are reported. The airframe was fabricated using epoxy resin/fiberglass and fire-retard low density styrofoam. A two-stroke engine was chosen, developing 22.6 hp at 7200 rpm and a four-bladed propeller for reasons of maintaining engine speed. Launch is from the roof of a car and power for servo-units is derived from nickel-cadmium battery packs. Program goals for additional development of a rhombic-wing mini-RPV are outlined. M.S.K.

A82-39735 # **MACHAN - A unmanned aircraft flight research facility.** T. G. Hamill (Marconi Avionics, Ltd., Rochester, Kent, England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 10.1-10.8. Research supported by the Ministry of Defence (Procurement Executive).

The purpose of this paper is to introduce the MACHAN programme, or to give it it's full name, 'the provision of an unmanned aircraft flight research facility'. This programme is funded by MOD(PE) with a substantial PV input from Marconi Avionics. The 3 aspects of the programme covered are the aircraft itself, the supporting facilities and, here, specifically the ground station, and the programme of experimental flying and payload trials as it is currently envisaged. (Author)

A82-39736 # **Mini-RPV propulsion.** L. A. Kolbo (Kolbo Corp., Anaheim, CA). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 13.1-13.4.

Mini-RPV propulsion systems which can deliver flight durations of four hours at speeds between 100 and 200 kn are reviewed. The reciprocating internal combustion engine is the favored choice because of fuel density, noise, heat signature, and fuel consumption characteristics. A two-cylinder configuration is the most satisfactory choice due to lightness, carburation, and simplicity. The engine components are preferably made of aluminum, chromium, and aluminum-magnesium alloys to preserve weight-saving design goals and heat-tolerant properties. It is recommended that mini-RPVs have a specific fuel consumption of 0.8, with an aneroid barometer-equipped carburetor in order to adjust fuel-air mixtures for height automatically. An ignition system which delivers 40,000 V open circuit is described, and features of propellers are discussed in terms of performance and material considerations. M.S.K.

A82-39737 # **The application of small propellers to RPV propulsion.** A. C. Roberts (British Aerospace Public, Ltd., Co., Dynamics Group, Bristol, England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 14.1-14.10.

Progress in the development of a data base for construction of propellers for increasing the range and performance of small unmanned aircraft is assessed. Compromises are necessary in design of propellers due to different requirements during climb and dash flight modes, and options for areas to explore include diameter and number of blades. Restrictions include resulting size of the radar target produced, the effect on forward looking sensors, recovery method, and noise. Small RPV propellers operate in the middle of the critical Reynolds number flow regime, encountering both laminar and turbulent flows while turning at 6000-8000 rpm. A numerical model is developed for optimizing propeller efficiency and a computer program is outlined for predicting performance. Wind tunnel tests of 0.5 m diam fixed-pitch 2-blade propellers showed that current predictions degrade in accuracy with increases in forward speed. M.S.K.

A82-39738 # **The control and guidance unit for MACHAN.** I. F. Cooper and J. A. Birkenshaw (Marconi Avionics, Ltd., Rochester, Kent, England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April

Current NASA research points toward exciting opportunities for large reductions in viscous drag. Research is underway on natural laminar flow, laminar flow control by suction, and turbulent drag reduction. Preliminary results suggest that a significant amount of natural laminar flow can be achieved on small, straight-wing airplanes. On larger, swept-wing aircraft, laminar flow control by distributed suction is expected to result in significant fuel savings. The area over which laminar flow control is applied depends on tradeoffs involving structural complexity, maintenance, and cost. Several methods of reducing turbulent skin friction by altering the turbulence structure itself have shown promise in exploratory testing. This paper reviews the status of these technologies and indicates the benefits of applying them to future aircraft. (Author)

A82-40897 # Viscous transonic airfoil flow simulation. J. Longo, W. Schmidt (Dornier GmbH, Friedrichshafen, West Germany), and A. Jameson (Dornier GmbH, Friedrichshafen, West Germany; Princeton, University, Princeton, NJ). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 214-223. 19 refs.

The present paper describes a method for the calculation of subsonic and transonic viscous flow over airfoils using the displacement surface concept. This modelling technique uses a fast multigrid solver for the full potential equation and laminar and turbulent boundary layer integral methods. In addition, special models for transition, laminar or turbulent separation bubbles and trailing edge treatment have been selected. However, the flow is limited to small parts of trailing edge-type separation. The present paper deals with some theoretical features in a short description and shows computed results compared with experimental data and other methods. (Author)

A82-40898 # Computation of supersonic flow around three-dimensional wings. B. G. Arlinger (Saab-Scania AB, Linkoping, Sweden). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 224-232. 16 refs.

As part of the development of a program for supersonic flow around realistic aircraft configurations a method is presented for the computation of strictly supersonic flow around single wings or two-wing configurations of arbitrary shape. The method is based on the steady Euler equations which are solved in a streamwise marching procedure using a shock-capturing finite volume formulation. As solution algorithm an explicit predictor-corrector scheme of MacCormack type is used. A variety of numerical applications of the method is presented including canard configuration cases, and comparisons are made with other theories and test data confirming versatility and reliability of the method. (Author)

A82-40899 # Transonic small disturbance code for body-wing configuration coupled with full potential code for wing alone. A. Luntz (Israel Aircraft Industries, Ltd., Lod, Israel). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 233-237. 7 refs.

A transonic small disturbance approximation code TSD was designed, for potential flow around a body-wing configuration. This code is based on the embedded fine grid concept elaborated by Ch. Boppe. Improvements are introduced into the boundary condition representation, including the body boundary condition, the wing boundary condition and the interface between the fine grid box and the coarse grid computation. Only cartesian coordinate grids are used. The code provides good prediction of the position of the shock on the wing surface, using a comparatively small number (about 20) of grid points along the wing section cord. The TSD code is coupled with a modified (no crossflow at the wing root plane) in FL022, is replaced with the crossflow values computed by the TSD code. This new boundary condition, at the wing root, contains all information of the body influence needed for the wing pressure computation. The coupling allows detailed analysis of the body-wing interference effects in the flow. (Author)

A82-40900 # Advanced fighter technology integration program AFTI/F-16. A. J. Bianco and F. R. Swortzel (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 238-246.

The AFTI/F-16 Advanced Development Program is developing and flight validating advanced technologies which improve fighter lethality and survivability. The capability is achieved by the integration of mission task-tailored, digital flight controls with a director-type fire control system, and advanced target sensor/-trackers. The Digital Flight Control System is the core technology. Integration of the systems forms the capability for automated maneuvering attack. Evaluation of automation, with respect to the weapon delivery task, is a key program thrust. Use is made of nonconventional aircraft control modes to achieve improved maneuverability and weapon line pointing. Careful attention is given to pilot/vehicle interface provisions. The AFTI/F-16 is now undergoing an extensive test program to provide the confidence necessary to transition the technologies for use on current and future fighter aircraft. (Author)

A82-40901 # Tail versus canard configuration - An aerodynamic comparison with regard to the suitability for future tactical combat aircraft. G. Wedekind (Dornier GmbH, Friedrichshafen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 247-254.

Extensive experimental and theoretical research work on tail and canard configurations has recently been done at Dornier, considering the requirements for a future tactical combat aircraft. Tail and canard configurations, which were designed for the same tactical requirements, are compared. This comparison leads to the conclusion that the canard configuration cannot be regarded superior to the tail configuration, neither with regard to zero-lift drag at supersonic speeds nor with regard to lift-dependent drag at subsonic and supersonic speeds. Furthermore, severe problems must be expected regarding lateral and directional stability at high angles-of-attack for a canard configuration. It turns out that those problems do not occur or are easier to handle with tail configurations. (Author)

A82-40902 # Material and process developments on the Boeing 767. J. T. Quinlivan and D. T. Lovell (Boeing Commercial Airplane Co., Seattle, WA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 255-261.

The design goal of the 767 is an economic service life of 20 years with minimum unscheduled maintenance. Materials, material processing, and assembly methods employed on the 767 play a key role in the achievement of this design goal. Materials and processes also are key in maintaining weight within design limits for fuel efficiency. The 767 uses a wealth of new and improved materials, processing methods, and assembly techniques. Some of the innovations are subtle and involve minor changes to previous technology, such as the reduction of certain fastener head diameters. Others are more dramatic, such as the use of new aluminum alloys for wing skins or advanced composites for primary flight-control surfaces. Corrosion resistance is achieved through material selection, attention to design details, and proper finishing and sealing methods. For the most part, the materials selected for the passenger cabin interior are new and are selected for their flame resistance and lack of smoke and toxicant emission during combustion. A review of major structural and nonstructural material and process developments on the 767 will be summarized in this paper. (Author)

A82-40903 # The promise of laminated metals in aircraft design. D. H. Petersen, L. E. Sloter, II, W. A. Poindexter, J. L. Maris, and G. E. Kuhn (Vought Corp., Dallas, TX). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 262-269. 8 refs.

The relative merits of monolithic metals, adhesively bonded sheet metal and a new family of metallurgically bonded laminated alloys are presented and discussed in light of the U.S. Air Force's laminated metal technology demonstration Advanced Technology Wing program. A wing section was designed and constructed whose lower skin consisted of adhesively bonded aluminum layers having no fastener penetrations. The elimination of lower wing skin fasteners precludes both corrosion intrusion sites and locations for structural cracking, and in addition reduces manufacturing and assembly costs. The wing suffered no damage during two lifetimes of spectrum fatigue testing, as well as an additional 1.8 lifetimes of damage tolerance testing which included exposure to sump water and JP-4 fuel. O.C.

A82-40904 # Design of compensated flutter suppression systems. M. Lanz and P. Mantegazza (Milano, Politecnico, Milan, Italy). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 270-279. 37 refs. Consiglio Nazionale delle Ricerche *Contract No. 81,02536,07.*

The paper presents a method to design compensated flutter suppression systems by eigenvalue assignment. The compensator is designed as a state observer by paralleling the Luenberger approach. The eigenvalues of the aeroelastic system and compensator are obtained by imposing a stationary value to a suitable norm of the gains, under the constraint of satisfying the aeroelastic eigensystem for assigned stable eigensolutions, and without any problem on the modelling of the unsteady aerodynamic forces. The compensator can be used not only to reconstruct lacking states, but also to insure insensitivity to different flight conditions. A method is presented to mechanize, and possibly to reduce in order, the aeroelastic observer. Some simple examples illustrate the use of the method along with comments on the stabilization of an aeroelastic system by eigenvalue assignment techniques. (Author)

A82-40905 # **Design and experience with a low-cost digital fly-by-wire system in the SAAB JA37 Viggen A/C.** K. Folkesson, P. O. Elgerona, and R. Haglund (Saab-Scania AB, Linkoping, Sweden). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 280-288. Research supported by the Forsvarets Materielverk.

A digital Fly-By-Wire system has been designed built and evaluated as a rig system and as a flight system installed in a JA37 Viggen test aircraft. Headlines for definition of the system have been low complexity and low production cost, met by trading off complexity against safety and reliability margins. System characteristics are minimized servo hardware, minimized channel interconnections and maximum replacement of hardware by software including servo loop closures. Functional development areas are application of optimal control technique for multimode laws and for servo loop computations. The paper will present system definition, system mechanization in test aircraft, ground test and flight test information. (Author)

A82-40906 * # **Design and flight testing of a digital optimal control general aviation autopilot.** J. R. Broussard (Information and Control Systems, Inc., Hampton, VA), D. R. Downing (Kansas, University, Lawrence, KS), and W. H. Bryant (NASA, Langley Research Center, Flight Control Systems Div., Hampton, VA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 289-298. 12 refs. Contract No. NAS1-16303.

This paper presents the designs of Proportional-Integral-Filter (PIF) autopilots for a General Aviation (NAVION) aircraft. The PIF autopilots use modern control theory to determine heading select and altitude select and hold autopilot modes. The PIF control law uses typical General Aviation sensors for state feedback; command error integration for command tracking; digital complimentary filtering and analog prefiltering for sensor noise suppression; a control filter for computation delay accommodation; and the incremental form to eliminate trim values in implementation. Theoretical developments for the control law are described which combine the sampled-data regulator with command generator tracking for use as a digital flight control system. The digital PIF autopilots are evaluated using closed-loop eigenvalues and simulations. Successful flight test results for the PIF autopilots are presented for different turbulence conditions and quadratic weights. (Author)

A82-40907 # **Preliminary design of an advanced integrated power and avionics information system.** G. L. Dunn, P. Leong (Boeing Military Airplane Co., Seattle, WA), and D. Fox (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 299-305. Contract No. F33615-80-C-2004.

An advanced aircraft electrical system is described which meets the requirements for a 1990 time frame two-engine tactical aircraft with multimission capability. It features modular design and use of intelligent electrical load management centers with solid state power controllers, resulting in a greatly enhanced aircraft electrical system over that currently available. The power generation and distribution, electrical power control, multiplex data bus characteristics, power system processor, electrical load management center, generator control unit, and electrical system software are discussed and diagrammed. C.D.

A82-40908 * # **Inlet and airframe compatibility for a V/STOL fighter/attack aircraft with top-mounted inlets.** D. A. Durston and D. B. Smeltzer (NASA, Ames Research Center, Moffett Field, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 305/a-305/i. 9 refs.

Aerodynamic force and inlet-pressure data were obtained for 9.5% force and pressure models of a V/STOL fighter/attack aircraft configuration with top-mounted twin inlets. Data are presented from wind tunnel tests conducted at Mach numbers of 0.6, 0.9, and 1.2 at angles of attack up to 27-deg and angles of sideslip up to 12-deg. Trimmed aerodynamic characteristics and inlet performance were compared for three different leading-edge extension (LEX) configurations. The effects of wing leading- and trailing-edge flaps on the inlet were also determined. Maneuver performance was calculated from combined force and inlet-pressure data. The largest of the three LEX sizes tested gave the best airplane maneuver performance. Wing flap deflections improved inlet recovery at all Mach numbers. (Author)

A82-40909 # **Investigation of the unsteady airloads on a transport aircraft type airfoil with two interchangeable oscillating trailing edge flaps, at transonic speed and high Reynolds numbers.** H. Triebstein (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Gottingen, West Germany), R. Destuynder (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France), and H. Hansen (Messerschmitt-Bölkow-Blohm GmbH, Hamburg, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 306-315. 8 refs. Research supported by the Bundesministerium für Forschung und Technologie.

Investigations in unsteady aerodynamics were conducted in order to study the potential of active control technology for transport aircraft wings. Wind tunnel tests were carried out using a large two-dimensional model with two interchangeable, fast moving, trailing edge control surfaces of different relative chord. The subsonic and supercritical pressure distributions were studied, and the unsteady aerodynamic coefficients were analyzed. It is found that in subsonic flow trailing edge separation causes considerable reduction in steady lift, but there is far less influence on the magnitude of the unsteady lift generated by an oscillating control surface. Only the corresponding phase angle changes dramatically. In transonic flow the development of the supersonic region and the shock strength and location demonstrate a predominant influence on steady as well as unsteady pressure distributions. The properties of the supersonic regions and the shocks change considerably with all parameters investigated. C.D.

A82-40910 # **Determination of the efficiency of a trailing edge flap in unsteady three-dimensional flow (Détermination de l'efficacité d'un volet de bord de fuite en écoulement tridimensionnel instationnaire).** H. Consigny (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 316-328. 18 refs. In French. Research supported by the Direction des Recherches, Etudes et Techniques and Ministère de la Défense.

A study was carried out in order to improve understanding of the three-dimensional unsteady effects of an oscillating part-span trailing-edge flap. The experiments were performed on a constant chord and constant thickness supercritical wing mounted on the sidewall of a transonic wind tunnel. The model was fitted with some 236 static pressure taps and 136 small unsteady pressure transducers located on several spanwise stations. The measurements made for different geometric configurations provided extensive information on the influence of various parameters on both steady and unsteady chordwise pressure distributions and aerodynamic coefficients. The experimental results were compared with those obtained by theoretical methods based on the solution of the full potential equation in steady flow and on the classical transonic small disturbances equation in unsteady flow. Quasi-steady pressure distributions were also compared to preliminary computational results, including viscous effects. C.D.

A82-40911 * # **An investigation of scale model testing of VTOL aircraft in hover.** W. G. Hill, Jr., R. C. Jenkins (Grumman Aerospace Corp., Bethpage, NY), and M. R. Dudley (NASA, Ames Research Center, Moffett Field, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 329-335. 6 refs. Contract No. NAS2-10645.

Utilizing the unique opportunity created by full scale hover testing of the twin-jet Grumman Design 698 VTOL aircraft in the NASA-Ames Hover Facility, a series of experiments was conducted to evaluate the effectiveness of scale model testing in predicting full scale behavior. Interference forces were found to be sensitive to aircraft lower surface geometry, but when the geometry was modeled accurately the small scale results matched full scale forces quite well. The interference forces were found to be insensitive to core nozzle temperature and fan nozzle pressure ratio. The results clearly demonstrate that small scale models can be reliably utilized for aircraft and technology development when the appropriate sensitivities are recognized. (Author)

ELECTRONIC/ELECTRIC TECHNOLOGY BENEFITS STUDY Report, Aug. 1980 - Jan. 1982
W. W. Howison and M. J. Cronin May 1982 226 p
(Contract NAS1-16199)
(NASA-CR-165890; NAS 1.26:165890; LR-30079) Avail: NTIS HC A11/MF A01 CSCL 01B

The benefits and payoffs of advanced electronic/electric technologies were investigated for three types of aircraft. The technologies, evaluated in each of the three airplanes, included advanced flight controls, advanced secondary power, advanced avionic complements, new cockpit displays, and advanced air traffic control techniques. For the advanced flight controls, the near term considered relaxed static stability (RSS) with mechanical backup. The far term considered an advanced fly by wire system for a longitudinally unstable airplane. In the case of the secondary power systems, trades were made in two steps: in the near term, engine bleed was eliminated; in the far term bleed air, air plus hydraulics were eliminated. Using three commercial aircraft, in the 150, 350, and 700 passenger range, the technology value and pay-offs were quantified, with emphasis on the fiscal benefits. Weight reductions deriving from fuel saving and other system improvements were identified and the weight savings were cycled for their impact on TOGW (takeoff gross weight) and upon the performance of the airframes/engines. Maintenance, reliability, and logistic support were the other criteria. Author

GENERAL AVIATION ACTIVITY AND AVIONICS SURVEY Annual Report
Judith C. Schwenk Dec. 1981 205 p refs
(AD-A112924; FAA-MS-81-5) Avail: NTIS HC A10/MF A01 CSCL 01/2

This report presents the results and a description of the 1980 General Aviation Activity and Avionics Survey. The survey was conducted during 1981 by the FAA to obtain information on the activity and avionics of the United States registered general aviation aircraft fleet, the dominant component of civil aviation in the U.S. The survey was based on statistically selected sample of about 14.0 percent of the general aviation fleet and obtained a response rate of 65 percent. Survey results are based upon responses but are expanded upward to represent the total population. Survey results revealed that during 1980 an estimated 41.0 million hours of flying time were logged by the 211,045 active general aviation aircraft in the U.S. fleet, yielding a mean annual flight time per aircraft of 190.5 hours. The active aircraft represented about 83 percent of the registered general aviation fleet. The report contains breakdowns of these and other statistics by manufacturer/model group, aircraft type, state and region of based aircraft, and primary use. Also included are fuel consumption, lifetime airframe hours, avionics, and engine hours estimates. Author (GRA)

AERODYNAMIC INTERACTIONS BETWEEN A 1/6 SCALE HELICOPTER ROTOR AND A BODY OF REVOLUTION
Mark D. Betzina and Patrick Shinoda Jun. 1982 15 p refs Prepared in cooperation with Army Research and Technology Labs., Moffett Field, Calif.
(NASA-TM-84247; A-8940; NAS 1.15:84247) Avail: NTIS HC A02/MF A01 CSCL 01A

A wind-tunnel investigation was conducted in which independent, steady state aerodynamic forces and moments were measured on a 2.24-m-diam. two bladed helicopter rotor and a body of revolution. The objective was to determine the interaction of the body on the rotor performance and the effect of the rotor on the body aerodynamics for variations in velocity, thrust, tip-path-plane angle of attack, body angle of attack, rotor/body position, and body nose geometry. Results show that a body of revolution near the rotor can produce significant favorable or unfavorable effects on rotor performance, depending on the operating condition. Body longitudinal aerodynamic characteristics are significantly modified by the presence of an operating rotor and hub. Author

The Applied Technology Laboratory conducted fatigue tests on a composite fan blade designed for use in the new NTF wind tunnel being constructed at NASA-Langley. The tests were performed by the Structures Technical Area using the root end fatigue machine (REFM), which was modified for ground-air-ground testing. Simulated centrifugal and aerodynamic (bending) load tests were performed. The fan blade successfully withstood 6000 cycles at 360 rpm and 600 rpm load conditions for the cyclic rate tests. These tests simulated the starting and stopping cycles of the fan. Static load tests to 57,000 pounds design load were also successfully performed on the blade specimen. Author (GRA)

Free flow and blown nacelle wind tunnel testing of engine airframe integration are compared, and the magnitude of the parasitic interference of an additional strut and engine inlet fairing

Benefits and costs expected to accrue from a terminal information display system (TIDS) are analyzed. TIDS is an electronic data processing system intended to replace (1) present flight data entry and printing equipment and (2) several devices currently used to display meteorological and operational information within towers and terminal radar control facilities. A description of the terminal information display system is presented. Major sources of both quantifiable and nonquantifiable benefits are discussed. It is shown that the installation of TIDS would improve terminal controller productivity by ten to fifteen percent and would result in a substantial reduction in maintenance costs. Information in present value (1981) dollars for the equipment life cycle is presented. Over the twenty year service life of TIDS, the analysis indicates that the benefit/cost ratio is 1.74 and the net present value of savings by installing TIDS at thirty major terminal facilities is about $26 million. HUMAN FACTORS IN AIR TRAFFIC CONTROL
V. David Hopkin (Royal Air Force Inst. of Aviation Medicine) Apr. 1982 187 p refs
(AGARD-AG-275; ISBN-92-835-1421-1) Avail: NTIS HC A09/MF A01

Human factors are related to air traffic control, air traffic control systems, the physical surroundings, equipment, and operation of the system, and the selection, development, training and evaluation of air traffic controllers. For individual titles, see N82-29294 through N82-29310.

N82-29294# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
THE AIR TRAFFIC CONTROL SYSTEM
In its Human Factors in Air Traffic Control Apr. 1982 p 3-9
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

Principles and practices of air traffic control are described. The information influencing the air traffic control system and the information available to the controller are summarized and defined. The users of air traffic control, whether commercial, military, or general aviation traffic is considered, are categorized, and their responsibilities discussed. Interactions between air traffic control and the pilot are considered. National and regional variations in the problems and practices of air traffic control are described. J.D.

N82-29295# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
HUMAN FACTORS CONTRIBUTIONS TO AIR TRAFFIC CONTROL SYSTEMS
In its Human Factors in Air Traffic Control Apr. 1982 p 10-21
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

The role of the human factors specialist in air traffic control systems operations and planning is analyzed. Man-machine interactions: the contribution of human factors engineering to system design, the implementation and testing of air traffic control systems and tasks, and the evolution of air traffic control systems; and the educational role of human factors specialists as applied to air traffic control are considered. J.D.

N82-29296# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
MAN AS A SYSTEM COMPONENT
In its Human Factors in Air Traffic Control Apr. 1982 p 22-30
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

The air traffic controller is considered as a component of a man-machine system. Limitations of this approach are considered. The allocation of functions, the effects of automation and computer assistance, the man-machine interface, and human reliability are discussed. J.D.

N82-29297# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
HUMAN CAPABILITIES AND LIMITATIONS IN SYSTEMS
In its Human Factors in Air Traffic Control Apr. 1982 p 31-46
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

Human capabilities and limitations which restrict the development of air traffic control systems are discussed. Sensory factors, perception, learning, memory, capacity for attention, information processing, understanding, problem solving, decision making, and motivation are considered. Common mismatches of system requirements with human capabilities are described. J.D.

N82-29298# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
JOBS AND TASKS IN AIR TRAFFIC CONTROL
In its Human Factors in Air Traffic Control Apr. 1982 p 47-52
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

Jobs and tasks are discussed. The required content of job descriptions and their application to allocation of jobs is considered. Task analysis and task synthesis, task grouping, interactions between tasks, and workloads are described. J.D.

N82-29299# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
THE WORK ENVIRONMENT
In its Human Factors in Air Traffic Control Apr. 1982 p 53-62
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

The work environment for all traffic control tasks is considered. Principles of workspace design are discussed. The physical environment, suites and consoles, air traffic control centers and control rooms, and air traffic control towers are described. J.D.

N82-29300# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
DISPLAYS
In its Human Factors in Air Traffic Control Apr. 1982 p 63-78
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

Factors affecting interactions between visual displays and their users are discussed. The physical dimensions of the display, the layout of the display and of information within the display, the information content of the display, visual codings and color codings, the legibility and readability of displays, the relation between displays, and the quality of displayed information are considered. New display technology is summarized. J.D.

N82-29301# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
CONTROLS
In its Human Factors in Air Traffic Control Apr. 1982 p 79-84
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

The location, type, sensitivity, and interactions of the controls used by the human to convey information to the air traffic control system are discussed. The relationships between controls and visual displays are considered. J.D.

N82-29302# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
COMMUNICATIONS
In its Human Factors in Air Traffic Control Apr. 1982 p 85-93
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

The human factor terms of communication in air traffic control are examined. The effects of known specified variables in communications on controller performance or system efficiency were measured. The importance of speech and the use of computers in the man machine systems as a means of dialogue and information transmission is emphasized. The following topics are discussed: transmission of information between air and ground; speech as a medium of communication; qualitative attributes of speech; automated speech recognition and automated speech synthesis; coordination and liaison; language and terminology of air traffic control; air traffic phrasing and message formats; information quantification and redundancy in air traffic control messages. E.A.K.

N82-29309# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).

ADDITIONAL FUNCTIONS WITHIN THE AIR TRAFFIC CONTROL SYSTEM

In its Human Factors in Air Traffic Control Apr. 1982 p 150-153
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

The application of human factors engineering to other job functions existing within the air traffic control system is discussed. Personnel involved in data gathering, maintenance of system integrity, fault finding, supervision, and traffic control assistance are considered. J.D.

N82-29310# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).

FUTURE TRENDS AND PROBLEMS

In its Human Factors in Air Traffic Control Apr. 1982 p 154-155
(For primary document see N82-29293 20-04)
Avail: NTIS HC A09/MF A01

Anticipated developments and problems occurring in the application of human factors engineering to air traffic control systems, particularly in the light of technological advances in hardware and software, are summarized. J.D.

ESTABLISHMENT OF A ROTOR MODEL BASIS

R. E. McFarland Jun. 1982 93 p refs Prepared in cooperation with Army Aviation Research and Development Command, Moffett Field, Calif.
(NASA-TP-2026; A-8605; NAS 1.60:2026;
AVRADCOM-TR-81-A-14) Avail: NTIS HC A05/MF A01 CSCL 01C

Radial-dimension computations in the RSRA's blade-element model are modified for both the acquisition of extensive baseline data and for real-time simulation use. The baseline data, which are for the evaluation of model changes, use very small increments and are of high quality. The modifications to the real-time simulation model are for accuracy improvement, especially when a minimal number of blade segments is required for real-time synchronization. An accurate technique for handling tip loss in discrete blade models is developed. The mathematical consistency and convergence properties of summation algorithms for blade forces and moments are examined and generalized integration coefficients are applied to equal-annuli midpoint spacing. Rotor conditions identified as 'constrained' and 'balanced' are used and the propagation of error is analyzed. Author

FLAP-LAG-TORSIONAL DYNAMICS OF EXTENSIONAL AND INEXTENSIONAL ROTOR BLADES IN HOVER AND IN FORWARD FLIGHT Semiannual Progress Report, Jan. - Jun. 1982

Crespo DaSilva Jun. 1982 72 p refs
(Grant NAG2-38)
(NASA-CR-169159; NAS 1.26:169159) Avail: NTIS HC A04/MF A01 CSCL 01C

The reduction of the O(cu epsilon) integro differential equations to ordinary differential equations using a set of orthogonal functions is described. Attention was focused on the hover flight condition. The set of Galerkin integrals that appear in the reduced equations was evaluated by making use of nonrotating beam modes. Although a large amount of computer time was needed to accomplish this task, the Galerkin integrals so evaluated were stored on tape on a permanent basis. Several of the coefficients were also obtained in closed form in order to check the accuracy of the numerical computations. The equilibrium solution to the set of 3n equations obtained was determined as the solution to a minimization problem. S.L.

THE FEASIBILITY OF A HIGH-ALTITUDE AIRCRAFT PLATFORM WITH CONSIDERATION OF TECHNOLOGICAL AND SOCIETAL CONSTRAINTS Thesis - Kansas Univ.

Ernald B. Graves Jun. 1982 250 p refs
(NASA-TM-84508; NAS 1.15:84508) Avail: NTIS HC A15/MF A01 CSCL 01C

The feasibility of remotely piloted aircraft performing year around missions at an altitude of 70,000 feet is determined. Blimp and airplane type vehicles employing solar-voltaic, microwave, or nuclear propulsion systems were considered. A payload weighing 100 pounds and requiring 1000 watts of continuous power was assumed for analysis purposes. Results indicate that a solar powered aircraft requires more solar cell area than is available on conventional aircraft configurations if designed for the short days and high wind speeds associated with the winter season. A conventionally shaped blimp that uses solar power appears feasible if maximum airspeed is limited to about 100 ft/s. No viable airplane configuration that uses solar power and designed to withstand the winter environment was found. Both a conventionally shaped blimp and airplane appear feasible using microwave power. Nuclear powered aircraft of these type are also feasible. Societal attitudes toward the use of solar power in high altitude aircraft appear favorable. The use of microwave power for this purpose is controversial, even though the ground station required would transmit power at levels comparable to existing satellite communications stations. S.L.

INVESTIGATION OF CORRELATION BETWEEN FULL-SCALE AND FIFTH-SCALE WIND TUNNEL TESTS OF A BELL HELICOPTER TEXTRON MODEL 222 Final Report

Patrick K. Squires Jun. 1982 401 p refs
(Contract NAS2-10773)
(NASA-CR-166362; NAS 1.26:166362) Avail: NTIS HC A18/MF A01 CSCL 01C

Reasons for lack of correlation between data from a fifth-scale wind tunnel test of the Bell Helicopter Textron Model 222 and a full-scale test of the model 222 prototype in the NASA Ames 40-by 80-foot tunnel were investigated. This investigation centered around a carefully designed fifth-scale wind tunnel test of an accurately contoured model of the Model 222 prototype mounted on a replica of the full-scale mounting system. The improvement in correlation for drag characteristics in pitch and yaw with the fifth-scale model mounted on the replica system is shown. Interference between the model and mounting system was identified as a significant effect and was concluded to be a primary cause of the lack of correlation in the earlier tests. Author

THE COST OF NOISE REDUCTION FOR DEPARTURE AND ARRIVAL OPERATIONS OF COMMERCIAL TILT ROTOR AIRCRAFT

Henry B. Faulkner and William M. Swan Jun. 1976 118 p refs
(Contract NAS2-7620)
(NASA-CR-137803; NAS 1.26:137803) Avail: NTIS HC A06/MF A01 CSCL 01C

The relationship between direct operating cost (DOC) and noise annoyance due to a departure and an arrival operation was developed for commercial tilt rotor aircraft. This was accomplished by generating a series of tilt rotor aircraft designs to meet various noise goals at minimum DOC. These vehicles ranged across the spectrum of possible noise levels from completely unconstrained to the quietest vehicles that could be designed within the study ground rules. Optimization parameters were varied to find the minimum DOC. This basic variation was then extended to different aircraft sizes and technology time frames. Author

AUTOMATED OPTIMUM DESIGN OF WING STRUCTURES. DETERMINISTIC AND PROBABILISTIC APPROACHES

S. S. Rao Aug. 1982 47 p refs
(NASA-TM-84475; L-15169; NAS 1.15:84475) Avail: NTIS HC A03/MF A01 CSCL 01C

The automated optimum design of airplane wing structures subjected to multiple behavior constraints is described. The structural mass of the wing is considered the objective function.

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. A82-38146 **Efficient optimum design of structures - Program DDDU.** L.-X. Qian, W. Zhong, Y. Sui, and J. Zhang (Dalian Institute of Technology, Dalian, People's Republic of China). *Computer Methods in Applied Mechanics and Engineering*, vol. 30, May 1982, p. 209-224. 12 refs.

An efficient optimization algorithm is developed for engineering structures subject to multiple constraints. This highly non-linear and implicit problem is reduced to a combination of a sequence of quasi-linear constraints and explicit problems of the statically determined structures. The method is based on the Kuhn-Tucker necessary conditions for optimality associated with a simple quadratic program designed simultaneously to determine the Lagrange multipliers and to delete non-active constraints. A number of examples including trusses and wing structures show that the method is efficient when compared with other competing techniques. (Author)

A82-38216 **Forward-swept wings add supersonic zip.** R. DeMeis. *High Technology*, vol. 2, Jan.-Feb. 1982, p. 33-40.

A forward-swept wing aircraft is being built under an Air Force contract for test flying in late 1983. This design has many advantages over conventional aft-swept wing aircraft, including a naturally smoother area distribution, which lowers wave drag and allows a wider fuselage at the center of gravity and, thus, provides greater payload and fuel capacity. However, since twisting of the wings caused by airflow produces extreme shearing forces, the forward-swept wing design has only recently become possible by means of structural tailoring of the wing using graphite-epoxy composite material which compensates for the unstable wing twisting under standard fighter-type flying conditions. In addition, the design confers such a responsive, unstable configuration that computer control is necessary to augment pilot action. Detailed explanations of the main aerodynamic features of the forward-swept wing design are given. N.B.

A82-38222 # **Composite use on helicopters.** J. Ray (United Technologies, Corp., Sikorsky Aircraft Div., Stratford, CT). *Astronautics and Aeronautics*, vol. 20, July-Aug. 1982, p. 60, 61.

Composite material used in components of the Sikorsky S-76 helicopter are reviewed. Composite fiber reinforced with Nomex and an aluminum honeycomb is employed for the horizontal stabilizer. The spar is equipped with caps made of unidirectional graphite-epoxy tape co-cured with Kevlar skin material. Two plies of woven Kevlar cover the caps in order to prevent galvanic corrosion. The inboard section of the spar possesses a precured torque tube of woven Kevlar cloth which is bonded to an aluminum core and provides the dominant load path for torsion and flexural shear. The composite materials are responsible for a 17.4% reduction in the airframe/gross weight ratio and an increase of 20% in the range due to the smooth flush contour of the stabilizer and consequent drag reduction. The fairings and doors of the S-76 are also made of laminated structures, and sandwich panels serve for the windshield support posts, internal frames, longitudinal elements and door jamb. M.S.K.

A82-38223 # **Toward all-composite helicopter fuselage.** L. Marchinski (Boeing Vertol Co., Philadelphia, PA). *Astronautics and Aeronautics*, vol. 20, July-Aug. 1982, p. 61, 62.

The construction and benefits of using all-composite material for helicopter fuselages, particularly on the Boeing Vertol 234, are outlined. The cabin floor of the 234 is made of four composite panels with fiber glass/Kevlar 49 face sheets and a Nomex honeycomb core. Molded-edge rubber seals bonded into the floor assembly durinn co-curing and machined 7050 aluminum fittings at each end of the lateral, Kevlar beams under the lower side of the floor panels have contributed to a vibration rate of less than 0.03 g. A 10% weight saving over that available with an all metal floor has been achieved, as well as greater impact resistance. The success with the floor indicates that replacement of all-metal fuselages with Nomex-honeycomb structures offers a potential weight savings of 33%. Further research is necessary into the effects of lightning strikes and electrical bonding. M.S.K.

A82-38224 # **Committing composites to the Boeing 767.** R. Hammer (Boeing Commercial Airplane Co., Renton, WA). *Astronautics and Aeronautics*, vol. 20, July-Aug. 1982, p. 62.

Applications of Kevlar/graphite composites in the Boeing 767 aircraft are reviewed, noting the higher weight savings which were achieved than were offered by metal or fiber glass/epoxy materials. Results from a NASA/Lockheed program testing the Kevlar composites in comparison with fiber glass parts proved the acceptability of using the Kevlar/graphite for 24 different aircraft components at a weight savings of over 2000 lb. It is concluded that the employment and techniques involving composite technologies are at the same stage as aluminum technology was in the 1930s. M.S.K.

A82-38249 **Mirage 2000 - Towards possible high series production aircraft (Mirage 2000 - Vers l'avion de série).** J. Morisset and N. Beauclair. *Air et Cosmos*, vol. 20, July 10, 1982, p. 26-42. In French.

Design and performance characteristics of the Mirage 2000 aircraft are presented, noting modifications available for different combat missions. The single-engined aircraft is equipped with multiple radar systems, can be used as an interceptor at high or low altitudes, is capable of carrying air-to-ground nuclear tipped missiles, and features two 30 mm cannons. Fly by wire control is standard, and, the aircraft is stable at high angles of attack with a top speed of Mach 2.2 while carrying a full load at 60,000 ft. The internal fuel stores are 3800 liters, and external stores can be added to extend the total range to 1500 km. By wind 1980 the Mirage 2000 had been flight tested in 1677 sorties, with tests being done on five configurations of the aircraft. Details of the design process, the use of composites in the aircraft structure, the operational features of the missile stores, the laser guidance system, and the electronics are provided. M.S.K.

A82-38261 # **Aerodynamic behavior of a slender slot in a wind tunnel wall.** D. B. Bliss (Princeton University, Princeton, NJ). *AIAA Journal*, vol. 20, Sept. 1982, p. 1244-1252. 8 refs. Grant No. AF-AFOSR-77-3337.

A theoretical model for the flow through a single slot of finite length in a wall separating a uniform freestream and a quiescent fluid at different static pressures is constructed. This problem is relevant to understanding the aerodynamic behavior of slots which are used in the test sections of some ventilated wall transonic wind tunnels. The theoretical relationship which is obtained between the pressure differential across the slot and the flow through the slot shows both the linear and quadratic regimes observed in experiments. The linear behavior arises from the acceleration of the cross flow into the slot downstream of the leading edge and from the interaction of streamwise stations along the slot, as well as from the effect of slot taper. Analytical solutions are obtained for two slot planform shapes, and some other cases are solved numerically. The quantitative agreement with experimental data is very encouraging. (Author)

A82-38293 # **Improved solutions to the Falkner-Skan boundary-layer equation.** C. A. Forbrich, Jr. (USAF, Armament Laboratory, Fort Walton Beach, FL). *AIAA Journal*, vol. 20, Sept. 1982, p. 1306, 1307. 11 refs. USAF-supported research.

The results of a state variable approach to computationally solve the Falkner-Skan equation over a wide range of boundary-layer acceleration parameters are presented. The Falkner-Skan equation is concerned with flow past an infinite wedge with a particular vertex angle, and solutions are presented which are accurate to eight places for third order differential equations. Iterative procedures for improving the order of accuracy are described, and an example is provided for the case of an initial wedge angle of 0.40 x pi. The method is considered acceptable for the analysis of slightly accelerating and decelerating flows encountered in low drag and supercritical airfoils. M.S.K.

A82-38405 **VHF radio link for ground-air-ground communications using an integrated voice-data modulation.** G. Benelli (Firenze, Università, Florence, Italy). *Electronics Letters*, vol. 18, June 24, 1982, p. 555, 556. Consiglio Nazionale delle Richerche *Contract No. 81,00,202.*

A possible realization of a data channel between aircraft and ground station is presented, which utilizes a combined amplitude-phase modulation. Amplitude modulation is used to transmit a voice signal, while phase modulation is used for

6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 16.1-16.11. Research supported by the Ministry of Defence (Procurement Executive).

Details of the MACHAN development program for evaluating the unmanned aircraft guidance achievable by a dead reckoning system aided by other systems and sensors are presented. An attitude and heading reference (AHRS) system was concluded to require a vertical reference within 0.5 deg and a heading reference of not more than 4 deg/hr, provide pitch, roll, and yaw rates for the autopilot, operate digitally, possess navigation capability and update, operate within various mission profiles, and be amenable to mass production. The AHRS system constructed featured three single axis gyros, three accelerometers, a dedicated real time microprocessor, and attitude recognition by reference to gravity and initial data. supplementary sensors, such as a single degree of freedom rate integrating gyro and accelerometer, pass data through the microprocessor where magnetic heading and Doppler velocity data are also considered. M.S.K.

A82-39739 # **U.S. Army remotely piloted vehicle supporting technology program.** T. D. Gossett (U.S. Army, Research and Technology Laboratory, Moffett Field, CA). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 18.1-18.10. 10 refs.

Details of the U.S. Army full scale engineering development program for the RPV Aquila are described. The system includes the air vehicle, a recovery system, an air vehicle handler, a remote ground terminal, a ground control station, a launcher subsystem, and a maintenance shelter. With attention focused on the propulsion and antijam data link developments, it is noted that the data link includes a command uplink, telemetry downlink, video downlink, and navigation of the air vehicle relative to the remote ground terminal. Components of the antijam modular integrated communication and navigation system comprise an analog null steerer, modems with chopped chirp waveforms, a direct pseudonoise spread modem, and a phased array. Ducted propellers were determined to offer higher takeoff, and quieter performance and efficiency than open propellers. Finally, operational features of the 20 hp test engines and the FLIR sensor are provided. M.S.K.

A82-39740 # **A terrain following system, an algorithm and a sensor.** E. Skarman (Saab-Scania AB, Linkoping, Sweden) and U. Rehammar (Telefonaktiebolaget L. M. Ericsson, Molndal, Sweden). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 19.1-19.15.

The development of a control logic for terrain following RPVs using radar and laser sensors to detect possible obstacles at least 1300 m in advance is described analytically. Limitations in the theory of linear dynamic systems are discussed in terms of filtering an input command with a low pass filter to avoid exceeding the mechanical environment stress limits of all vehicle subsystems. The odeling of a dynamic system comprises two states of the kinematics, vertical speed and altitude, the two states pitch of the vehicle dynamics, the flight control system, which is an acceleration feedback system, and the low pass filter. The system is shown to have one input and seven functions with simple asymptotes and control is confined to operating at height to height from time to time. Inputs to the command filter are developed along with decision rules, and two- and three-dimensional simulation algorithms are outlined. M.S.K.

A82-39741 # **Sensor stabilisation requirements of RPV's - A simulation study.** K. G. Narayanan, M. Madhuranath, S. K. Bhat, and G. Elangovan (Aeronautical Development Establishment, Bangalore, India). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 21.1-21.8. 6 refs.

The application of pilot simulator video displays to the development of sensors for the stabilization of TV carrying RPVs is described. Either films with servo-induced roll, yaw, and jitter or numerically generated images can be displayed to the RPV TV sensor. Particular attention is given to scaled geometric presentations which produce out-the-window views to pilots. Requirements for the simulation include accurate representations of objects, reflectance/radiance and contrast, RPV sensor accounting for resolution, sensitivity, FOV, look angle, slewing rate, image smear/lag, platform speed, direction, altitude, attitude, and maneuvers. The data link is limited by the range of operation, bandwidth, and noise, and terrains are chosen for the appropriate mission. Block diagrams are provided of the RPV sensor simulator and improvements necessary for the system to be operational. M.S.K.

A82-39742 # **Radars for UMA.** M. Scorer (Marconi Avionics, Ltd., Research Laboratory, Rochester, Kent, England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Conference Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 22.1-22.6.

The implementation of lightweight radar systems in unmanned aircraft (UMA) is discussed. Attention is given to the application of UMA to air defense as a passive receiver system, carrying radiometers as a passive detector, and microwave, millimeter wave, and laser radars for target detection and ranging. The necessity of developing laser radars which operate at eyesafe wavelengths, such as 10 micron CO2 lasers, which are currently too heavy for UMA, is noted. Data gathered by a UMA radar system is gained by means of a transmitter and a receiver, then relayed along a ground link. Millimeter wave radars permit the use of 20 cm antennas on UMAs while maintaining an image resolution of 25 m at 1.5 km, operating at 100 GHz. Flat plate printed circuit antennas several millimeters thick have been fabricated, permitting placement of the receiver on the same substrate as the antenna. Employing magnetrons for high power gain is outlined. M.S.K.

A82-39744 # **Electric propulsion for a mini RPV system.** G. R. Seemann and G. L. Harris (Developmental Sciences, Inc., City of Industry, CA). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Supplementary Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 12.1-12.6. Contract No. F33657-79-C-0508.

The advantages of electric propulsion, such as reliable instant-start, enhanced survivability, possible higher performance and improved storability, have merited further investigation. Advances in the development of the lithium battery have increased the payload performance to 200-300 Wh/lb with the battery being the prime factor of the propulsion system concept. A point design system of the mini-RPV is described based on predictions after a strawman mission, and studies of current and advanced concepts of an electric propulsion system are discussed in terms of the components of the system. Temperature control is studied, and performance estimates of the mini-RPV are outlined such as a speed range of 60-150 kts, a climb rate of 600 ft/min and an endurance of five hours. The system's potential use as an expendable vehicle to conduct surveillance, jamming or kamikaze missions is foreseen. R.K.R.

A82-39745 # **Flight control systems for aerial targets.** A. W. Bargery and K. W. Rosenberg (Marconi Avionics, Ltd., Rochester, England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Supplementary Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 17.1-17.18. Research supported by the Ministry of Defence (Procurement Executive).

Aerial targets, a class of unmanned aircraft (UMA), present constraints different from other classes of UMA. The control system design is partially determined by data link, tracking facilities, and range location. The flight control systems of two targets, the Jindivik, in operation for 25 years, and the Sea Vixen, soon to be in operation, are described. The Advanced Subsonic Aerial Target (ASAT) flight control system is under development, and its design approach, which anticipates a more expendable target vehicle, is described. The ground station for the ASAT requires a high initial investment, but the air vehicle requires a minimal cost. A comparison of each of these three systems is presented. The Jindivik has high operating skills, the Sea Vixen has medium skills, and the ASAT has low skills, while the Jindivik and the Sea Vixen require large crews and the ASAT requires a small crew. Block diagrams of each UMA are included. R.K.R.

A82-39746 **The design of a viewing system for near real time stereo images from a UMA borne linescan sensor.** J. A. C. Beattie (Royal Aircraft Establishment, Farnborough, Hants., England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Supplementary Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 20.1-20.3.

Laboratory trials demonstrate a display of stereoscopic images, received in data streams with a bandwidth of 512 kHz (-3 dB). The sensing and presentation of the data are described. An optical system consisting of a German television lens of 10.2 mm focal length and an F number of 1.8 is used. The image plane is divided in two by a right angle splitting prism with each half falling on a separate linear array angled 7.5 degrees from the optical axis. The two linear arrays provide data alternately, which is converted to form a pair of visible images. The demultiplexing system is explained, as well as various methods of storing the data. The effect of caroboarding is less severe with this system as it has an effective back drop. The viewing system is described with its main problem being that a 90 degree twist in the image path is necessary for correct viewing. The proposed air vehicle BAe (Filton) Stabileye MkII is discussed. In addition, it is shown that excessive movement may cause severe blurring, leading to difficulties in the fusion of the stereo pairs. Fifty lines of horizontal disparity and 12 lines of vertical disparity can be tolerated with a good stereo viewing facility. Two 4-bit images have been successfully stored and extracted using look up table methods. R.K.R.

A82-39747 # **Opto-electronical push-broom scanners for navigation, reconnaissance and generation of digital data bases.** O. Hofmann and P. M. W. Navé (Messerschmitt-Bolkow-Blohm GmbH, Munich, West Germany). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Supplementary Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 20A.1-20A.3.

A82-39750 # The design of a RPV ground station simulator. J. Ford and P. G. Thomasson (Cranfield Institute of Technology, Cranfield, Beds., England). In: Remotely piloted vehicles; International Conference, 2nd, Bristol, England, April 6-8, 1981, Supplementary Papers. (A82-39727 19-01) Bristol, England, University of Bristol, 1982, p. 26.1-26.7. Research supported by the Ministry of Defence (Procurement Executive).

A simulator complex has been designed representing the ground station environment of a remotely piloted vehicle (RPV) system, in order to evaluate the human factors of a ground control station such as the work load of the crew. The design requirements of the simulator are described, and the reasons for using a multicomputer design are explained. The primary requirement of the simulator is that it operate in real time, and a second requirement is that it be flexible in order to accommodate specification changes in the system. An example of the flexibility of the system is that the memory requirement of the system has increased from 24 K bytes to 128 K bytes with no need to modify the framework or computing capacity. The goals in creating a ground control station are that it be able to preplan missions for the RPV, to control and replan missions while the RPV is airborne, and to interpret real time imagery. Various diagrams are included. R.K.R.

A82-39836 # Aerodynamic aspects of aircraft dynamics at high angles of attack /AGARD Lecture/. K. J. Orlik-Ruckemann (National Aeronautical Establishment, Ottawa, Canada). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1363.* 22 p. 37 refs.

This paper presents a review of some of the fluid dynamics phenomena that are associated with the oscillatory flight at high angles of attack, with particular emphasis on asymmetric shedding of forebody vortices, asymmetric breakdown of leading edge vortices, the oscillatory motion of such vortices, and the time lag between the motion of the vortices and that of the aircraft. These phenomena cause a number of important effects on the dynamic stability parameters at high angles of attack (high alpha), such as strong nonlinearities with alpha, significant static and dynamic aerodynamic cross-coupling, large time-dependent and hysteresis effects, and a strong configuration dependence. The need to consider all the aerodynamic reactions in their vectorial form is emphasized, and the importance of the abovementioned effects on our prediction capabilities of aircraft behavior at high alpha is discussed. Development of adequate mathematical models is advocated and requirements for advanced wind tunnel techniques for performing the necessary oscillatory experiments are described. The oral presentation is illustrated by movie films showing flow visualization on oscillating models. (Author)

A82-39852 On the state of technology and trends in composite materials in the United States. J. R. Vinson (Delaware, University, Newark, DE). In: Composite materials: Mechanics, mechanical properties and fabrication; Proceedings of the Japan-U.S. Conference, Tokyo, Japan, January 12-14, 1981. (A82-39851 19-39) Barking, Essex, England, Applied Science Publishers, 1982, p. 353-361. 16 refs.

In connection with the ongoing NASA Aircraft Energy Efficiency Composite Primary Aircraft Program a number of composite material structural components have been installed on commercial aircraft and are in service today. The composite components involved include rudder, vertical fin, ailerons, elevators, and horizontal tail. Attention is given to the use of graphite composites in commercial and military aircraft, F100 afterburner nozzle flaps made of carbon-polyimide composite, the graphite-epoxy airframe of the Learfan 2100, the use of Kevlar in helicopters, the employment of Kevlar composites in sailplanes, the fabrication of the fifty foot long booms of the Space Shuttle from graphite epoxy, and the use of Kevlar-epoxy in the design of many rocket motor cases. Unfortunately, cost and confidence are still major obstacles toward more use of composites in the auto industry. G.R.

A82-39860 Tests of CFRP spar/rib models with corrugated web. Y. Tada, T. Ishikawa, and E. Nakai (National Aerospace Laboratory, Chofu, Tokyo, Japan). In: Composite materials: Mechanics, mechanical properties and fabrication; Proceedings of the Japan-U.S. Conference, Tokyo, Japan, January 12-14, 1981. (A82-39851 19-39) Barking, Essex, England, Applied Science Publishers, 1982, p. 461-470. 5 refs.

Static strength tests are conducted on cantilever beams with corrugated web, models of spars and ribs used in aircraft structures, which are fabricated from carbon fiber reinforced plastics. The shear strength of the corrugated web, the strain distributions, and the failure modes are evaluated for three types of models having different corrugation depths and laminate constructions. Results show that the ultimate strengths of the webs are approximately equivalent to the shear strength of flat specimens of the same laminate construction. In addition, the depth of the corrugation does not crucially change the strain distribution and the static bending strengths, but does effect the failure mode. Strengthened layers of the flange-web connections have little effect on the web strength. The critical state of the webs can be identified by observing the magnitude of the surface strains, not by the displacements. N.B.

A82-39862 Evaluation of CFRP prototype structures for aircraft. Y. Noritake, T. Kohda, Y. Abe, F. Yamauchi, S. Toyohira, K. Mogami, H. Arai, and N. Arata (Japan Defense Agency, Technical Research and Development Institute, Tachikawa, Tokyo, Japan). In: Composite materials: Mechanics, mechanical properties and fabrication; Proceedings of the Japan-U.S. Conference, Tokyo, Japan, January 12-14, 1981. (A82-39851 19-39) Barking, Essex, England, Applied Science Publishers, 1982, p. 478-486.

The results of flight test programs to test the suitability of CFRP advanced composites for aircraft structures are presented. The CFRP components tested included a rudder and rear nose landing gear door of a supersonic trainer, ground spoilers of a C-1 transport, and the outer leading edge slat rails of an antisubmarine patrol seaboat. Proof load tests were performed on the ground to affirm that the CFRP parts were as strong as conventional materials. The flight tests covered stresses from velocity, altitude, angle of attack, and load factor of the aircraft and stress on the composite components. Two and one-half years of flight data, with inspections every 200 hours and 9 months, were combined with coin tapping tests for external structural elements. No rigidity degradations were observed on the spoilers or the slat rails and all test components were evaluated as remaining in satisfactory condition. M.S.K.

A82-39863 Developments on graphite/epoxy T-2 nose landing gear door. K. Mogami, F. Yamauchi (Japan Defense Agency, Technical Research and Development Institute, Tachikawa, Tokyo, Japan), Y. Sakatani, and Y. Yamaguchi (Mitsubishi Heavy Industries, Ltd., Nagoya Aircraft Works, Nagoya, Japan). In: Composite materials: Mechanics, mechanical properties and fabrication; Proceedings of the Japan-U.S. Conference, Tokyo, Japan, January 12-14, 1981. (A82-39851 19-39) Barking, Essex, England, Applied Science Publishers, 1982, p. 487-493.

Attention is given to the material systems and processing specially developed for the graphite/epoxy composite door, among them unidirectional tapes, fabrics, chopped fiber materials, and semi-cocuring techniques. To evaluate the durability of the graphite/epoxy skin laminates, water absorption tests and fatigue tests are performed at low, high, and room temperatures for the design required. The all-graphite/epoxy beam-fittings were fabricated using the hot-pressing technique and tested to verify the bearing and bending strength according to design requirements. The saving in weight came to 25%. C.R.

A82-39864 Design, fabrication and qualification of the T-2 composite rudder. F. Yamauchi, K. Mogami (Japan Defense Agency, Technical Research and Development Institute, Tachikawa, Tokyo, Japan), T. Fukui, and T. Sato (Fuji Heavy Industries, Ltd., Aircraft Engineering Div., Utsunomiya, Tochigi, Japan). In: Composite materials: Mechanics, mechanical properties and fabrication; Proceedings of the Japan-U.S. Conference, Tokyo, Japan, January 12-14, 1981. (A82-39851 19-39) Barking, Essex, England, Applied Science Publishers, 1982, p. 494-503.

It is pointed out that this is the first primary control surface to be flight tested in Japan. The rudder has a span of 1.53 m, a 0.71-m chord at the midspan, and an area of 1.05 sq m. The design involves a single-spar, full depth honeycomb sandwich structure. Graphite/epoxy is used for the skins, spar, upper and lower closure ribs, and leading edge ribs. The graphite/epoxy parts make up approximately 40% of the total weight. The spar and closure ribs are precured and bonded to the sandwich assembly after the skins are cured. Nine precured leading edge ribs are attached with cherry-lock fasteners in addition to normal adhesive bonding. It is noted that a conservative design approach was used and that the primary objectives were to obtain actual production experience and in-service operational experience for a composite primary control surface. C.R.

A82-39865 Development of the advanced composite ground spoiler for C-1 medium transport aircraft. F. Yamauchi, K. Mogami (Japan Defence Agency, Technical Research and Development Institute, Tachikawa, Tokyo, Japan), H. Masaeda, and T. Shirata (Kawasaki Heavy Industries, Ltd., Aircraft Div., Kagamihara, Gifu, Japan). In: Composite materials: Mechanics, mechanical properties and fabrication; Proceedings of the Japan-U.S. Conference, Tokyo, Japan, January 12-14, 1981. (A82-39851 19-39) Barking, Essex, England, Applied Science Publishers, 1982, p. 504-512.

The research and development program for the graphite/epoxy ground spoiler for the C-1 medium transport aircraft is discussed. The design requirement was that the spoiler provide strength and rigidity not less than the baseline spoiler in addition to interchangeability. The design analysis was done by finite element method and the detail design configurations of major structural components were evaluated by trade-off tests in the initial design phase, showing that the components met design requirements. Successful environmental characteristic tests were also conducted. The scattering characteristic of the Gr/E for static and fatigue strength were obtained and found to be significantly superior to that of aluminum alloy. Full scale verification tests were also passed. C.D.

A82-39866 Fabrication of CFRP prototype structure for aircraft horizontal tail leading edge slat rail. F. Yamauchi, K. Mogami (Japan Defense Agency, Technical Research and Development Institute, Tochikawa, Tokyo, Japan), K. Suzuki, T. Kiho, and T. Ikuyama (Shin Meiwa Industry Co., Ltd., Kobe, sion for a heavy and inertial body. The solutions are compared both with bird flight and mechanical flight. C.D.

A82-40915 * # Advanced technologies applied to reduce the operating costs of small commuter transport aircraft. O. Masefield, A. Turi, and M. Reinicke (Pilatus Aircraft, Ltd., Stans, Switzerland). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 352-358. NASA-supported research.

The application of new aerodynamic, structural, and propulsion technologies to a specified baseline commuter aircraft is studied. The assessment models can be used on a desktop calculator and include a sizing program, operating cost program, and passenger ride qualities model. Evaluation is done with a step-by-step approach and is applied to range, number and type of engines, structure, wing selection, and configuration. A 40 percent direct operating cost saving is anticipated compared to current well established commuter aircraft. C.D.

A82-40917 # Design and experimental verification of the USB-flap structucture for NAL STOL aircraft. M. Sano (National Aerospace Laboratory, Tokyo, Japan), Y. Fujimori (National Space Development Agency, Tokyo, Japan), and S. Maekawa (Kawasaki, Heavy Industries, Ltd., Gifu, Japan). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 370-375. 6 refs.

In order to verify the safety of the USB flap structure of the NAL STOL experimental aircraft, tests were carried out on structural models, including a test to detect thermal buckling temperature, vibration tests, and an acoustic fatigue test at elevated and room temperature. The USB flap structure, the acoustic fatigue design, the structure and static and dynamic characteristics of the test panel are discussed, including the resonant frequency, mode shape and damping coefficient, static thermal response, and dynamic response. It was found that thermal buckling occurred on test panels, that resonant frequencies of the flat test panels fall in the range between those of clamped and those of simply supported plates, and that through the prescribed fatigue test period, all structural models proved themselves to be strong enough to resist both acoustic and thermal loading. C.D.

A82-40921 * # A summary of V/STOL inlet analysis methods. D. P. Hwang and J. M. Abbott (NASA, Lewis Research Center, Cleveland, OH). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 402-409. 24 refs.

The methods used to analyze the aerodynamic performance of V/STOL inlets at the NASA Lewis Research Center are briefly described. Recent extensions and applications of the method are emphasized. They include the specification of the Kutta condition for a slotted inlet, the calculation of suction and tangential blowing for boundary layer control, and the analysis of auxiliary inlet geometries. A comparison is made with experiment for the slotted inlet and also for tangential blowing. Finally, an optimum inlet diffuser velocity distribution is developed. (Author)

A82-40925 * # A unique flight test facility - Description and results. R. R. Meyer, Jr. (NASA, Flight Research Center, Edwards, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 433-448. 13 refs.

The Dryden Flight Research Facility has developed a unique research facility for conducting aerodynamic and fluid mechanics experiments in flight. A low aspect ratio fin, referred to as the flight test fixture (FTF), is mounted on the underside of the fuselage of an F-104G aircraft. The F-104/FTF facility is described, and the capabilities are discussed. The capabilities include (1) a large Mach number envelope (0.4 to 2.0), including the region through Mach 1.0; (2) the potential ability to test articles larger than those that can be tested in wind tunnels; (3) the large chord Reynolds number envelope (greater than 40 million); and (4) the ability to define small increments in friction drag between two test surfaces. Data are presented from experiments that demonstrate some of the capabilities of the FTF, including the shuttle thermal protection system airload tests, instrument development, and base drag studies. Proposed skin friction experiments and instrument evaluation studies are also discussed. (Author)

A82-40928 * # Determination of airplane aerodynamic parameters from flight data at high angles of attack. V. Klein (Joint Institute for Advancement of Flight Sciences, Hampton, VA) and J. G. Batterson (NASA, Langley Research Center, Hampton, VA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 467-474. 5 refs.

The problem of determining airplane aerodynamic model equations and estimating the associated parameters from flight data taken at high angles of attack is addressed. Two representations of the aerodynamic function based on the polynomial and spline representations are given. Then the technique of building an adequate model using a stepwise regression is presented with examples demonstrating the construction of the model and various approaches to model verification. (Author)

A82-40930 * # Computational and experimental studies of light twin aerodynamic interference. W. G. Thomson, W. H. Wentz, Jr., and C. Ostowari (Wichita State University, Wichita, KS). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 489-495. Research supported by the Beech Aircraft Co. and NASA.

The results of an analytical and experimental study of aerodynamic interference effects for a light twin aircraft are presented. Both the influence of a body (either fuselage or nacelle) on a wing and the influence of a wing on a body are studied. The wing studied uses a new natural laminar flow airfoil with variable camber movable trailing edge. A three-dimensional panel method program utilizing surface source and surface doublet singularities was used to design wing-nacelle and wing-fuselage fairings. Experiments were conducted using a 1/6 scale reflection plane model. Forces, pressures, and surface flow visualization results are presented. Results indicate that potential flow analysis is useful to guide the design of intersection fairings, but experimental tuning is still required. While the study specifically addressed a light twin aircraft, the methods are applicable to a wide variety of aircraft. (Author)

A82-40931 * # Dual wing, swept forward swept rearward wing, and single wing design optimization for high performance business airplanes. M. D. Rhodes and B. P. Selberg (Missouri-Rolla, University, Rolla, MO). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 496-511. 32 refs. Grant No. NAG1-26.

An investigation was performed to compare closely coupled dual wing and swept forward swept rearward wing aircraft to corresponding single wing 'baseline' designs to judge the advantages offered by aircraft designed with multiple wing systems. The optimum multiple wing geometry used on the multiple wing designs was determined in an analytic study which investigated the two- and three-dimensional aerodynamic behavior of a wide range of multiple wing configurations in order to find the wing geometry that created the minimum cruise drag. This analysis used a multi-element inviscid vortex panel program coupled to a momentum integral boundary layer analysis program to account for the aerodynamic coupling between the wings and to provide the two-dimensional aerodynamic data, which was then used as input for a three-dimensional vortex lattice program, which calculated the three-dimensional aerodynamic data. The low drag of the multiple wing configurations is due to a combination of two dimensional drag reductions, tailoring the three dimensional drag for the swept forward swept rearward design, and the structural advantages of the two wings that because of the structural connections permitted higher aspect ratios. (Author)

A82-40932 * # Assessment of advanced technologies for high performance single-engine business airplanes. D. L. Kohlman (Kohlman Aviation Corp., Lawrence, KS) and B. J. Holmes (NASA, Langley Research Center, Hampton, VA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 512-563. 24 refs.

The prospects for significantly increasing the fuel efficiency and mission capability of single engine business aircraft through the incorporation of advanced propulsion, aerodynamics and materials technologies are explored. It is found that turbine engines cannot match the fuel economy of the heavier rotary, diesel and advanced spark reciprocating engines. The rotary engine yields the lightest and smallest aircraft for a given mission requirement, and also offers greater simplicity and a multifuel capability. Great promise is also seen in the use of composite material primary structures in conjunction with laminar flow wing surfaces, a pusher propeller and conventional wing-tail configuration. This study was conducted with the General Aviation Synthesis Program, which can furnish the most accurate mission performance calculations yet obtained. O.C.

A82-40933 * # The design integration of wingtip devices for light general aviation aircraft. R. V. Gifford (NASA, Langley Research Center, Hampton, VA) and C. P. van Dam (Kansas, University, Lawrence, KS). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings.

Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 564-569. 21 refs.

An investigation was conducted to determine the load carrying capabilities and structural design requirements for wingtip devices on general aviation aircraft. Winglets were designed and analyzed as part of a research program involving a typical agricultural aircraft. This effort involved analytical load prediction for the winglets, structural design for both the winglets and aircraft installation, structural load testing and flight test verification. Conclusions from this program are believed to be applicable to the use of wingtip devices on light-weight general aviation aircraft. (Author)

A82-40934 # **Operation V10F - Development of a composite material wing.** G. Hellard (Société Nationale Industrielle Aérospatiale, Toulouse, France) and D. Chaumette (Avions Marcel Dassault - Breguet Aviation, Vaucresson, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 570-578.

The design development and detailed structural and fabrication method features of the Falcon 10 business jet aircraft carbon fiber reinforced plastic composite wing are described, with emphasis on the design and testing of individual wing structure components such as stiffened ribs and integrally stiffened upper and lower surface panels. The testing of laminate composite wing structure element properties included transverse loading, thermal and mechanical fatigue, shear, combined shear and bending, fuel pressure, tension, and compression. The delamination and lightning strike behavior of the wing components were also assessed. Finally, all structural elements were assembled and tested for static loads and fatigue. The composite wing represents a 20.3 percent weight saving over the metallic wing it replaces. O.C.

A82-40935 # **A one-shot autoclave manufacturing process for carbon epoxy components.** M. Kaltatzidis, R. Renz (Dornier GmbH, Friedrichshafen, West Germany), and D. Wurzel (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Stuttgart, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 579-585.

For the Alpha-Jet aircraft Dornier has developed and fabricated a carbon-/epoxy horizontal stabilizer, which has already successfully completed its qualification tests. This paper presents the requirements and goals of this development and describes the structural design of the horizontal stabilizer. For its leading and trailing edges a new one-shot manufacturing technique has been developed. The toolings are described, weight and cost savings are reported. This technique is now being applied for series production of ailerons for the Do 228 Commuter Aircraft. A brief presentation of the results of the qualification tests under various environmental conditions (humidity and temperature) is given. (Author)

A82-40936 # **Non-honeycomb F-16 horizontal stabilizer structural design.** D. N. Butcher (General Dynamics Corp., Fort Worth, TX). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 586-592.

A description is given of the F-16 fighter's horizontal stabilizer structural design and fabrication methods. The primary components of the stabilizer are graphite/epoxy composite skins, which are mechanically fastened with countersunk rivets to a one-piece sheet aluminum corrugated substructure and a machined aluminum pivot fitting. The skins and substructure are tooled to a common inside mold-line surface to facilitate assembly. Weight, construction and maintenance costs comparisons are made with the full depth-bonded honeycomb stabilizer design which the present one will replace. Despite a weight of 165.9 lb, by comparison to 157.8, the new stabilizer represents a 50% fabrication cost reduction at the 600th stabilizer produced. Lower maintenance costs are expected, in view of the long-term service problems associated with the honeycomb fabrication alternative. O.C.

A82-40937 # **Material identification for the design of composite rotary wings.** V. Giavotto, C. Caprile, M. De Capitani, L. Salvioni (Milano, Politecnico, Milan, Italy), V. Caramaschi, G. C. Maffioli, and F. Musai (Costruzioni Aeronautiche Giovanni Agusta S.p.A., Gallarate, Italy). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 593-606. 15 refs.

Among the developments that appear to be absolutely needed for the design of advanced composite rotary wings there are material models, to be supported by substantial experimentation and to be capable of an accurate modeling of the behavior of multilayer FRPs, complete of failure criteria regarding all possible failure modes. This paper reports an experimental activity carried on by Aerospace Department of Politecnico of Milano in cooperation with Costruzioni Aeronautiche G. Augusta. The most relevant part of such activity has been a fairly large campaign on tubular specimens in biaxial stress states and plane specimens in uniaxial stress states. All tests have been run statically, measuring stresses and strains up to failure. The results of such measurements have been so far worked out to verify existing material models and failure criteria. No one existing failure criteria seems to be completely adequate to the whole stress domain explored. (Author)

A82-40939 # **Dynamic energy transfer between wind and aircraft.** G. Schänzer (Braunschweig, Technische Universität, Brunswick, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-4087C 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 615-621. 6 refs.

The energy effect of vertical wind on glider aircraft is studied. The theoretical basis of maximum dynamic energy transfer is discussed, and the energy transfer problem is investigated using a glider with up and downdrafts varying in space. The response of the aircraft is calculated with a nonlinear simulation program on a digital computer. Maneuvering that produces optimal energy transfer is connected with a high kinetic energy level of the aircraft and high load factors which depend on vertical wind velocities. Energy-optimal flight maneuvers significantly increase the average groundspeed of a glider aircraft compared to the procedure described by Nickel and McCready (1949). C.D.

A82-40940 # **Digital computer simulation of modern aeronautical digital communication systems.** S. Chow (Nanjing Aeronautical Institute, Nanjing, People's Republic of China). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 622-629. 11 refs.

A Monte Carlo simulation method for modern aeronautical digital communication systems is described. Its relationship to various parameters is studied, including filtering, limiting, carrier frequency offset, bit time jitter, and multipath effects in A/G and A/A communications. (Author)

A82-40941 # **Flight simulation studies on the feasibility of laterally segmented approaches in an MLS environment.** L. J. J. Erkelens (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 630-641. 5 refs.

On the moving base flight simulator of the NLR an investigation was carried out to establish a number of minimum approach parameters concerning laterally segmented approach paths, assuming that guidance was provided by an MLS facility. Seven laterally segmented approach paths with different turn angles and final intercept altitudes were flown manually with a simulated heavy transport aircraft in the final approach configuration. Results were obtained in terms of tracking accuracy, pilot effort ratings and pilot responses to a questionnaire. A subsequent simulation program was carried out recently, in which as new items were introduced: a more realistic simulation of the MLS environment (MLS coverage area and signal noise), implementation of aircraft configuration changes (flaps, landing gear). A third simulation program is prepared in which the interaction is emphasized between the air traffic controller and the flight crew. The pilot is vectored to a point within MLS coverage, from which he is expected to intercept a laterally segmented approach path using MLS-guided intercept procedures. (Author)

A82-40942 # **A concept for 4D-guidance of transport aircraft in the TMA.** V. Adam and W. Lechner (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Brunswick, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 642-653. 18 refs.

The four dimensional (4D) guidance of aircraft in the TMA allows for precise control of the minimum separation and thus efficient use of the available approach capacity of the airport. A concept for the 4D-guidance of transport aircraft has been developed and a corresponding control mode has been integrated in an automatic flight control system for transport aircraft. The 4D mode is based on the usual radar vector guidance technique of air traffic control and, therefore, is characterized by a succession of flight sections with constant values for indicated airspeed, heading and descent rate. The time of arrival is controlled by altering the path via a delay fan. The algorithm for the calculation of the commanded 4D flight path takes into account suitable wind models updated by actual wind data. In the paper the 4D mode is described and first flight test results are discussed. (Author) is examined. A semispan model, typical of a transport aircraft with a supercritical wing was tested. A 3/4 fan cowl high bypass engine was located at six positions underneath the wing. Measurements included pressure and balance force. It is shown that while accurate simulation of engine nozzle geometry is of prime importance, tests on free flow nacelles are useful for selecting engine position. Interference forces derived from pressure integration are only useful for determining trends in interference effects for flexible initial tests. Author (ESA)

A FINITE DIFFERENCE METHOD FOR THE CALCULATION OF TRANSONIC FLOW ABOUT A WING, BASED ON SMALL PERTURBATION THEORY
J. vanderVooren, G. H. Huizing, and A. vanEssen 5 Mar. 1981 103 p refs
(Contract NIVR-1739)
(NLR-TR-81031-U) Avail: NTIS HC A06/MF A01

A calculation method for the transonic flow about a semiwing based on transonic small perturbation theory, is presented. The influence of a body can be simulated by prescribing appropriate transverse velocities in a vertical plane through the wing root. The wing should be thin and have little dihedral, camber, and twist and a not too blunt leading edge. The body should be slender. The angle of incidence must be small. However, highly swept wings are allowed. A fully finite difference scheme is implemented for a correct shock capture. Line relaxation is used to solve the corresponding nonlinear equations. It is indicated that too much artificial viscosity leads to an unrepresentative calculation, and too little can lead to instabilities. Author (ESA)

A STUDY OF WIND SHEAR EFFECTS ON AIRCRAFT OPERATIONS AND SAFETY IN AUSTRALIA
K. W. Anderson and B. A. J. Clark Mar. 1981 84 p refs
(ARL-Sys-Rept-24; AR-002-271) Avail: NTIS HC A05/MF A01

The ergonomics aspects of aircraft operation in conditions of local variations of wind were studied. Questionnaires were analyzed for subject understanding, detection of wind difficulties, frequency of wind shear and downdraft situations, pilot techniques, and forewarning methods. Pilots often found terrain-induced downdrafts and thunderstorm wind shears troublesome. Operations in irregular terrain away from major aerodromes were frequently cited for wind shear hazards. Pilot judgements on the most susceptible aircraft types were not readily explicable in terms of size, landing speed or wing loading. Pilots and ATCs indicated that currently used cues in wind shear conditions include visual estimates of glideslope departures, precision approach radar observations and aircraft-based measurements of wind or ground speed. Ground-based remote sensing equipment for detecting stable wind shear is considered. A synopsis of wind-involved airliner crashes and a summary of meteorological conditions for the occurrence of local wind variations are included. Author

GUST RESPONSE OF COMMERCIAL JET AIRCRAFT INCLUDING EFFECTS OF AUTOPILOT OPERATION Final Report
Joseph H. Goldberg Jun. 1982 125 p refs
(Contract NAS1-16095)
(NASA-CR-165919) Avail: NTIS HC A06/MF A01 CSCL 01C

A simplified theory of aircraft vertical acceleration gust response based on a model including pitch, vertical displacement and control motions due to autopilot operation is presented. High-order autopilot transfer functions are utilized for improved accuracy in the determination of the overall response characteristics. Four representative commercial jet aircraft were studied over a wide range of operating conditions and comparisons of individual responses are given. It is shown that autopilot operation relative to the controls fixed case causes response attenuation of from 10 percent to approximately 25 percent depending on flight condition and increases in crossing number up to 30 percent, with variations between aircraft of from 5 percent to 10 percent, in general, reflecting the differences in autopilot design. A detailed computer program description and listing of the calculation procedure suitable for the general application of the theory to any airplane autopilot combination is also included. Author

COMPARATIVE VERTICAL IMPACT TESTING OF THE F/FB-111 CREW RESTRAINT SYSTEM AND A PROPOSED MODIFICATION
Bernard F. Hearon, James W. Brinkley, James H. Raddin, Jr., Lawrence A. McGowan, and Joseph M. Powers Mar. 1982 312 p refs
(AF Proj. 7231)
(AD-A113957; AFAMRL-TR-82-13) Avail: NTIS HC A13/MF A01 CSCL 01/3

An impact test program was conducted to evaluate the operational F/FB-111 crew seat and restraint system and a proposed modification. A primary objective of the program was to compare human response to vertical impacts in the two restraint harnessess. A total of 67 human impact tests were performed on the Vertical Deceleration Tower up to 10 G peak, 26 ft/sec. Subjects were exposed to comparable impacts at different seat elevations in both harnesses to allow parametric analysis of the test results. Measured data included seat acceleration and velocity, head and chest translational acceleration components, triaxial forces acting on the seat and footrest, forces acting at the restraint harness, attachment, and deplacements of various body segments. The resultant head and chest accelerations were significantly greater in the modified harness than in the operational harness, regardless of seat elevation. On the basis of this comparison, the proposed modification to the F/FB-111 crew seat and restraint is not recommended for implementation. Future restraint harness modification proposals should be based on careful evaluation of all unconventional design features of the operational harness and should address all mechanisms by which adverse loads may be imposed on the seat occupant. In addition, future redesign efforts of the F/FB-111 escape system should provide improved landing impact attenuation. GRA

SMOKE ABATEMENT SYSTEM FOR CRASH RESCUE/FIRE TRAINING FACILITIES Final Report, Sep. 1979 - Sep. 1981
Anthony J. Kwan and John A. Hamre Sep. 1981 33 p
(AF Proj. 2505)
(AD-A114380; AFESC/ESL-TR-81-43) Avail: NTIS HC A03/MF A01 CSCL 13/2

This report provides the design for a smoke-abated aircraft crash/rescue trainer. The design is for a 75-ft diameter fire area suitable for operation in freezing and nonfreezing climates. With this system liquid petroleum fuels can be burned with little or no smoke by injecting a fine water spray near the surface of the burning fuel. This method of smoke abatement is being applied at military fire fighting training facilities. The report includes all equipment necessary for the smoke abatement function and provides detailed step-by-step operating procedures. Author (GRA)

(NASA-CR-3574-Pt-4; NAS 1.26:3574; AMA-81-37) Avail: NTIS HC A03/MF A01 CSCL 17G

The necessary algorithms to reconstruct the glideslope change waypoint along a straight line in the event the aircraft encounters a valid MLS update and transition in the terminal approach area are presented. Results of a simulation of the Langley B737 aircraft utilizing these algorithms are presented. The method is shown to reconstruct the necessary flight path during MLS transition resulting in zero cross track error, zero track angle error, and zero altitude error, thus requiring minimal aircraft response. IMPROVED 243 MHz HOMING ANTENNA SYSTEM FOR USE ON HELICOPTERS

F. Klinker 23 Apr. 1981 24 p refs Presented at Intern. IEEE/AP-s Symp., Los Angeles, 16-19 Jun. 1981
(NLR-MP-81022-U) Avail: NTIS HC A02/MF A01

The principles of azimuthal homing systems used in SAR search and rescue helicopters are outlined. In current SAR systems the homing signal is represented by the intersection of the radiation from two vertical dipoles. Intersections at 0 and 180 deg with respect to a center line are desired, but those at 120, 140, and 200 deg must be eliminated. Pattern distortion, which results in spurious intersections, is caused by mutual coupling between antennas, electromagnetic interaction coupling through the beam forming network, and attenuation and reflection of the received signal by the helicopter fuselage. The design uses reflectors on the antennas to reduce fuselage influence, and increases separation between radiation patterns to prevent intersections arising from mutual coupling. No homing ambiguities are reported in flight tests of a helicopter using the redesigned system. Author (ESA)

SPECIAL INVESTIGATION REPORT: AIR TRAFFIC CONTROL SYSTEM

8 Dec. 1981 60 p
(PB82-136276; NTSB-SIR-81-7) Avail: NTIS HC A04/MF A01 CSCL 05A

The air traffic control system was investigated following a strike of the air traffic controllers which resulted in the walkout of about 11,400 of the 17,275 controller workforce. The investigation included an analysis of ATC data, the ability of the FAA to meet staffing requirements, the qualifications of the controller workforce, training for new controllers, the effect of stress and fatigue, facility supervision and management, the control of the capacity of the system, and computer and equipment reliability. No basic ATC procedures were changed or compromised in order to keep the ATC system in operation, and the high level of ATC safety required is possible within the present system. GRA

MEANS FOR CONTROLLING AERODYNAMICALLY INDUCED TWIST Patent

Wolf Elber, inventor (to NASA) Issued 18 May 1982 4 p Filed 28 Sep. 1979 Supersedes N80-16055 (18 - 07, p 0821)
(NASA-Case-LAR-12178-1; US-Patent-4,330,100; US-Patent-Appl-SN-079913; US-Patent-Class-244-48) Avail: US Patent and Trademark Office CSCL 01C

A control mechanism which provides active compensation for aerodynamically induced twist deformation of high aspect ratio wings consists of a torque tube, internal to each wing and rigidly attached near the tip of each wing, which is moved by an actuator located in the aircraft fuselage. As changes in the aerodynamic loads on the wings occur the torque tube is rotated to compensate for the induced wing twist.

DESIGN CONSIDERATIONS AND EXPERIENCES IN THE USE OF COMPOSITE MATERIAL FOR AN AEROELASTIC RESEARCH WING

Clinton V. Eckstrom and Charles V. Spain (Kentron International, Inc., Hampton, Va.) May 1982 11 p refs Presented at 23rd AIAA/ASME/ASCH/AHS Structures, Structural Dyn. and Mater. Conf., New Orleans, 10-12 May 1982
(NASA-TM-83291; NAS 1.15:83291; AIAA-82-0678) Avail: NTIS HC A02/MF A01 CSCL 01C

Experiences in using composite skin material on an aeroelastic research wing used in flight flutter testing are described. Significant variations in skin shear modulus due to stress and temperature were encountered with the original fiberglass laminate skin designed to minimize wing torsional stiffness. These variations along with the sensitivity of wing torsional stiffness to the skin-to-frame attachment method complicated the structural model vibration mode predictions. A wing skin redesign with different fiber orientation and a reduction in the amount of skin-to-frame bonding resulted in more predictable model characteristics without sacrificing design objectives. Design and modeling considerations for future applications are discussed. Author

A comprehensive analytical design procedure for the installa-

The maximum stress, wing tip deflection, root angle of attack, and flutter velocity during the pull up maneuver (static load), the natural frequencies of the wing structure, and the stresses induced in the wing structure due to landing and gust loads are suitably constrained. Both deterministic and probabilistic approaches are used for finding the stresses induced in the airplane wing structure due to landing and gust loads. A wing design is represented by a uniform beam with a cross section in the form of a hollow symmetric double wedge. The airfoil thickness and chord length are the design variables, and a graphical procedure is used to find the optimum solutions. A supersonic wing design is represented by finite elements. The thicknesses of the skin and the web and the cross sectional areas of the flanges are the design variables, and nonlinear programming techniques are used to find the optimum solution. S.L.

HEADS UP DISPLAY Patent Application
H. Douglas Garner and William E. Howell, inventors (to NASA)
Filed 28 May 1982 12 p
(NASA-Case-LAR-12630-1; US-Patent-Appl-SN-383384) Avail: NTIS HC A02/MF A01 CSCL 01D

A heads up aircraft display which allows the pilot to view the display without diverting his attention from the scene ahead is disclosed. The display is designed for use on propeller driven aircraft comprised of a radially disposed row of lamps embedded in the rear surface of a propeller. Measurements of flight data are made by conventional means and converted into digital signals. These digital signals are applied to graphic generators which control lamp drivers which in turn control lamps through slip rings. The lamps are lit at the appropriate times during each revolution of the propeller to display the flight data in graphic form to the pilot. The combination of graphic generators and radially disposed lamps embedded in an aircraft propeller enables the pilot to view the display without diverting his attention from the scene ahead. NASA

COOLED VARIABLE NOZZLE RADIAL TURBINE FOR ROTOR CRAFT APPLICATIONS
C. Rogo Mar. 1981 205 p refs
(Contract NAS3-22005; DA Proj. 1L1-62209-AH-76)
(NASA-CR-165397; NAS 1.26:165397; Rept-1759) Avail: NTIS HC A10/MF A01 CSCL 21E

An advanced, small 2.27 kb/sec (5 lbs/sec), high temperature, variable area radial turbine was studied for a rotor craft application. Variable capacity cycles including single-shaft and free-turbine engine configurations were analyzed to define an optimum engine design configuration. Parametric optimizations were made on cooled and uncooled rotor configurations. A detailed structural and heat transfer analysis was conducted to provide a 4000-hour life HP turbine with material properties of the 1988 time frame. A pivoted vane and a moveable sidewall geometry were analyzed. Cooling and variable geometry penalties were included in the cycle analysis. A variable geometry free-turbine engine configuration with a design 1477 K (2200 F) inlet temperature and a compressor pressure ratio of 16 1 was selected. An uncooled HP radial turbine rotor with a moveable sidewall nozzle showed the highest performance potential for a time weighted duty cycle. Author

MULTISTAGE AXIAL COMPRESSOR PROGRAM ON TIP CLEARANCE EFFECTS Contractor Report, May 1979 - Aug. 1981
I. Moyle Aug. 1981 49 p refs
(Contract N62271-80-M-2504)
(AD-A107445; NPS67-81-01CR) Avail: NTIS
HC A03/MF A01 CSCL 21/5

Tip clearance has long been known to be a source of losses in axial compressors with cantilevered blades. The reasons for the losses, however, are not well understood and current practice in engine design still requires extensive effort to maintain constant minimal operating clearances over a wide range of conditions. The emphasis on clearance control may be appreciated by the typical observation that a ten percent change in peak static pressure rise in a compressor stage may occur for a fifty percent change in clearance. Clearances are typically in the one to five percent of major passage dimension range, and thus a small change in passage dimensions represents a large change in clearance. It is clear that, in general, it would be desirable that blading performance be less sensitive to changes in clearance. Less sensitivity would allow a general relaxation of the mechanical tolerances on a compressor assembly and provide more consistent transient performance. The aerodynamics of achieving such a situation are a challenge as the underlying requirement is improved performance at larger clearances. Work toward understanding the basic mechanisms of tip clearance effects with an emphasis on designing for clearance has been commenced at the Naval Postgraduate School Turbopropulsion Laboratory (NPS/TPL). This report summarizes the preliminary work on the Multistage Compressor (MSC) facility at the Laboratory. GRA

WATER INGESTION INTO AXIAL FLOW COMPRESSORS. PART 3: EXPERIMENTAL RESULTS AND DISCUSSION Final Report, 15 Dec. 1977 - 30 Jun. 1981
T. Tsuchiya, S. N. B. Murthy, C. M. Ehresman, and D. Richards Wright-Patterson AFB, Ohio AFWAL Oct. 1981 268 p refs
(Contract F33615-78-C-2401; AF Proj. 3066)
(AD-A114830; AFWAL-TR-80-2090-Pt-3) Avail: NTIS HC A13/MF A01 CSCL 21/5

The subject of air-water mixture flow in axial compressors of jet engines is of practical interest in two contexts of water ingestion: during take-off from rough runways with puddles of water and during flight through rain storms. The change in the compressor performance in turn produces changes in the performance of other components and of the engine as a whole. During the current investigation, (1) an analysis of the effects of water ingestion into a compressor has been carried out leading to the development of a predictive code, the PURDU-WICSTK program and (2) a series of tests have been carried out on a small test compressor with mixtures of gases (containing methane gas to simulate steam) and with air-water droplet mixtures. The experimental results have been compared with predictions. It is concluded that the basic effects of water ingestion into compressors arise through (1) blockage, (2) distortion and (3) heat and mass transfer processes, the changes in blade aerodynamic performance being relatively small. In the case of a compressor of small mass flow and pressure ratio and high operating speed, increased quantities of water ingestion give rise to large quantities of water in the tip region. GRA

EFFECT OF WATER ON AXIAL FLOW COMPRESSORS. PART 2: COMPUTATIONAL PROGRAM Final Report, 15 Dec. 1977 - 30 Sep. 1980
T. Tsuchiya and S. N. B. Murthy Wright-Patterson AFB, Ohio AFWAL Jun. 1981 425 p refs
(Contract F33615-78-C-2401; AF Proj. 3066)
(AD-A114831; AFWAL-TR-80-2090-Pt-2) Avail: NTIS HC A18/MF A01 CSCL 21/5

An analysis of the performance of an axial flow compressor operating with mixtures of gases and air-water droplet mixtures was performed. In the case of mixtures of gases, account was taken of the changes in molecular weight and ratio of specific heats. In the case of two phase flow, the major processes of interest are: (1) droplet blade interaction; (2) droplet heating; (3) droplet centrifuging; and (4) droplet break up. The PURDU-WICSTK program developed for the prediction of compressor performance was utilized to obtain the performance of a test compressor. A three dimensional stream line computer code, the UD-0300, was also modified and exercised in the case of compressor operation with mixtures of gases. Water ingestion into the compressor of an aircraft gas turbine engine affects the performance of the engine, and a preliminary analysis of the nature of the effects was also conducted. M.G.

AGRICULTURAL AIRPLANE MISSION TIME STRUCTURE CHARACTERISTICS
Joseph W. Jewel, Jr. Jul. 1982 44 p refs
(NASA-TM-84470; L-15125; NAS 1.15:84470) Avail: NTIS HC A03/MF A01 CSCL 01C

The time structure characteristics of agricultural airplane missions were studied by using records from NASA VGH flight recorders. Flight times varied from less than 3 minutes to more than 103 minutes. There was a significant reduction in turning time between spreading runs as pilot experience in the airplane type increased. Spreading runs accounted for only 25 to 29 percent of the flight time of an agricultural airplane. Lowering the longitudinal stick force appeared to reduce both the turning time between spreading runs and pilot fatigue at the end of a working day. Author

The handbook, comprised of three volumes, is intended to provide guidelines and procedures appropriate for Air Force Operational Test and Evaluation (OT/E) personnel to use in planning, conducting, and reporting the results of simulator assessment efforts. Although of value of all test personnel, it is primarily for the typical novice test manager/director-a person who has subject matter expertise (e.g., a qualified pilot or operator), but who may have little or no previous OT/E experience. The handbook provides detailed coverage on OT/E planning and management, with special emphasis on measuring device operational effectiveness and suitability. In accord with its objectives, the handbook was prepared to serve as a supplement to Air Force Manual 55-43, 'Management of Operational Test

Visual scene simulation concerning the landing of sporting aircraft in connection with investigations regarding the control and learning behavior of the pilot --- German thesis A82-41447

Effects of approach lighting and variation in visible runway length on perception of approach angle in simulated night landings [AD-A114742] N82-29290

AIRCRAFT MAINTENANCE

U.S. Marine Corps AV-8A maintenance experience [AIAA PAPER 81-2657] A82-38446

Rationalization of the maintenance process for helicopter Ka-26 A82-39246

Civil helicopter propulsion system reliability and engine monitoring technology assessments A82-40518

Age exploration in naval aviation --- Reliability Centered Maintenance program A82-40962

A82-38422 **The need for a dedicated public service helicopter design.** R. Morrison (Airborne Law Enforcement Association, Inc.; Huntington Beach Police Dept., Huntington Beach, CA). *Vertiflite,* vol. 28, July-Aug. 1982, p. 28-32.

A proposal is made for NASA to undertake a program to develop a technologically-advanced modular helicopter designed specifically for public service use, that is, for emergency medical services, fire fighting, wildlife management, law enforcement, etc. Public service helicopters currently in use have many unattractive features, such as high noise and cost, as a result of their original designs to satisfy military requirements, and are unable to meet the varied needs of public service operators. The proposed helicopter would have a high speed (200-300 knots), combined with effective night, all-weather operation, and could yield national benefits of over $90 billion per year, including: a greater ability to compete with foreign-made helicopters, a reduced response time in emergency situations, a greater effectiveness in law enforcement, and expanded job opportunities in the helicopter industry. N.B.

A82-38423 **JVX, what an opportunity.** C. C. Crawford, Jr. (U.S. Army, Aviation Research and Development Command, St. Louis, MO). *Vertiflite,* vol. 28, July-Aug. 1982, p. 34-39.

US military officials have proposed the creation of a Joint Services Advanced Vertical Lift Aircraft Program (JVX) to design a family of advanced technology vertical lift aircraft which could perform numerous, multi-service missions and achieve initial operating capability in the early 1990s. Six specific roles have been selected from the mission profiles to serve as a basis for molding requirements for a common multi-service air vehicle and the requirement for fulfilling world-wide self-deployment. The six roles - combat search and rescue, long range requirements, special electronics mission, signal intelligence, Marine Corps JVX, and self-deployment - are described in detail and schematics showing each of the mission profiles are included. A technical assessment group, which included representatives of the US Army Aviation Research and Development Command and NASA, reviewed possible configurations for the JVX and determined that tilt rotor configurations appear to offer the best possibility for a common multi-service design since they possess adequate hover efficiency, high-altitude and high speed capabilities as well as world-wide self-deployment. Other configurations studied, including lift/cruise fan configurations, conventional helicopters, and the auxiliary propulsion ABC/compound helicopter, all have serious drawbacks and are considered less attractive for the JVX. N.B.

A82-38439 # **Minimal order time sharing filters for INS in-flight alignment.** I. Y. Bar-Itzhack (Technion - Israel Institute of Technology, Haifa, Israel). *Journal of Guidance, Control, and Dynamics,* vol. 5, July-Aug. 1982, p. 396-402. 19 refs. Research supported by the Israel Aircraft Industries, Ltd., and Ministry of Defence.

Very simple reduced order filters which operate in a time sharing mode are proposed for in-flight and transfer alignment of calibrated inertial navigation systems (INS) such as those in fighter aircraft. The coarsely aligned INS is flown for a short duration in a straight and level flight during which two second-(or third-) order time sharing filters estimate the level misalignment. After removing the estimated level misalignment angles a third-(or fourth-) order filter is switched in to estimate the azimuth misalignment as the aircraft starts to maneuver in the lateral plane. A true covariance simulation is carried out, which shows that the proposed filters successfully perform the fine alignment. (Author)

A82-38441 # **Adaptive filtering for an aircraft flying in turbulent atmosphere.** H. Okubo (Osaka Prefecture University, Sakai, Japan). *Journal of Guidance, Control, and Dynamics,* vol. 5, July-Aug. 1982, p. 410-412. 5 refs.

On the basis of a sensitivity analysis for a simple scalar system, the deterioration of the Kalman filter performance resulting from incorrect noise covariance values is examined. It is found that the increase in the error covariance relative to the optimum value depends largely on the ratio of the process and the measurement noise covariance values. This is considered important in adaptive filtering problems when the system includes noises with extensively variable variance, such as the dynamics of aircraft flying through patches of atmospheric turbulence. C.R.

A82-38442 * # **Robust Kalman filter design for active flutter suppression systems.** W. L. Garrard (Minnesota, University, Minneapolis, MN), J. K. Mahesh, C. R. Stone (Honeywell Systems and Research Center, Minneapolis, MN), and H. J. Dunn (NASA, Langley Research Center, Hampton, VA). *Journal of Guidance, Control, and Dynamics,* vol. 5, July-Aug. 1982, p. 412-414. 6 refs. Contract No. NAS1-15486.

Additional insight is provided into the use of the Doyle-Stein (1979, 1981) technique in aeroelastic control problems by examining the application of the method to a flutter control problem. The system to be controlled consists of a full-size wind tunnel model of a wing, plus an aileron, an actuator, and an accelerometer used to sense the motion of the wing. A full-state feedback controller was designed using linear optimal control theory, and a Kalman filter was used in the feedback loop for state estimation. The filter design procedure is explained along with that to improve closed-loop properties of the system. The locus of the poles of the filter is examined as a scalar design parameter is varied. The Doyle-Stein design procedure is shown to substantially improve the stability properties of an active flutter controller designed using the linear quadratic Gaussian control theory. C.D.

A82-38443 * # **Aerodynamic characteristics of a large-scale, twin tilt-nacelle V/STOL model.** M. D. Falarski, M. R. Dudley (NASA, Ames Research Center, Moffett Field, CA), W. Buchmann (Grumman Aerospace Corp., Bethpage, NY), and A. Pisano (U.S. Naval Air Systems Command, Washington, DC). *(American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 19th, St. Louis, MO, Jan. 12-15, 1981, Paper 81-0150.)* Journal of Aircraft, *vol. 19, Aug. 1982, p. 627-633. 6 refs.*

A subsonic tilt-nacelle V/STOL aircraft configuration is described which is powered by two turbofan engines, mounted on a single carry-through structure that is designed to maintain the thrust axis close to the center of gravity at nacelle incidences of 5-95 deg. Control during V/STOL operation, often from small ship platforms, is achieved by means of a vane assembly that is immersed in each turbofan's exhaust. Wind tunnel test data have been obtained with an 11.2-m wing span model for the vertical-to-horizontal flight transition capability of the concept. It is found that the aircraft can operate over a broad transition corridor, with sufficient maneuver capability about the trim points. The control vane exhibited linear response characteristics over a large deflection range, with little influence from power, angle of attack or ground proximity in hover. The model induced a positive ground effect in hover that increased as wheel height was approached and strake angle increased. O.C.

A82-38445 * # **Influence of unsteady aerodynamics on hingeless rotor ground resonance.** W. Johnson (NASA, Ames Research Center, Low Speed Aircraft Research Branch, Moffett Field, CA). *Journal of Aircraft,* vol. 19, Aug. 1982, p. 668-673. 16 refs.
(Previously announced in STAR as N81-28056)

A82-38446 # **U.S. Marine Corps AV-8A maintenance experience.** L. Scott and R. W. Morrissey (U.S. Naval Air Rework Facility, Cherry Point, NC). *(American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, Paper 81-2657.)* Journal of Aircraft, *vol. 19, Aug. 1982, p. 694-696.*

The basic structure of the AV-8A employs a 2014T6 aluminum alloy, with an epoxy primer and a polyurethane paint system, which have together been shown by U.S. Marine Corps maintenance experience to be proof against corrosion. The vectorable engine nozzles and their drive system have proven to be so strong and reliable that vectoring has been used in forward flight for air combat maneuvering. Only fatigue damage to the empennage primary structure has been experienced, and this problem is being addressed by a reduction of operational time at high power, together with a rebuilding of the ventral fin with solid rivets. O.C.

A82-38447 # **Estimation of the peak count of actively controlled aircraft.** N. J. Meyerhoff and J. Garlitz (U.S. Department of Transportation, Office of Air and Marine Systems, Cambridge, MA). *Journal of Aircraft,* vol. 19, Aug. 1982, p. 698-700. 5 refs.

It is suggested by an analysis of preliminary data that a regression of the peak number of actively controlled aircraft on total daily operations yields an economical estimate of the peak instantaneous air count (AIC) over various air route traffic control centers (ARTCCs). It is possible to have a single general regression model for the entire continental U.S., or separate models for each ARTCC. In addition, peak models for terminal and en route centers appear possible, and improved estimates of peak ISC may be generated by regressing on component operations, consisting of departures, arrivals and overflights, rather than total daily operations. O.C.

A82-38461 **Complete flexibility and realism in radar simulation.** C. Buttars (International Aeradio, Ltd., Southall, Midox., England). *The Controller,* vol. 21, May 1982, p. 22, 23.

A digital air traffic radar simulator, developed for International Aeradio's air traffic control training school, achieves complete flexibility and realism in all aspects of radar training. The simulator uses a model flight information region to provide radar training capable of being applied anywhere in the world. The system has the capability to operate up to seven studen controller displays, each allowing combined radar/procedural exercises to be run. Three aircraft control units are provided, each capable of controlling 16 aircraft by keyboard input. The electric data display shows full aircraft data, computer replies to keyboard injected demands, and aircraft reports either as a result of keyboard injection or automatically. The simulator is programmed with the performance envelopes of 96 aircraft types (including indicated cruising speeds, rate of climb, descent speeds between three levels, and angles of bank), and allows only realistic flight characteristics. Also programmed are international standard atmosphere, and turn and indicated air speed data, which permit the aircraft to realistically simulate actual flying conditions. N.B.

A82-38462 **Future terminal area systems.** P. A. Jorgensen (Selenia-Industrie Elettroniche Associate S.p.A., Rome, Italy). *(International Federation of Air Traffic Controllers' Associations, West European Conference, Rome, Italy, Nov. 12-14, 1981.) The Controller,* vol. 21, May 1982, p. 34, 35. 6 refs.

The development of a terminal area computer system able to interface with existing flight management systems is discussed, and this type of system is intended to provide greater fuel conservation and air space capacity, with improved safety during the descent phase of flights. The system must be able to forecast a suitable approach routing, which will allow for a continuous descent of each aircraft, while also providing optimal distribution. Utilizing such a system, a controller would concentrate on monitoring the separation between the aircraft and would only rarely need to intervene in the landing process. Studies are being conducted to determine optimum approach patterns for such a system with regard to fuel conservation, safety and airspace capacity. A graph of the actual measured fuel consumption found for three different patterns - the standard descent profile, the low drag/low power approach, and a low drag/delayed flaps approach - is presented. N.B.

A82-38463 **The detection of low level wind shear. II.** P. D. Simmons. *The Controller,* vol. 21, May 1982, p. 36-38.

The Low Level Wind Shear Alert System (LLWSAS), a real-time micro-computer-controlled, data acquisition, analysis and display system for detecting horizontal wind shear near airports, is discussed, and the system's performance since its introduction by the FAA beinning in 1977 is analyzed. The system collects wind direction and wind speed data from six anemometers located near approach and takeoff areas of the airport, computes the wind gusts, and alerts controllers to wind shears by visual and audible alarms, and the information is then relayed to pilots in the area. While proof of the effectiveness of a system of this nature is extremely difficult to establish, it is noted that there have been no wind shear accidents in the US since 1977. One incident attributed to wind shear which occurred in Atlanta in 1979, but did not result in an accident, is discussed in detail. While the LLWSAS did not dectect wind shear conditions, it is shown that the wind shear occurred outside of the range of the system, but at a distance which allowed the pilot to recover and land safely. N.B.

A82-38464 **Fuel conservation: The airline - ATC.** P. M. Grundy. *The Controller,* vol. 21, May 1982, p. 39, 40, 47.

The air traffic control system has a greater impact on fuel conservation than any other factor in aviation, the most energy intensive industry in the world. The article discusses various measures that could be adopted by airlines and air traffic controllers to increase fuel conservation. These include: reducing operating empty weights, flying at optimum altitude, direct routing, linear holding, speed control, flight planning, loading for favorable center of gravity to reduce trim drag, minimizing route mileage, and clearance priorities for more fuel demanding aircraft during landing. N.B.

A82-38474 **A simplified approach to the free wake analysis of a hovering rotor.** R. H. Miller (MIT, Cambridge, MA). *(Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981.) Vertica,* vol. 6, no. 2, 1982, p. 89-95. 19 refs.
(Previously announced in STAR as N82-18121)

A82-38475 **Calculation of the cross section properties and the shear stresses of composite rotor blades.** R. Wörndle (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *(Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept 8-11, 1981.) Vertica,* vol. 6, no. 2, 1982, p. 111-129. 10 refs.
(Previously announced in STAR as N82-25334)

A82-38500 # **Wind shear - Its effect on an aircraft and ways to reduce the hazard. II (Uskok wiatru - Dzialanie na samolot, srodki zmniejszajace zagrozenie. II).** J. M. Morawski and T. Smolicz (Instytut Lotnictwa, Warsaw, Poland). *Technika Lotnicza i Astronautyczna,* vol. 37, May 1982, p. 5-8. 7 refs. In Polish.

A82-38722 † **Numerical methods for solving boundary value problems for noncavitating and cavitating flow past wing profiles (Chislennye metody reshenila kraevykh zadach beskavitatsionnogo i kavitatsionnogo obtekanila kryl'evykh profilei).** N. Iu. Zavadovskii, S. S. Maslennikov, and A. A. Rusetskii (Tsentral'nyii Nauchno-Issledovatel'skii Institut, Leningrad, USSR). *Gidromekhanika,* no. 45, 1982, p. 3-12. 6 refs. In Russian.

Algorithms are developed for the numerical solution of the following problems of the steady flow of an ideal incompressible fluid: noncavitating flow past an airfoil section, noncavitating flow past a wing profile, and flow past a profile with partial cavitation. An essential element of these algorithms is the computation of singular integrals and the solution of singular integral equations. S.J.

A82-38781 **Symposium on Flows with Separation, Stuttgart, West Germany, November 23-25, 1981, Reports (Symposium über Strömungen mit Ablösung, Stuttgart, West Germany, November 23-25, 1981, Vorträge).** Symposium sponsored by the Deutsche Gesellschaft für Luft- und Raumfahrt. Cologne, Deutsche Gesellschaft für Luft- und Raumfahrt, 1982. 147 p. In German and English. (For individual items see A82-38782 to A82-38786)

Aspects of viscous transonic airfoil flow simulation are considered along with investigations regarding vortex formation at wings with bent leading edges, leading edge separation at delta wings with curved leading edges in supersonic flow, and measurement and visualization of skin friction on the leeside of delta wings in supersonic flow. Attention is given to measurements of velocity distributions in the leading edge vortex of a delta wing by the laser-Doppler procedure, the topological structure of separated flows with three-dimensional boundary conditions, the calculation of boundary layers at fuselages, and a delta wing with a high vortex stability. Other topics investigated are related to an experimental study concerning two- and three-dimensional separation, and a theoretical investigation of separated flows in cascades of fluid kinetic machines. G.R.

A82-38783 # **Investigations regarding vortex formation at wings with bent leading edges (Untersuchungen über die Wirbelbildung an Flügeln mit geknickten Vorderkanten).** U. Brennenstuhl and D. Hummel (Braunschweig, Technische Universität, Brunswick, West Germany). In: Symposium on Flows with Separation, Stuttgart, West Germany, November 23-25, 1981, Reports. (A82-38781 19-02) Cologne, Deutsche Gesellschaft für Luft- und Raumfahrt, 1982. 4 p. In German.

It is pointed out that modern bomber aircraft employ presently almost exclusively wings with bent leading edges. There is currently a shortage of wind tunnel data which can provide detailed information regarding the characteristics of flows around such wings. For these reasons, an experimental program involving the study of a number of wings with the considered characteristics has been conducted in West Germany. The first results obtained in connection with this program have already been reported by Brennenstuhl and Hummel (1981). The present investigation is concerned with the remainder of the results obtained in the investigation. The effect of the angle by which the leading edge is bent on the flow characteristics is considered. Attention is given to measurements concerning the pressure distribution and the flowfield. G.R.

A82-38784 # **Leading edge separation at delta wings with curved leading edges in supersonic flow (Vorderkantenablösung an Deltaflügeln mit gekrümmten Vorderkanten im Überschall).** R. Henke (Berlin, Technische Universität, Berlin, West Germany). In: Symposium on Flows with separation, Stuttgart, West Germany, November 23-25, 1981, Reports. (A82-38781 19-02) Cologne, Deutsche Gesellschaft für Luft- und Raumfahrt, 1982. 14 p. 6 refs. In German.

Leeside flow types for delta wings are considered, taking into account the boundary provided by the Stanbrook-Squire region which divides the separation forms 'leading edge separation' and 'shock induced separation'. Basic information regarding the flow over wings with curved leading edges was obtained in studies conducted by Henke (1980) and by Ganzer and Henke (1981). An evaluation of oil film pictures provided an impression regarding the interference characteristics for the various wing components. A number of graphs are presented for the illustration of the obtained results. Some of the pictures were obtained by means of a vapor screen technique and a schlieren method. G.R.

A82-38785 * # **Measurement and visualization of skin friction on the leeside of delta wings in supersonic flow (Messung und Sichtbarmachung der Wandschubspannungen auf der Leeseite von Deltaflügeln im Überschall).** J. Szodruch (Vereinigte Flugtechnische Werke-Fokker GmbH, Bremen, West Germany) and D. J. Monson (NASA, Ames Research Center, Moffett Field, CA). In: Symposium on Flows with Separation, Stuttgart, West Germany, November 23-25, 1981, Reports. (A82-38781 19-02) Cologne, Deutsche Gesellschaft für Luft- und Raumfahrt, 1982. 9 p. 7 refs. In German.

The reported investigation was conducted with the aid of the NASA Ames High Reynolds Number Wind Tunnel. The flow conditions considered involved free stream Mach numbers of 2 and 3, and a Reynolds number of approximately 10,000,000 p. m. The employed model was a delta wing with an angle of 70 deg. A method reported by Tanner (1977) was used for the measurement of the skin friction. This method involves the use of a laser interferometer to determine the change in the thickness of an oil film. The procedure can also be employed for a visualization of skin friction in the form of interferograms. The investigation shows that skin friction measurements can provide a significant contribution to a physical understanding of the flow processes at the delta wing. G.R.

A82-38786 # **Measurements of velocity distributions in the leading edge vortex of a delta wing by the laser-Doppler procedure (Messungen**

Japan). In: Composite materials: Mechanics, mechanical properties and fabrication; Proceedings of the Japan-U.S. Conference, Tokyo, Japan, January 12-14, 1981. (A82-39851 19-39) Barking, Essex, England, Applied Science Publishers, 1982, p. 513-520.

Results of a fabrication study and materials properties tests of an advanced composite horizontal tail leading edge slat rail for the Japanese PS-1 STOL antisubmarine warfare seaplane are presented. The slat rail was fabricated of carbon fiber satin cloth and a bisphenolic epoxy resin matrix, with co-curing by vacuum injection. Static tests were performed to 100 and 180% of the design load limit and satisfactory results were obtained. Coating the slat rail with silicon grease resulted in good resistance to salt spray, although stiffness was reduced 5% after 24,000 cycles. High and low temperature environmental tests produced no degradation in the material. The composite slat rails had been flown for 1000 hr in flight tests by 1978 and performed to specification. M.S.K.

A82-39897 **Development status of a composite vertical stabilizer for a jet trainer.** K. Takagi and S. Idei (Fuji Heavy Industries, Ltd., Aircraft Engineering Div., Utsunomiya, Tochigi, Japan). In: Composite materials: Mechanics, mechanical properties and fabrication; Proceedings of the Japan-U.S. Conference, Tokyo, Japan, January 12-14, 1981. (A82-39851 19-39) Barking, Essex, England, Applied Science Publishers, 1982, p. 521-528.

Progress in a program to develop a composite materials vertical stabilizer for the next generation Japanese transonic military jet trainer is described. Focusing on graphite/epoxy materials, the tests to date cover small elements, components, and full scale main box trials. The stabilizer is about 2.4 m long with an area of 1.0 sq m, containing a two-spar multirib structure. All component parts are graphite/epoxy except the ribs and root fittings, which are aluminum. Tests have been run to examine the moisture temperature effects, rigidity, strain, and static loading to failure. Results have indicated no inherent difficulty in accepting a composite stabilizer on the trainer. M.S.K.

A82-39929 **Fasteners for composite structures.** R. T. Cole, E. J. Bateh (Lockheed-Georgia, Co., Marietta, GA), and J. Potter (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *(Symposium on Jointing in Fibre-Reinforced Plastics, London, England, July 13, 14, 1982.) Composites,* vol. 13, July 1982, p. 233-240. 16 refs.

The four basic problems with fasteners for composites - galvanic corrosion, galling, installation damage, and low pull-through strength - are identified. Seven special fastener systems for use in composites - bigfoots, semi-tubular rivets, Cherry Buck rivets, stress-wave rivet systems, groove proportioned lockbolts, composite fasteners, and self-tapping screws are described. Survey results are shown indicating that flush, low-load transfer, composite-to-composite joints are the most common in current composite structures. The rationale for selecting the flush head configuration as the modification considered is presented. Test results indicate that 100 deg tension countersink fasteners are the best for sheet thicknesses in excess of the head height. (Author)

A82-39930 **On the bearing strengths of CFRP laminates.** T. A. Collings (Royal Aircraft Establishment, Structures Dept., Farnborough, Hants., England). *(Symposium on Jointing in Fibre-Reinforced Plastics, London, England, July 13, 14, 1982.) Composites,* vol. 13, July 1982, p. 241-252. 12 refs.

Bearing strength measurements have been made on zero, + and - 45, zero, 90 deg and 90 + and - 45 deg carbon fiber reinforced plastic (CFRP) laminates made from three different fibre/resin systems; HTS/914, XAS/914 and HTS/HC 3501. Equations have been derived for predicting the ultimate bearing strengths of constrained pin-loaded holes using a semiempirical approach, and considering the physical conditions governing failure at the hole edge. Experimental results are presented and these show good agreement with those predicted for each of the laminate configurations and fibre/resin systems used. (Author)

A82-39996 † **Numerical solution of a problem concerning transonic flow past a wing-fuselage configuration (Chislennoe reshenie zadachi ob okolozvukovom obtekanii kryla s fiuzeliazhem).** V. I. Savitskii (Tsentral'nyi Aerogidrodinamicheskii Institut, Moscow, USSR). *Gidromekhanika,* no. 46, 1982, p. 41-47. 8 refs. In Russian.

Nonviscous transonic flow past an arbitrary wing-fuselage configuration is analyzed within the framework of the small-perturbation theory. A relaxation method is used in conjunction with a finite-difference scheme. Finite-difference approximations for the relaxation equation and boundary conditions are selected by using nonstationary analogy. To illustrate the method, calculations are carried out for several different wing-fuselage configurations. V.L.

A82-40051 **Noise pollution and airport regulation.** J. L. Helms (FAA, Washington, DC). *Journal of Air Law and Commerce,* vol. 47, Spring 1982, p. 405-412.

Methods are proposed of reversing the trend of curfews and other limitations on airport use that have been adopted across the U.S. in the name of noise reduction or environmental protection. The economic problems caused by airport restrictions are discussed along with the drawbacks of various types of restrictions. The situation in White Plains, New York is used as an example of the progress that can be made by holding litigation against restrictions in abeyance and cooperating with the FAA to bring about quick improvements. An example of a beneficial rule is allowing the quietest planes to operate at night rather than banning night flights altogether, as was the case in White Plains. The litigation route is briefly discussed, and the remedy of seeking systematic solutions is proposed, one combining legislation with FAA review. C.D.

A82-40052 **O'Hare International Airport - Impervious to proposed state efforts to limit airport noise.** M. J. Pavlicek (Schaffenegger, Watson and Peterson, Ltd., Chicago, IL). *Journal of Air Law and Commerce,* vol. 47, Spring 1982, p. 413-448. 199 refs.

The complexity of formulating a legally valid, technologically feasible, and economically reasonable state regulation that effectively abates noise at O'Hare International Airport is demonstrated. The federal responsibility for airport noise, federal preemption and the role of the airport proprietor, and the Illinois Pollution Control Board's jurisdiction over the airport noise proposal before it is briefly discussed, while the proposal itself is dealt with in detail. Particular attention is given to the variance procedure which mandates that the airport proprietor consider certain noise abatement methods which are under the control of another authority. Noise abatement activities that can be directly implemented by the proprietor, those that require federal approval, and those that are controlled by local zoning authorities are discussed. C.D.

A82-40057 **Touchdown technology.** J. Moxon. *Flight International,* vol. 122, July 24, 1982, p. 215-217.

The introduction of widebodied jets brought on a need for modifications in tires, brakes, and wheels to accommodate for weight. Radial tires are being tested as they offer a 15-20% weight reduction. Also, tires made of Guayule, a wild desert plant found in the southern United States and Mexico, are being tested. The evolution of brakes is discussed, with the most recent development being the use of carbon disks as they absorb more kinetic energy than steel without overheating. Carbon also offers weight reduction and long life, but a more cost efficient production method is being investigated. Variations in wheel production have been minimal and the current focus is on safety improvements and the use of titanium and aluminum alloys. NASA is studying a new landing method which involves the active control of landing gear so that forces transmitted to the airframe are reduced. R.K.R.

A82-40124 **Two-dimensional model studies of the impact of aircraft exhaust emissions on tropospheric ozone.** R. G. Derwent (Atomic Energy Research Establishment, Harwell, Oxon, England). *Atmospheric Environment,* vol. 16, no. 8, 1982, p. 1997-2007. 38 refs. Research sponsored by the Department of Environment.

The potential effects of aircraft operations in the troposphere were investigated with a two-dimensional (latitude-altitude) transport-kinetics model. There appears to be reasonable agreement between the present and previous studies that aircraft operations may have already increased ozone concentrations in the upper troposphere by up to a few per cent or so. The corresponding increases in the total ozone column amount to a few tenths of a per cent and may well have partially offset any decrease due to the release of chlorofluorocarbons 11 and 12. (Author)

A82-40276 # **Flying quality requirements for V/STOL transition.** C. G. Carpenter, J. Hodgkinson (McDonnell Aircraft Co., St. Louis, MO), R. H. Hoh (Systems Technology, Inc., Hawthorne, CA), and J. W. Clark, Jr. (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1293 . *8 p. 7 refs.*

A landing approach criterion showed excellent correlation of heave damping and pitch-to-path coupling effects. Blending schemes for transition from approach dynamics to hover dynamics, and vice versa, correlated well with earlier NASA results. A time response criterion discriminated well between attitude and rate systems in low speed and hover. Pilot's command gain has a strong effect on piloting charactersitics in all phases of transition. (Author)

A82-40287 # **Flying qualities requirements for roll CAS systems.** D. G. Mitchell and R. H. Hoh (Systems Technology, Inc., Hawthorne, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1356.* 9 p. 8 refs. Contract No. F33615-80-C-3604.

Command augmentation systems (CAS) are becoming essential components for modern fighters. A roll rate CAS utilizes an effective feedforward so that pilot control inputs are compared directly to actual roll response. Such CASs, as they are used today, can be limited in authority with parallel direct links, or full-authority with high command gains. The latter are the more interesting from a handling qualities standpoint. Attention is given to gradient shaping, roll responses for conventional aircraft, roll CAS gradients, roll ratcheting, implications for the handling qualities standard, roll performance, linearity, the roll mode time constant, and aspects of sensitivity. G.R.

A82-40290 * # **Flight-determined correction terms for angle of attack and sideslip.** M. F. Shafer (NASA, Flight Research Center, Edwards, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1374.* 11 p.

The effects of local flow, upwash, and sidewash on angle of attack and sideslip (measured with boom-mounted vanes) were determined for subsonic, transonic, and supersonic flight using a maximum likelihood estimator. The correction terms accounting for these effects were determined using a series of maneuvers flown at a large number of flight conditions in both augmented and unaugmented control modes. The correction terms provide improved angle-of-attack and sideslip values for use in the estimation of stability and control derivatives. In addition to detailing the procedure used to determine these correction terms, this paper discusses various effects, such as those related to Mach number, on the correction terms. The use of maneuvers flown in augmented and unaugmented control modes is also discussed. (Author)

A82-40294 * # **The use of linearized-aerodynamics and vortex-flow methods in aircraft design /Invited paper/.** J. E. Lamar (NASA, Langley Research Center, Transonic Aerodynamics Div., Hampton, VA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1384.* 17 p. 41 refs.

This paper deals with selected linearized-aerodynamic and vortex-flow methods as applied to aircraft design problems at high subsonic speeds. In particular, the NASA Vortex Lattice and Modified Multhopp methods are the linearized techniques employed, and the suction analogy is used to provide estimates associated with vortex-flow aerodynamics. Many examples are given as to how researchers at Langley have used these methods to design the high subsonic, wing-mean-camber shapes for various configurations such as a supersonic transport, high-aspect-ratio transport, trapezoidal fighter wing, strake wing, tandem wing, joined wing, delta wing, and slender cranked wing. Many of these have been built, tested, and have had their data compared with theory. In addition, a technique for defining efficiently performing strake planforms for use in strake-wing combinations is discussed, and further improvements in wing design are outlined. The latter may be obtained by using higher-ordered linear panel methods as well as nonlinear-transonic methods. (Author)

A82-40348 **Boeing's new 767 eases crew workload.** R. R. Ropelewski. *Aviation Week and Space Technology*, vol. 117, Aug. 23, 1982, p. 40, 41, 43 (3 ff.).

Details of the cockpit avionics and control switches and their operations in the Boeing 767 aircraft are described. Automation of the control and monitoring of most aircraft functions has permitted elimination of the flight engineer's station, and all controls are now within reach of the pilot and copilot. Each pilot is furnished electronic attitude director and horizontal situation indicators and flight management system control display units, in addition to sharing two centrally located 6 x 7 in. electronic displays giving engine indication and crew alerts. Standard electromechanical gages remain as a redundant feature, while checklist procedures are reduced to a short time. Flight paths and travel times are currently being programmed for easy access loading into the flight computer for automated guidance, with the computer tuning to navigations aids stationed along the flight path. M.S.K.

A82-40395 # **Summary of sting interference effects for cone, missile, and aircraft configurations as determined by dynamic and static measurements.** B. L. Uselton and D. R. Haberman (Calspan Field Services, Inc., Arnold Air Force Station, TN). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1366.* 16 p. 21 refs.

A summary of an AEDC technology program of sting effects on aerodynamic measurements is presented. Four different configurations - a 7-deg cone, 6-deg sliced-base cone, missile and an aircraft - were tested in the wind tunnel. Interference effects were obtained by measurements of damping derivatives, static data, surface pressures, and base pressures from subsonic to hypersonic Mach numbers. The critical sting limits were investigated as a function of frequency of oscillation, model boundary layer, type of measurement, angle of attack, Mach number, and configuration. Comparisons of wind tunnel and ballistic range data are presented for the missile and aircraft configurations. Critical sting length was found to be dependent on the parameter selected as the interference indicator. (Author)

Grant No. F33615-80-C-3617.

The development of a real-time simulation of a terrain following/terrain avoidance (TF/TA) system algorithm for use with an operating AFTI/F-16 simulator is described. The simulator is equipped with a control feel system, a single seat cockpit, an earth/sky and a target/terrain projection system, and motion and g-force provisions. A 5000:1 scale scenario of western Europe was chosen with night, dusk, and daylight capability in addition to cloud cover and weather configurations. The TF/TA control system is considered in terms of a preplanned ground track, with the mission proceeding from waypoint to waypoint, a computed flight path, for optimized aircraft performance on trajectories within the mission path, and aircraft control to follow the actual flight path. A feasible directions algorithm for obtaining the computed flight path is presented and operations are described. Further developments to complete the pilot-in-the loop strategies are discussed. M.S.K.

A82-40429 * # **Flight experience with a backup flight-control system for the HiMAT research vehicle.** R. W. Kempel (NASA, Flight Research Center, Edwards, CA). *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, San Diego, CA, Aug. 9-11, 1982, Paper 82-1541.* 20 p.

The NASA Dryden Flight Research Facility is conducting flight tests of two remotely piloted, subscale, advanced fighter configurations; the tests are part of the Highly Maneuverable Aircraft Technology (HiMAT) project. Closed-loop primary flight control is performed from a ground-based cockpit and digital computer in conjunction with an up/down telemetry link. A significant feature of these vehicles is an on-board, digitally active, backup control system designed to recover the vehicle in the event of a transfer from primary control. Automatic transfers occur upon certain critical ground or airborne system malfunctions. Control modes are provided that enable a ground or airborne controller to guide the vehicle to a safe landing. This paper describes the features, operational development, and flight evaluation of the HiMAT backup flight control system. (Author)

A82-40434 # **Analytical design and validation of digital flight control system structure.** D. B. Mulcare, W. G. Ness, and R. M. Davis (Lockheed-Georgia Co., Marietta, GA). *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, San Diego, CA, Aug. 9-11, 1982, Paper 82-1626.* 11 p. 17 refs.

Flight controls applications continue to be a dominant driver of applied digital technology, especially in the areas of fault-tolerant computer subsystems and flight-critical assurance methods. The present investigation is concerned with two of the major digital flight system technology needs, taking into account system validation technology and integrated methodology. Attention is given to the integration of assurance activities or provisions into the design process. The problem at hand is to formulate, develop, and validate an analytically based methodology which can dependably yield a readily validatable and maintainable digital flight control system. Questions of basic strategy are considered along with the technical approach, the control of complexity, a design description, aspects of system validation, and questions of development methodology. G.R.

A82-40943 # Optimal open-loop aircraft control for go-around maneuvers under wind shear influence. H. G. Jacob (Braunschweig, Technische Universität, Brunswick, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 654-664. 24 refs.

The optimization procedure is based on the representation of time dependent command inputs by analytical functions. The coefficients of these functions are iterated by a static search algorithm to values optimizing the behavior of the process. The longitudinal motion in heavy tail wind shear of the Airbus A 300 aircraft is described by a system of nonlinear equations of 4th order bounded by numerous design, safety and comfort constraints. The quality criterion is defined in a way to maximize the minimal distance between aircraft and ground as well as the area between flight path and ground. For these studies a very simple optimization program has been used which allows to consider boundaries and which comprises less than 100 FORTRAN-statements. The optimal input functions and other interesting variables are shown and discussed for the particular case that full power is available and for half power. (Author)

A82-40944 # The nonsynchronous whirls of the turbine rotor in aerojet engines. J.-L. Gu and P.-Z. Ren (Northwestern Polytechnical University, Xian, Shaanxi, People's Republic of China). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 665-673. 12 refs.

Several factors involved in the stability analyses of the supercritical overhung-rotor-bearing system of a specific type of aircraft engine are discussed. The phenomenon of 1/2 order subharmonic vibration within aerojet engines and its causes are assessed, and mathematical expressions for destabilizing forces are worked out. The latter include the unbalanced torque force due to circumferential variations of blade tip clearances, the frictional moment within splined coupling, and the aeroelasticity of labyrinth seals. Mathematical expressions for parametric excitation are found for the nonlinear stiffness of single-row deep-grooved ball bearings and for the nonlinear stiffness of the back support. Equations of motion of the high-speed overhung turbine rotor are derived. C.D.

A82-40945 # Fluctuating forces and rotor noise due to distorted inflow. G. Neuwerth, R. Staufenbiel, A. Kellner, and J. Schreier (Aachen, Rheinisch-Westfälische Technische Hochschule, Aachen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 674-688. 14 refs.

The influence of inflow distortions on the rotor blade forces and on their increased radiated noise is theoretically and experimentally investigated. Two types of distortions are considered, one involving a ducted rotor whose inflow is distorted by wakes, the other involving a helicopter tail rotor cutting the tip vortices of the main rotor. Fluctuations in the direction and magnitude of the flow relative to the blades is Fourier analyzed and the unsteady blade forces and pressures are computed on the basis of two and three-dimensional theories. The Fourier coefficients of these forces are used to compute the additional rotor noise emission due to the inflow distortions. Measurements of the unsteady blade pressures and the radiated noise power spectrum are in reasonable agreement with the theoretical results. C.D.

A82-40946 # An experimental and numerical study of 3-D rotor wakes in hovering flight. M. Nsi Mba, D. Favier, and C. Maresca (Aix-Marseille I, Université, Marseille, France). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 689-699. 12 refs. Direction des Recherches, Etudes et Techniques *Contract No. 78-456.*

Results of comparison between experimental and numerical studies on the 3-D wake of a hovering rotor are presented. The wind-tunnel investigation is conducted by means of X-hot wires and laser Doppler anemometry procedures to measure the 3-D velocity field under the rotor and to determine the tip vortex paths for several rotor configurations. Additional flow visualizations and rotor airloads coefficients are also carried out. The prediction model is based on the classical vortex theory with an empirically prescribed geometry of the wake. From the blade circulation distribution the rotor wake is represented by vortex lines which are allowed to freely adapt until a converged wake geometry is obtained. Then a new estimate of the blade circulation repartition can be deduced. The procedure is repeated, iterating until the compatibility between the adapted wake geometry and the blade circulation repartition is obtained. The validity range of the calculation model is deduced from comparison with experimental data obtained on instantaneous velocities and tip vortex paths, for different rotor parameters including solidy, number of blades, pitch angle, blade twist, and tip shape. (Author)

A82-40947 * # Aerodynamic interactions between a 1/6-scale helicopter rotor and a body of revolution. M. D. Betzina (NASA, Ames Research Center, Moffett Field, CA) and P. Shinoda (U.S. Army, Aeromechanics Laboratory, Moffett Field, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 700-711. 6 refs.

A wind-tunnel investigation was conducted in which independent, steady-state aerodynamic forces and moments were measured on a 2.24-m-diam, two-bladed helicopter rotor and a body of revolution. The objective was to determine the interaction of the body on the rotor performance and the effect of the rotor on the body aerodynamics for variations in velocity, thrust, tip-path-plane angle of attack, rotor/body position, and body nose geometry. Results show that a body of revolution near the rotor can produce significant favorable or unfavorable effects on rotor performance, depending on the operating condition. Body longitudinal aerodynamic characteristics are significantly modified by the presence of an operating rotor and hub. (Author)

A82-40948 # The prediction of propeller/wing interaction effects. A. S. Aljabri (Lockheed-Georgia Co., Marietta, GA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 712-719.

An analytical technique has been developed which predicts the influence of a propeller slipstream on a nacelle/wing combination. This is achieved by coupling a slipstream code with a complex configuration potential flow analysis code. The slipstream code is based on the vortex theory of propellers and predicts the slipstream in terms of its shape induced velocities and swirl angle. To verify the slipstream code two experiments with different model propellers were carried out. The wake immediately behind these propellers was surveyed and results compared with predictions. Good correlation is obtained. The coupling of the slipstream code with the panel code allows analysis of propeller slipstream/-nacelle/wing combinations. Results comparing the wing spanwise loading with and without slipstream are presented. The computational results are found to be in good agreement with experimental data. (Author)

A82-40949 # Wind-tunnel testing of V/STOL configurations at high lift. W. R. Sears (Arizona, University, Tucson, AZ). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 720-730. 12 refs. Contract No. N00014-79-C-0010.

The results of a study of the problem of the large airstream deflections involved in wind-tunnel testing of V/STOL configurations are reported. The concept of adaptive wind-tunnel walls is utilized to eliminate, along with boundary interference, the inaccuracies of the usual tunnel calibration. Some numerical models of adaptive-wall tunnels are described and it is shown that the undisturbed stream direction and magnitude, arbitrarily chosen, are achieved by the iterative process of such a tunnel. The use of this type of tunnel in an extreme case is demonstrated by constructing and model testing an approximate panel representation of a jet-flap wing of finite span. The demonstration is completely sucessful, suggesting that the new tunnel would solve the recurring problem of V/STOL testing. C.D.

A82-40950 # Estimation of simulation errors in the European Transonic Wind Tunnel /ETW/. B. Wagner (Dornier GmbH, Friedrichshafen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 731-740. 22 refs. Bundesministerium für Forschung und Technologie *Contract No. LVW-7901; European Transonic Wind Tunnel* Contract No. 79/01/68730/143963.

Simulation errors in cryogenic wind tunnels caused by real gas effects, changes in viscosity and heat conductivity characteristics at low temperatures, heat transfer, and local condensation are estimated theoretically. For this purpose viscous effects and heat transfer influences in transonic high Reynolds number turbulent flows are calculated by solving numerically the full Navier-Stokes equations for shock wave boundary layer interactions and by calculating boundary layers on airfoils, real gas equations of state and non-adiabatic walls being included in both procedures. Equilibrium condensation approximating the case of heterogeneous nucleation is investigated in transonic airfoil flows by means of numerical solutions of the full inviscid Eulér equations. The separation behavior is shown not to be sensitive to real gas effects and small amounts of heat transfer. The condensation influence is primarily seen by a considerable drag increase. (Author)

A82-40953 # Prediction of high alpha flight characteristics utilizing rotary balance data. W. Bihrle, Jr. (Bihrle Applied Research, Inc., Jericho, NY). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 781-788.

Rotational flow aerodynamic data, as measured by a rotary balance at low Reynolds number, are used to analytically predict steady spin modes and post-stall motions. The excellent agreement obtained between predicted and full-scale flight results would indicate that use of low Reynolds number rotary balance data is sufficient for calculating steady-spin modes for military configurations and general aviation configurations not having large wing leading-edge radii. Considerations, however, in the application of these low Reynolds number data to steady-state spin analysis, as well as large angle, six degree-of-freedom high alpha studies, are discussed. Also, the procedure for developing a configuration highly resistant to spins is illustrated. (Author)

A82-40955 # **Experimental and theoretical studies of three-dimensional turbulent boundary layers on an empennage of a typical transport airplane.** H. C. Seetharam, N. J. Pfeiffer, M. Ohmura, and J. D. McLean (Boeing Commercial Airplane Co., Seattle, WA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 784-795. 6 refs.

This paper describes experiments conducted to measure the three-dimensional incompressible turbulent boundary layers on the horizontal and vertical tails of a 1/5 scale model of a transport airplane empennage. The boundary layer measurements were made with a V-shaped anemometer with a high precision traversing mechanism. Variations of angle of attack and Reynolds number were included in the tests. Measurements were also made with small elevator and rudder deflections. The data includes extensive pressure distributions, and detailed analyses of three-dimensional boundary layer data. Comparison of the experimental data with a three-dimensional boundary layer code taking into account viscous-inviscid interaction is shown. Details of the test theory comparison and the need for a better turbulence model are discussed. (Author)

A82-40956 # **Requirements and trends in fuel consumption in transport mission with aircraft and surface vehicles.** G. Gabrielli. In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 796-799.

A discussion is presented of the energy utilization factor, f, which relates the payload product of a vehicle, yielded by weight and route distance, to the mechanical energy used. Values of f are presented which have been derived from several hundred sea, land and air vehicles of 15 different types in view of their customary missions. It is demonstrated that turboprop aircraft, and to an even greater degree turbojet aircraft, are the only types of vehicles which offer higher transport speeds without a corresponding reduction in the energy utilization factor. O.C.

A82-40957 # **Aerodynamic concepts for fuel-efficient transport aircraft.** G. Krenz and R. Hilbig (Vereinigte Flugtechnische Werke GmbH, Bremen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 800-810. 8 refs.

The rapid inflation of jet fuel prices in the last decade contributes largely to the growing operating expenses of the airlines and to a disproportionate share of the Direct Operating Costs (D.O.C.) as well, wherein the fuel share is already dominant. This report describes the influence of the increasing fuel costs on the aircraft design and explains the manner in which the lift/drag ratio as design parameter is steadily increasing in importance compared to the weight. The evaluation of the fundamentals for a new fuel efficient aircraft is a challenge for both, designer and aeronautical research. On the other hand there still exist potentials for performance improvements in terms of L/D for most of the current aircraft in service, as they were generally designed for minimum weight performance. This paper gives examples for aircraft modifications for performance improvement and shows potentials for future designs in the field of aerodynamics. (Author)

A82-40958 # **Progress at Douglas on laminar flow control applied to commercial transport aircraft.** W. E. Pearce (Douglas Aircraft Co., Long Beach, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 811-817.

Design studies, development efforts and testing related to laminar flow control for subsonic commercial transport aircraft are described in this paper. The paper covers selection of a suitable suction surface, integration of the suction system, and results of LFC aircraft design studies. Current programs which include wind tunnel testing and flight testing are discussed as well as proposed future LFC activities. (Author)

A82-40959 # **Cracks interacting with contact forces - A finite element study on loaded holes.** H. Ansell and B. Fredriksson (Saab-Scania AB, Linköping, Sweden). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 818-826. 17 refs. Research supported by the Forsvarets Materielverk.

A computerized method for the simultaneous solution of the contact and stress intensity factor problem has been developed. The solution is based upon the finite element method using virtual crack extension method for stress intensity factor calculations. The method is generally applicable to both two- and three-dimensional problems and both through- and part-through cracks could be studied. The method has been applied to a lug with prestressed sleeve and shaft. Both single- and doublesided cracks are studied. Contact pressures and stress intensity factors during crack propagating are presented. The stress intensity factors are compared with experimental results. The importance of the simultaneous solution of the contact and crack problem is demonstrated. (Author)

A82-40961 # **A crack growth model under spectrum loading.** S.-X. Yang (Beijing Institute of Aeronautics and Astronautics, Beijing, People's Republic of China). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 837-843. 12 refs.

In the present study, based on the mechanisms of delayed retardation of overload retardation effect, an analytical equation for predicting the delayed retardation parameter is presented. Further, a model for predicting the retardation under tensile overloads and tensile-compressive overloads is proposed, and it can be used to predict the fatigue crack growth rate and fatigue life under complex spectrum loading. And as an example, the retardation effects of some materials under different loading conditions are predicted. The fatigue life of stiffened panel of wing and landing gear of aircraft under complex spectrum loadings are predicted. Predictions agree very well with experimental results. (Author)

A82-40962 # **Age exploration in naval aviation.** A. D. Williams (U.S. Navy, Naval Aviation Logistics Center, Patuxent River, MD). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 844-850.

In this paper, an overview of the United States Navy's newly developed aviation age exploration process is given. As age exploration is a subset of the Reliability-Centered Maintenance (RCM) program, the underlying concepts of age exploration, RCM, and their relationship to each-other, are explored. Age exploration is depicted as a multi-faceted analyzation, marrying diverse types of information with maintenance engineering logic and statistical formulation. Specific applications of the age exploration process in the Navy's aviation community are presented. It is shown how the knowledge gained from age exploration enables the designer of the RCM requirements to effect maximum uptime of the equipment at the lowest cost within the bounds of safety. (Author)

A82-40963 # **Logistics research program in the United States Air Force.** J. C. Reynolds and P. E. Davidson (USAF, Coordinating Office for Logistics Research, Wright-Patterson AFB, OH). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 851-853.

An assessment is given of the factors which contribute to the lack of interest and investment of resources in logistics research and development, with emphasis on the need to integrate the consideration of logistics into research and development activities, and attention to the program developed toward that end by the U.S. Air Force. USAF program results demonstrate that any agency with logistics responsibilities can improve its technical capabilities and operational methods through management attention and the cooperation of the logistics and research and development communities. O.C.

A82-40964 # **Third generation turbo fans.** J. F. Coplin (Rolls-Royce, Ltd., Derby, England). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 857-878.

The modular design concept of the RB211 family of turbofan aircraft engines has allowed the progressive improvement of fuel efficiency through refinement of the design of individual components, resulting in gradual increases of optimum pressure and bypass and temperature ratios. The RB211-535E4, which is the latest engine derived from the basic RB211 design and is destined for use by the 757 airliner, incorporates inherent precision tip clearance control, thermal barrier coatings, creep-resistant titanium alloys, supercritical airfoil designs, a single tion of simple pendulums on the blades of a helicopter rotor to suppress the root reactions is presented. A frequency response analysis is conducted of typical rotor blades excited by a harmonic variation of spanwise airload distributions as well as a concentrated load at the tip. The results presented included the effect of pendulum tuning on the minimization of the hub reactions. It is found that a properly designed flapping pendulum attenuates the root out-of-plane force and moment whereas the optimum designed lead-lag pendulum attenuates the root in-plane reactions. For optimum pendulum tuning the parameters to be determined are the pendulum uncoupled natural frequency, the pendulum spanwise location and its mass. It is found that the optimum pendulum frequency is in the vicinity of the excitation frequency. For the optimum pendulum a parametric study is conducted. The parameters varied include prepitch, pretwist, precone and pendulum hinge offset. Author

This report summarizes Task 1-Requirements Analysis and Task 2-Conceptual Design and documents the results of Task 3, Phase I, of this two-phase program. Task 3 is the preliminary design of an advanced aircraft electrical system (AAES). The AAES is designed to meet the requirements of a 1990 time frame two-engine tactical aircraft with multi-mission capability. The AAES performs the functions of power generation, distribution and control of power to loads, system protection, and load management. Key characteristics of the AAES are: Integrated avionics and power data bus configuration consisting of Digital Avionics Information System (DAIS) standard elements (MIL-STD-1750 processor, MIL-STD-1553B data bus, controls and displays, and remote terminals (RT)). Intelligent Electrical Load Management Centers (ELMC) capable of controlling power to loads; Built-in-test (BIT) capability to isolate faults to the module level. BIT includes both circuit and data monitoring checks. Solid State Power Controllers (SSPC) to replace circuit breakers and power control switches. SSPCs are turned on/off via computer control. Generator control, protection and status monitoring by a Generator Control Unit (GCU) compatible with DAIS hardware and software. Multimission data information system through programmable system processors, ELMCs and standard DAIS elements. Automatic load management for increased aircraft survivability and probability of mission completion. GRA

EVALUATIONS OF HELICOPTER INSTRUMENT-FLIGHT HANDLING QUALITIES
S. R. M. Sinclair and S. Kereliuk Jan. 1982 49 p refs In ENGLISH; FRENCH summary
(AD-A114004; NRCC-LR-608) Avail: NTIS HC A03/MF A01 CSCL 01/2

The NAE Airborne Simulator, a modified and suitably equipped Bell 205A helicopter, was used in experiments to provide background information on the handling qualities requirements for helicopter instrument flight. This investigation was in support of a regulatory review undertaken by the U.S. Federal Aviation Administration as part of an overall assessment of the helicopter certification process. The results illustrate the inter-dependence of the various stability and control characteristics which contribute to safe instrument flight handling qualities, and underline the importance of good mission simulation in conducting certification-related experiments. ADVANCED TRENDING ANALYSIS/EDS DATA PROGRAM Final Report, May 1979 - Sep. 1981
David C. Perryman Wright-Patterson AFB, Ohio AFWAL Jan. 1982 181 p refs
(Contract F33615-78-C-2070; AF Proj. 3066)
(AD-A113511; AFWAL-TR-81-2125) Avail: NTIS HC A09/MF A01 CSCL 09/2

Ground, flight, and maintenance data was collected during the F-15/F100 Engine Diagnostic System (EDS) Flight Evaluation and provided to the Air Force Aero-Propulsion Laboratory (AFWAL/POTC). This data was used by the Air Force, in a concurrent program, to verify a gas turbine engine fault detection/isolation and health trending algorithm employing gas path analysis. In addition, the EDS Flight Evaluation served as a demonstration vehicle for a prototype Maintenance Information Management System (MIMS). Independent assessments of the gas path analysis algonthm and of the prototype MIMS were performed and the results are presented. Several lessons learned about the automatic recording of in-flight trending data for high performance gas turbine engines in modern tactical aircraft are also presented. Author (GRA)

KINEMATIC INVESTIGATION HUGHES HELICOPTER 7.62mm CHAIN GUN
R. P. Kaste Feb. 1982 48 p refs
(DA Proj. 1L1-62617-AH-19)
(AD-A113114; AD-F300017; ARBRL-MR-03157) Avail: NTIS HC A03/MF A01 CSCL 19/6

A kinematic study of the Hughes Helicopter 7.62mm Chain Gun was performed to determine the power required to operate the weapon and loads on the stud roller due to the various components of the weapon. Using a 24-volt battery system the gun drew up to 60 amperes to start and operated on 22 amperes. The stud roller carries a load up to 497 Newtons. GRA

RESEARCH MODEL WING/TAIL FABRICATION Technical Report, 17 Aug. 1981 - 18 Jan. 1982
Ronald A. Cox Mar. 1982 9 p
(Contract N00014-81-C-0680)
(AD-A114101; FZA-535) Avail: NTIS HC A02/MF A01 CSCL 14/2

The design and construction of a transonic wind-tunnel model has been completed. The 1/7.5-scale model can be equipped with an all-flying low-, mid-, or T-tail. A baseline, linear element wing and an alternate wing of identical planform, but with chordwise airfoil sections optimized for transonic cruise, have been manufactured. One row of pressures is located on each wing and on the horizontal tail. Author (GRA)

HISS CALIBRATION, ICE PHOBICS AND FAA R/D EVALUATIONS Final Report, Jan. - Mar. 1981
John C. Henderson, Ralph Woratschek, and Loran A. Haworth Aug. 1981 62 p refs
(AD-A114435; USAAEFA-80-13) Avail: NTIS HC A04/MF A01 CSCL 01/3

Artificial and natural icing tests of a JUH-1H helicopter were flown in the vicinity of St. Paul, Minnesota, during the three month period of January through March 1981. Productive flight time totaled 15.4 hours in the artificial icing environment behind the Helicopter Icing Spray System (HISS) and 3.2 hours in natural icing. Test conditions ranged from -5 C to -20 C and 0.25 to 1.0 gram per cubic meter liquid water content (LWC) for the artificial testing and -6 C to -9 C and 0.1 to 0.5 gram per cubic meter LWC for the natural testing. Tests in the artificial icing environment behind the HISS were flown to define the nature of the HISS cloud in terms of LWC, cloud particle size and distribution; and to quantitatively determine the effects of an ice phobic coating on the capability of the UH-1H to fly in

icing conditions. The ice phobic coating did not significantly affect the capability of the UH-1H to fly in icing conditions.

HISTORICAL RESEARCH AND DEVELOPMENT INFLATION INDICES FOR ARMY FIXED AND ROTOR WINGED AIRCRAFT Annual Report
Charles W. Lines, Jr. and William J. Waymire Jan. 1982 37 p refs
(AD-A114368; USAAVRADCOM-TR-82-F-3) Avail: NTIS HC A03/MF A01 CSCL 05/1

This Technical Memorandum is a continuation of previous efforts to develop the necessary rationale and methodology needed in order to construct historical inflation indices, in the Research and Development (R&D) area, relative to Army aircraft. The R&D historical indices, and the sub-indices from which they are derived, are presented in the appendices to this report for the period FY68 through FY81. These indices are appropriate for updating statistical reports that formerly utilized the OSD forecasting indices; for initial use in bringing a cost in prior years to a present-year dollar value; and for evaluating inflation actually experienced. A computer program is utilized to make the necessary mathematical calculations. Data sources for this report were the Office of Personnel Management (OPM) and the Bureau of Labor Statistics (BLS). OPM supplied data on government salaries. BLS furnished data on industry salaries and thirteen different materials. The computer program prints the R&D historical inflation indices and subindices by fiscal year as shown in Appendices C through G of this report. GRA

LOW COST DEVELOPMENT OF INS SENSORS FOR EXPENDABLE RPV CONTROL AND NAVIGATION Final Report, Apr. 1979 - May 1981
D. G. Kim and James G. Russell Wright-Patterson AFB, Ohio AFWAL Aug. 1981 71 p
(Contract F33615-79-C-3616)
(AD-A112691; AFWAL-TR-81-3086) Avail: NTIS HC A04/MF A01 CSCL 01/3

A two year development effort has resulted in the design, fabrication and test of a feasibility model 3-axis vibrating beam accelerometer and a brassboard cycloidal magnetic vector sensor. The cycloidal magnetic vector sensor is based on a rotating coil technique which eliminates slip rings. It performed as expected, and demonstrated an accuracy of approximately 0.25 degrees. The 3-axis vibrating beam accelerometer is based on the principle that a vibrating beam will change its frequency as a function of the applied tension. Using six beams, two per sensing axis, connected to a common mass, a 3-axis accelerometer can be designed. Such a design measures acceleration, by a change in beam vibration frequency, as a function of applied acceleration to the mass. The accelerometer, at first, demonstrated an insensitivity due to frequency lock between the beams. This effect was eliminated, but the necessary change in design caused an unstable bias and non-linearity of the scale factor. A solution to these problems was also conceived, and hardware changes made. However, to fully demonstrate the concept requires a computer and software, which is outside the scope of this program.

DESIGN STUDY FOR A LOW-DISTORTION HOLOGRAPHIC HUD Final Technical Report, Jul. 1980 - Aug. 1981
W. S. Colburn and R. C. Fairchild Wright-Patterson AFB, Ohio AFWAL Jan. 1982 104 p refs
(Contract F33615-80-C-1077)
(AD-A113982; AFWAL-TR-81-1263; ERIM-150800-29-F) Avail: NTIS HC A06/MF A01 CSCL 14/5

A low distortion holographic HUD optical system was examined. Distortion correction was based on the use of a holographic combiner made with analytically defined construction wavefronts, wavefronts for which the phase at the hologram is described by mathematical expressions. Such wavefronts are designed subsequent to the hologram design, and offer great design flexibility as their realization is based in part on the use of computer generated holograms. A method for designing the construction wavefronts of a holographic optical element based on minimizing the mean squared wavefront error while satisfying the Bragg condition is described. A holographic HUD optical system was designed for the F-16 cockpit in which distortion was corrected optically through simultaneous optimization of combiner and relay lens parameters. Both construction wavefronts of the combiner were described in terms of Legendre polynomial series. The implementation of construction beams required to form the combiner construction wavefronts is discussed. Author (GRA)

HYDRAULIC UNIVERSAL DISPLAY PROCESSOR SYSTEM (HUDPS) Final Report, 1 Apr. - 1 Sep. 1981
John J. Duzich and Herman L. Dreisler Warminster, Pa. Naval Air Development Center 21 Nov. 1981 66 p refs
(Contract N62269-81-C-0243)
(AD-A114428; NADC-82062-60) Avail: NTIS HC A04/MF A01 CSCL 01/3

This six month study effort explored methods of display fault indication to ground support personnel and optimize microprocession circuitry for universal aircraft application. Task I was established the maximum number of sensors required for a complex, comprehensive diagnostic system for the F14A as 150: Inputs could be either analog or digital. For comparison purposes, an AGE system was considered. Fault display methods were investigated with emphasis on smart alphanumeric devices in Task II. Volatile and non-volatile memory components were utilized along with the Intel 8748 microprocessor and associated EPROMS. The use of National Semiconductor ADC0816 data acquisition chips consisting of a 16 input multiplexer, an 8 bit A/D converter and an 8 bit tri-state buffered output facilitates the many inputs. Power consumption for a complete system was estimated as 5 watts while airborne. On the ground, 15 watts at 5 volts is required for display requirements. Display envelope would measure 8x7x6 and would contain approximately 6 circuit boards. In Task III a universal display processor system was formulated. A Block Diagram and several flow diagrams were generated. Multiplexer schematics were established for analog and discrete inputs. An electrical component parts list was generated for a typical system. Author (GRA)

STATIC NOISE TESTS ON MODIFIED AUGMENTOR WING JET STOL RESEARCH AIRCRAFT
G. R. Cook and B. F. Lilley (deHavilland Aircraft of Canada, Ltd., Downsview, Ontario) Feb. 1981 58 p refs
(NASA-TM-81231; NAS 1.15:81231) Avail: NTIS HC A04/MF A01 CSCL 21E

Noise measurements were made to determine if recent modifications made to the bifurcated jetpipe to increase engine thrust had at the same time reduced the noise level. The noise field was measured by a 6-microphone array positioned on a 30.5m (100 ft) sideline between 90 and 150 degrees from the left engine inlet. Noise levels were recorded at three flap angles over a range of engine thrust settings from flight idle to emergency power and plotted in one-third octave band spectra. Little attenuation was observed at maximum power, but significant attenuation was achieved at approach and cruise power levels.

B747/JT9D FLIGHT LOADS AND THEIR EFFECT ON

and Evaluation', by providing those specific additional evaluation concepts and techniques necessary for aircrew training device (ATD) test and evaluation. Volume 1 is concerned, first with describing both general and specific ATD OT/E planning and management considerations and links those events which occur early in the ATD acquisition process to later ATD OT/E planning and management activities. It defines the various evaluation concepts germane to understanding ATD OT/E, and describes the two major ATD OT/E activities--Initial/Qualification OT/E and Follow-on OT/E; matters of ATD value and worth to the Air Force. The acquisition and life cycle costs associated with modern ATDs make such concerns important. GRA

THE USE OF A MULTI-DEGREE-OF-FREEDOM DUAL BALANCE SYSTEM TO MEASURE CROSS AND CROSS-COUPLING DERIVATIVES Final Report, 1 Oct. - 1 Nov. 1981

D. R. Haberman AEDC Apr. 1982 92 p refs Sponsored by Air Force
(AD-A114813; AEDC-TR-81-34) Avail: NTIS HC A05/MF A01 CSCL 12/1

The equations of motion are derived for two existing dual balance systems used at the Arnold Engineering Development Center (AEDC) to obtain measurements of aerodynamic cross and cross-coupling derivatives. The complete equations of motion presented include the effects of sting motion. Each system incorporates a dynamic cross flexure balance and a five-component static balance. The primary deflection modes of the balances were confirmed using a holographic interferometry measurement technique. Both laboratory and wind tunnel data are presented to illustrate dynamic effects. ETHANOL PRODUCTION BY VAPOR COMPRESSION DISTILLATION Final Report

George S. Ellis 1981 9 p
(Contract DE-FG02-80R5-10240)
(DE82-004892; DOE/R5-10240/2) Avail: NTIS HC A02/MF A01

It was the goal of the project to develop and demonstrate a one (1) gallon per hour vapor compression distillation unit for fuel ethanol production that could be profitably manufactured and economically operated by individual family units. The unit constructed was originally built for strictly ambient temperature operation, but later modified to permit elevated temperature operation. It successfully separated ethanol from a dilute solution, but only at a very low production rate. The initial configuration had the compressor located outside of the distillation vessel and was losing excessive energy to the environment. Therefore, it would not be possible to operate that design at elevated temperature. Thus, the compressor was moved inside the distillation vessel. DOE

WATER-COMPATIBLE POLYMER CONCRETE MATERIALS FOR USE IN RAPID REPAIR SYSTEMS FOR AIRPORT RUNWAYS Final Report, Mar. 1980 - Feb. 1981

T. Sugama and L. E. Kukacka Mar. 1981 128 p refs
(Contracts AFOSR ISSA 80-00027; DE-AC02-76CH-00016; AF Proj. 2307)
(DE82-010994; BNL-51390; AFOSR-81-0589TR) Avail: NTIS HC A07/MF A01

Water-compatible polymer concrete (PC) formulations were developed which appear to have potential for use in all-weather rapid repair procedures for bomb-damaged runways. Formulations consisting of furfuryl alcohol, water-saturated aggregate, dry silica flour, promoters, and catalysts produced composites with properties suitable for repair purposes when mixed and polymerized at temperatures from -200 to 300 C. Calcium-unsaturated polyester complexed PC also produced excellent properties. However, the early strength criteria [2000 psi (13.78 MPa) at 1 h] and other requirements such as compatibility of the formulation with water and practical working times could be attained only at temperatures > 200 C. This system can be polymerized under water. Studies of the polymerization reaction mechanisms, materials properties, costs, and potential placement methods were performed. DOE

UNITED STATES AIR FORCE SHALE OIL TO FUELS, PHASE 2 Interim Technical Report, 1 Apr. 1979 - 30 Sep. 1980

J. R. Wilcox, J. G. Sikonia, T. G. Board, and F. J. Riedl Wright-Patterson AFB, Ohio AFWAL Nov. 1981 295 p refs
(Contract F33615-78-C-2079)
(AD-A114531; AFWAL-TR-81-2116) Avail: NTIS HC A13/MF A01 CSCL 21/4

Phase II of this project was conducted to demonstrate innovative technology to reduce the cost of converting shale oil to high yields of aviation turbine fuels. To carry out this program, UOP selected a processing scheme involving hydrocracking as the primary conversion unit. The Phase II program included pilot plant processing, fouling studies and economic analysis. The pilot plant operations performed during Phase II involved four specific processing steps: feed preparation, low pressure hydrotreating, high pressure hydrotreating, and hydrocracking. Two shale oil feedstocks were utilized for each processing step: shale oil derived from Occidental Modified In-Situ retort and shale oil obtained from the Paraho direct-heated retort. Using data generated from the pilot plant operations and the study basis provided by the USAF, economic analyses were performed to find the cost of production of jet fuel, and total liquid product at a 15% discounted cash flow rate of return (DCFRR) on investment. SYSTEM DATA COMMUNICATION STRUCTURES FOR ACTIVE-CONTROL TRANSPORT AIRCRAFT, VOLUME 1 Final Report

A. L. Hopkins, J. H. Martin, L. D. Brock, D. G. Jensson, S. Serben, T. B. Smith, and L. D. Hanley Jun. 1981 236 p refs 2 Vol.
(Contract NAS1-15359)
(NASA-CR-165773-Vol-1; NAS 1.26:165773-Vol-1; R-1469-Vol-1) Avail: NTIS HC A11/MF A01 CSCL 17B

Candidate data communication techniques are identified, including dedicated links, local busses, broadcast busses, multiplex buses, and mesh networks. The design methodology for mesh networks is then discussed, including network topology and node architecture. Several concepts of power distribution are reviewed, including current limiting and mesh networks for power. The technology issues of packaging, transmission media, and lightning are addressed, and, finally, the analysis tools developed to aid in the communication design process are described. There are special tools to analyze the reliability and connectivity of networks and more general reliability analysis tools for all types of systems. S.L.

SYSTEM DATA COMMUNICATION STRUCTURES FOR ACTIVE-CONTROL TRANSPORT AIRCRAFT, VOLUME 2 Final Report
A. L. Hopkins, J. H. Martin, L. D. Brock, D. G. Jansson, S. Serben, T. B. Smith, and L. D. Hanley Jun. 1981 156 p refs 2 Vol.
(Contract NAS1-15359)
(NASA-CR-165773-Vol-2; NAS 1.26:165773-Vol-2; R-1469-Vol-2) Avail: NTIS HC A08/MF A01 CSCL 17B

The application of communication structures to advanced transport aircraft are addressed. First, a set of avionic functional requirements is established, and a baseline set of avionics equipment is defined that will meet the requirements. Three alternative configurations for this equipment are then identified that represent the evolution toward more dispersed systems. Candidate communication structures are proposed for each system configuration, and these are compared using trade off analyses; these analyses emphasize reliability but also address complexity. Multiplex buses are recognized as the likely near term choice with mesh networks being desirable for advanced, highly dispersed systems. S.L.

MOVING TARGET DETECTOR (MOD 2)
David Karp and John R. Anderson 3 Nov. 1981 159 p refs
(Contracts DOT-FATO-WAI-679; F19628-80-C-0002)
(AD-A114709; ATC-95; FAA-RD-80-77) Avail: NTIS HC A08/MF A01 CSCL 17/9

Under FAA sponsorship, MIT/Lincoln Laboratory has developed a second generation, field operable Moving Target Detection System (MTD-II) which has been tested at operational FAA terminal and enroute radar sites, and serves as the basis for the ASR-9 MTD technical performance specifications. This summary report covers the period October, 1976 through September, 1979 in which design, development, field testing and system performance evaluation were carried out. Report No. FAA-RD-76-190, ATC-69, 'Description and Performance Evaluation of the Moving Target Detector' dated 8 March 1977, serves as the technical foundation of this work. MTD-processing design modifications were effected to handle conditions of excessive ground clutter and moving ground traffic. The rationale for the modified algorithms is provided, and measured performance characteristics at several FAA field sites are discussed. Author (GRA)

PROPAGATION PROBLEMS ASSOCIATED WITH AIRCRAFT COMMUNICATIONS SYSTEMS
B. Burgess *In* AGARD Electromagnetic Propagation Probl. in the Tactical Environ. Apr. 1982 10 p refs (For primary document see N82-29527 20-32)
Avail: NTIS HC A08/MF A01

Communications with mobiles is assuming increasing importance in a military context, with the advances in technology enabling not only greater amounts of information to be transferred, but also fostering a much harsher electromagnetic environment. The trend towards digital communications systems coupled with the possible demand for the wider bandwidths means that the propagation medium characteristics that influence the performance of these links are somewhat different from those that need to be addressed for narrowband analogue modulation transmissions. The various types of communications systems that are used with aeromobile platforms are reviewed and the various propagation problems that arise in achieving systems with good overall performance discussed. The links are conveniently divided into two types: beyond line of sight and line of sight systems, and span the frequency range from LF through to microwaves. Author

COMPUTER ENHANCED ANALYSIS OF A JET IN A CROSS-STREAM
John W. Trischka and Nancy J. Birkenheuer (Midwest Research Inst., Golden, Colo.) 22 Feb. 1982 41 p refs Backup document for AIAA synoptic scheduled for publication in the AIAA Journal, Feb. 1983
Avail: NTIS HC A03/MF A01

Previously analyzed velocity data for a jet in a wind tunnel cross stream was used in a computer analysis which, through interpolation and extrapolation, produced velocity and vorticity fields on a uniform, three dimensional grid. Microfilm output from the computer displayed isopleths on sets of planes in three orthogonal directions. Improved determinations were made of the jet center line, of the center lines of the bound vortices and of the jet boundaries. Stationary waves were discovered in the mixing region on the upstream side of the jet. An explanation for these waves is proposed. The angle between vorticity and velocity is used to compare the flow with complex lamellar and Beltrami flows. A convergence feature in the jet wake is noted. Author

CORRELATION OF PRESTON-TUBE DATA WITH LAMINAR SKIN FRICTION (LOG NO. J12984)
T. D. Reed (Oklahoma State Univ., Stillwater), A. Abu-Mostafa (Oklahoma State Univ., Stillwater), and F. W. Steinle, Jr. 18 Jan. 1982 37 p refs Backup document for AIAA Synoptic scheduled for publication in AIAA Journal in Feb. 1983
(Grants NSG-2396; NAG2-78)
(NASA-TM-84827; NAS 1.15:84827; Log-J12984) Avail: NTIS HC A03/MF A01 CSCL 20D

Preston tube data within laminar boundary layers obtained on a sharp ten-degree cone in the NASA Ames eleven-foot transonic wind tunnel are correlated with the corresponding values of theoretical skin friction. Data were obtained over a Mach number range of 0.30 to 0.95 and unit Reynolds numbers of 9.84, 13.1, and 16.4 million per meter. The rms scatter of skin friction coefficient about the correlation is of the order of one percent, which is comparable to the reported accuracy for calibrations of Preston tubes in incompressible pipe flows. In contrast to previous works on Preston tube/skin friction correlations, which are based on the physical height of the probe's face, this satisfactory correlation for compressible boundary layer flows is achieved by accounting for the effects of a variable 'effective' height of the probe. The coefficients, which appear in the correlation, are dependent on the particular tunnel environment. The general procedure can be used to define correlations for other wind tunnels. Author

A82-40483 † **Sport aircraft (Sportivnye samolety).** S. A. Iakovlev. Moscow, Izdatel'stvo DOSAAF SSSR, 1981. 72 p. In Russian.

The development and character of sport aviation in the Soviet Union are discussed, with attention given to the historical background and the line of Yak light aircraft. Non-Soviet sport aircraft are also considered. Many color drawings of sport aircraft are presented. B.J.

A82-40505 **American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings.** Washington, DC, American Helicopter Society, 1982. 537 p. (For individual items see A82-40506 to A82-40556)

Among the topics discussed are the aerodynamics, structural dynamics, propulsion, design, avionics, product assurance, structures and materials, testing, and acoustics of helicopters. The papers presented cover optimum airloads of rotors in hover and forward flight, the evaluation of vertical drag and ground effect, helicopter vibration reduction by rotor blade modal shaping, the finite element analysis of bearingless rotor blade aeroelasticity, adaptive fuel controls, digital full authority engine controls, helicopter autorotation assist concepts, and the conceptual design of an integrated cockpit. Also presented are papers on the demonstration of radar reflector detection, avionics systems for helicopter integration, the adaptation of pultrusion to the manufacture of helicopter components, composite main rotor blades, optimum structural design, the in-plane shear testing of thin panels, error minimization in ground vibration testing, and the prediction of helicopter rotor discrete frequency noise. O.C.

A82-40506 # **Theory and application of optimum airloads to rotors in hover and forward flight.** R. C. Moffitt and J. R. Bissell (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 1-12. (For individual items see A82-40506 to A82-40556)

A method is derived and applied that predicts optimum lift distribution for rotors in hover and forward flight. A key feature of the method is that it is formulated in terms of a matrix equation that gives a direct solution when wake geometry is fixed. An evaluation of the Theodorsen optimum static propeller theory, conducted with the analysis, indicates that the theory is not rigorous. It is shown that the torque differential term omitted in that analysis is both finite and significant. With this term included, the optimum static propeller wake displacement velocity is not constant. An optimized Black Hawk twist distribution in hover is shown to closely approximate the classic inverse radius pitch distribution predicted by strip momentum theory. The resulting downwash, however, is constant only over the inner 75% of the radius and substantial reductions occur in the tip region. Predicted improvements in Black Hawk forward flight performance with optimized azimuthally varying twist are significant but the associated variable twist is complex. (Author)

A82-40507 # **A new Transonic Airfoil Design Method and its application to helicopter rotor airfoil design.** J. C. Narramore and J. G. Yen (Bell Helicopter Textron, Fort Worth, TX). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 13-23. 28 refs.

A new Transonic Airfoil Design Method has recently been developed which can produce airfoils with desired aerodynamic, dynamic, and geometric characteristics. This new method is based on fundamental principles and utilizes efficient techniques to provide a practical airfoil design tool. Compressibility and shock wave terms are included in the method which evaluates families of velocity distributions and selects the best one which will satisfy the design objectives. This pressure distribution is used as input to a transonic inverse routine which calculates the coordinates of the section that will produce the desired velocity. Using this approach, sections can be produced that will provide desired levels of lift, drag, and pitching moment at the design operating conditions. This technology is applied to the design of an aeroelastically compliant rotor (ACR) by designing airfoils which produce favorable pitching moment and performance at design Mach number and Reynolds number conditions. (Author)

A82-40508 # **Recent advances in rotor technology at Boeing Vertol.** M. A. McVeigh and F. J. McHugh (Boeing Vertol Co., Philadelphia, PA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 24-33.

Results of a wind tunnel test on advanced rotor configurations present an assessment of the benefits of advanced airfoils, tip shape, blade chord, and blade number. A CH-47D model rotor with VR-7/8 airfoils was tested as a reference rotor. The advanced rotors, incorporating recently-developed VR-12/15 high speed airfoils, were tested to 231 knots in the wind tunnel and demonstrated an improvement of 6.0% in figure of merit and 25% in cruise lift-to-effective-drag ratio over a rotor with VR-7/8 airfoils. The advanced airfoils show significant improvements in stall inception limits, flying qualities boundaries and rotor noise. Improved blade tip shapes provide additional benefits in rotor noise and do not reduce the stall inception boundary. (Author)

A82-40509 * # **Evaluation of an asymptotic method for helicopter rotor airloads.** A. R. Vaidyanathan and G. A. Pierce (Georgia Institute of Technology, Atlanta, GA). A82-40510 * # **An evaluation of vertical drag and ground effect using the RSRA rotor balance system.** R. J. Flemming (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) and R. E. Erickson (NASA, Ames Research Center, Moffett Field, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 43-54. 12 refs.

A flight test program utilizing the Rotor Systems Research Aircraft (RSRA) main rotor balance system was conducted to obtain data for the helicopter configuration. The test program is discussed along with the employed data reduction methods, and the results. NASA 740, the RSRA used for the vertical drag test, was in the standard helicopter configuration. The 31-foot radius blades have a linear twist of eight degrees and NACA 0012 airfoil sections. Aspects of instrumentation are considered, taking into account the data recording system, the static calibration facility, and aspects of data calibration and processing. Attention is given to the test procedure, data analysis methods, balance measurements, the ground effect, and vertical drag. It is found that the RSRA rotor balance system is capable of providing high quality performance data. The vertical drag of the RSRA is 4%, compared to 2.9% predicted. G.R.

A82-40511 * # **Effect of tip vanes on the performance and flow field of a rotor in hover.** H. R. Velkoff and T. W. Parker (Ohio State University, Columbus, OH). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 55-64. 7 refs. NASA-sponsored research.

Tests run with a single bladed model rotor with a vane located at the tip of the blade indicated significantly increased performance under certain test conditions. Data reveal that a figure of merit increase of over one third occurred in hover. Flow visualization using smoke revealed that a pair of vortices sprung from the blade tip and the vane tip. The vane tip vortex tended to roll up and over the primary vortex. The vortices in the wake became much less well defined with the tip vane configurations. (Author)

A82-40512 # **An experimental investigation of a bearingless model rotor in hover.** S. Dawson (U.S. Army, Aeromechanics Laboratory, Moffett Field, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 65-79. 6 refs.

A 1.79-m diameter model rotor was used to investigate the aeroelastic stability of an isolated bearingless rotor blade in hover, and the results were compared with theory. Configurations tested included (1) an uncoupled configuration with a leading and trailing edge pitch link; (2) a cantilever pitch arm configuration with a single pitch link on the trailing edge of the blade (three pitch link radial locations were studied); (3) a cantilever pitch arm configuration with a single trailing edge pitch link (again three radial locations were studied); (4) a trailing edge pitch link location with -2.5 deg droop; and (5) a trailing edge pitch link location with 2.5 deg precone. Lead-lag damping was heavily dependent on pitch link radial location at higher pitch angles for the cantilever pitch arm configurations studied. Theoretical predictions show stability trends quite well in almost all cases but show discernible differences in damping at higher pitch angles. (Author)

A82-40513 # **Whirl mode stability of the main rotor of the YAH-64 Advanced Attack Helicopter.** L. J. Silverthorn (Hughes Helicopters, Inc., Culver City, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 80-89.

The selection of the main rotor configuration for the YAH-64 helicopter was based on the very favorable experience with the combat-proven rotor system of the OH-6A Light Observation Helicopter. Results of an analysis conducted to investigate the main rotor cyclic modes have shown an instability at the advancing whirl mode frequency of 15 hertz. The whirl mode instability was eliminated in connection with design changes. It is pointed out that the whirl mode instability is an aeroelastic phenomenon strongly dependent on coupling between hub motion and blade pitch change motion. Rotor support structure stiffening proved to be effective in increasing whirl model stability boundaries. G.R.

A82-40514 # **Helicopter vibration reduction by rotor blade modal shaping.** R. B. Taylor (United Technologies Research Center, East Hartford, CT). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 90-101.

The general vibration design criteria currently used in helicopter rotor blade design is placement of natural frequencies removed from integer frequencies of rotor rotation. In this paper, a theoretical approach is presented which demonstrates that design consideration of blade mode shapes can be as important as consideration of natural frequencies for vibration transmitted to the helicopter fuselage. A Modal Shaping Parameter is derived from the theoretical approach that is a measure of blade modal vibration susceptibility. A baseline blade design is then revised in accordance with minimizing the value of the Modal Shaping Parameter. A comparison of hub vibration predicted by a fully coupled aeroelastic analysis for the baseline and revised blade design shows a 70 percent reduction in the contribution of the flatwise modes to vertical hub vibration as well as a 20-30 percent reduction in blade fatigue loading. It is demonstrated that the large reductions in vibration resulted directly from desensitizing certain blade modes to aerodynamic loading as predicted by the modal shaping approach. (Author)

A82-40515 # Correlation of predicted vibrations and test data for a wind tunnel helicopter model. R. Sopher and S. B. R. Kottapalli (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 102-113. 9 refs.

The desirability to reduce helicopter vibrations has motivated the development of a substructure vibration analysis. The computer program involved is designed to serve as a predictive and design tool for designing helicopters for low vibrations. The substructure analysis, (SIMVIB - Simplified Vibration Analysis) embodies features which are necessary for vibration prediction. Little is known about the validity and sensitivity of the conducted analysis. A description is presented of the results of a limited correlation study performed at model scale to examine the method. The correlations of fuselage vibrations and blade moments are presented and discussed. Sensitivities of analytical predictions to changes in dynamic properties of the fuselage are shown. In addition, a study is conducted of the correlation of analysis and theory when higher harmonic control is applied to the rotor to minimize fuselage vibrations. G.R.

A82-40516 # Wind tunnel modeling of rotor vibratory loads. R. Gabel, M. Sheffler, F. Tarzanin, and D. Hodder (Boeing Vertol Co., Philadelphia, PA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 114-124.

A tandem rotor dynamic model has been designed, manufactured and tested at the Boeing Vertol 20 x 20 ft. V/STOL Wind Tunnel. The model measures vibratory hub loads with five independent measuring systems on each rotor. This four-bladed model was flown at full scale tip speeds through a wide envelope of airspeeds and thrusts, achieving a maximum speed of 200 knots. The various measurement systems are discussed, calibration activities are reviewed and test results are presented. (Author)

A82-40517 * # Finite element analysis for bearingless rotor blade aeroelasticity. N. T. Sivaneri and I. Chopra (NASA; Stanford Joint Institute for Aeronautics and Acoustics, Stanford, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 125-139. 18 refs. Grant No. NCC2-13.

A conventional articulated rotor blade has mechanical flap and lag hinges, a lag damper, and a pitch bearing. In connection with an interest in designs of greater mechanical simplicity and increased maintainability, hingeless and bearingless rotors have been developed. A hingeless blade lacks the hinges and is cantilevered at the hub. It does have a pitch bearing for pitch control. A bearingless design eliminates the hinges and the pitch bearing as well. In the present investigation of bearingless rotor blade characteristics, finite element analysis has been successfully applied to determine the solutions of the nonlinear trim equations and the linearized flutter equations of multiple-load-path blades. The employed formulation is based on Hamilton's principle. The spatial dependence of the equations of motion is discretized by dividing the flexbeams, the torque tube, and the outboard into a number of elements. G.R.

A82-40518 * # Civil helicopter propulsion system reliability and engine monitoring technology assessments. J. A. Murphy (Bell Helicopter Textron, Fort Worth, TX) and J. Zuk (NASA, Ames Research Center, Moffett Field, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 140-149. 16 refs. NASA-supported research.

A study to reduce operating costs of helicopters, particularly directed at the maintenance of the propulsion subsystem, is presented. The tasks of the study consisted of problem definition refinement, technology solutions, diagnostic system concepts, and emergency power augmentation. Quantifiable benefits (reduced fuel consumption, on-condition engine maintenance, extended drive system overhaul periods, and longer oil change intervals) would increase the initial cost by $43,000, but the benefit of $24.46 per hour would result in breakeven at 1758 hours. Other benefits not capable of being quantified but perhaps more important include improved aircraft availability due to reduced maintenance time, potential for increased operating limits due to continuous automatic monitoring of gages, and less time and fuel required to make engine power checks. The most important improvement is the on-condition maintenance program, which will require the development of algorithms, equipment, and procedures compatible with all operating environments. R.K.R.

A82-40519 # Adaptive fuel control feasibility investigation. R. L. Bolton (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 150-155.

Responsive, stable power control has been an important design objective since the advent of the helicopter. Many helicopters flying today, however, suffer from less than desirable power response because of the difficulty in designing a system which is rapid in rotor speed control over the entire operating envelope. An optimization regarding the response of engine power for all flight regimes would be particularly important in the case of a combat helicopter. A description is presented of an on-going program of investigation of adaptive fuel control concepts utilizing existing full authority electronic systems capability. The concepts developed in this program are being analyzed by use of a full dynamic computer simulation of the engine/fuel control/airframe. It was found that fuel consumption can be reduced as much as 10% by variation of rotor speed for very specific cruise conditions, i.e., high speed, high altitude, and heavy load. G.R.

A82-40520 # 800 Shaft Horsepower Advanced Technology Demonstrator Engine (ATDE) status update. D. B. Cale (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 156-162.

The objectives, engine design features, accomplishments and current status of the ATDE program are presented. More than 1000 hours of engine and gas generator testing have been accumulated, including performance, environmental and durability testing, and objectives are being demonstrated and problems discovered. More than 1500 hours of aerodynamic component testing and 4000 hours of fuel system and mechanical component testing have also been done. In particular, the durability demonstration was considered successful, but certain redesign efforts, such as inlet separator performance and producibility, compressor durability, and bearing durability, are necessary and are being considered. R.K.R.

A82-40521 * # TF34 Convertible Engine System Technology Program. K. L. Abdalla (NASA, Lewis Research Center, Cleveland, OH) and A. Brooks (General Electric Co., Lynn, MA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 163-165. 8 refs.

The ability of the helicopter to function efficiently at zero flight speed is counterbalanced by a limitation to rather low forward flight speeds. An ability to fly efficiently at high speed would provide very significant improvements in rotorcraft productivity and economics. The implementation of such improvements would require the development of a suitable integrated power plant for both the vertical and horizontal flight modes. The engine should be a shaft output engine in the vertical flight mode. In the horizontal mode, the propulsor can be fan or propeller. A description is presented of a program concerned with the demonstration of a convertible turbofan/turboshaft engine. The program is nominally directed toward the demonstration of a propulsion system for an X-wing aircraft. However, the principles being investigated are applicable to any convertible turbofan/turboshaft engine application. At the current early stage of the program, no barrier problems have become apparent, and interesting possibilities for high speed rotorcraft flight are envisaged. G.R.

A82-40522 # Digital full authority controls for helicopter engines. E. S. Eccles (Dowty and Smiths Industries Controls, Ltd., Cheltenham, Glos., England). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 170-180. 5 refs. Research supported by the Ministry of Defence /Procurement Executive/.

The paper reviews the benefits that accrue to the aircraft, the operator and the crew from using full authority digital electronic engine controls. They are discussed as performance benefits, mission effectiveness benefits, cost benefits and maintainability benefits. The paper discusses the use of redundancy and its effects on the operation of aircraft, particularly commercial operation. The paper concludes that digital controls, and particularly dual redundant controls offer some very significant cost benefits to many helicopter operators. (Author)

A82-40523 # Tandem rotor helicopter characteristics in a continuous icing environment. P. J. Dunford (Boeing Vertol Co., Philadelphia, PA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 181-193. 9 refs.

nozzle exhaust, a single stage, wide chord clapperless fan, and three-dimensional core compressor and core turbine designs. Attention is given to the basic research conducted on component efficiency, which involved the use of laser holography and laser anemometry techniques for observing and measuring aerodynamic flow. O.C.

A82-40965 # Turboprop design - Now and the future. B. S. Gatzen (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 879-903. 92 refs.

After an account of the development history of turboprop rotor technology during the 1960s for V/STOL applications, the development status and design and performance characteristics of commuter aircraft turboprop and high speed propeller fan rotor technologies are considered. The commuter aircraft propeller family incorporates composite shell and aluminum spar blades with a double-acting pitch change system and a pitch-lock feature, resulting in weight reduction, greater safety, improved durability, and a near-ideal aerodynamic performance in the Mach 0.4-0.65 range that assures low cabin noise levels and meets far field noise certification requirements. The propeller fan incorporates 8-10 blades with swept blade tips for the Mach 0.65-0.8 range cruise speeds of 80-160 passenger transports and military cargo and ASW aircraft. The propeller fan will result in fuel consumption reductions of 20% and 40% for commercial and military aircraft, respectively. O.C.

A82-40966 # Inflated wings. A. Roselli. In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 904-910.

The design principles and possible uses of both statically and dynamically inflated wings are considered, on the basis of their inherently high strength/weight ratios, economy of construction, and ease of storage and deployment. It is noted that the upper surface of a large statically inflated wing acts as a greenhouse-effect solar trap which may be harnessed to provide both static buoyancy, as in a hot air balloon, and energy for propulsion. Attractive uses of these large, kite-like wings include auxiliary power for ships, seed, fertilizer and insecticide-spraying platforms for agriculture, and military parachutes. O.C.

A82-40967 # Design and tests of airfoils for sailplanes with an application to the ASW-19B. L. M. M. Boermans and H. J. W. Selen (Delft, Technische Hogeschool, Delft, Netherlands). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 911-921. 14 refs.

The paper describes the considerations, tests and results of an investigation aimed at designing some improved airfoils for sailplane applications. The following preliminary studies are discussed. Windtunnel experiments on two actual wing segments of a Standard Class sailplane ASW-19B are described. The characteristics of some modern airfoils for sailplanes are analyzed. Results of flight and windtunnel experiments with respect to leading edge contamination by insects are presented. The effectiveness of pneumatic turbulators, applied to decrease the airfoil drag by avoiding laminar separation bubbles, is demonstrated. Based on the experience gained in these studies, some airfoils were designed and, after windtunnel verification, applied to the wing of an ASW-19B. Flight performance measurements before and after the wing modification showed an improvement of 5% in glide ratio over the entire practical flight speed range. (Author)

A82-40968 # Variable geometry aerofoils as applied to the Beatty B-5 and B-6 sailplanes. R. A. Streather (Atlas Aircraft Corp., Johannesburg, Republic of South Africa). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 922-930. 11 refs.

Two variable-geometry aerofoils using flexible surfaces have been developed by Beatty for his B-5 and B-6 sailplanes. The B-5 has a basic Eppler 1001 section with a flexible upper surface which is raised to form a thick, high-camber profile for thermalling. The B-6 uses a Wortman FX 05-H-126 section with flexible upper and lower surfaces over the rear 40% of the chord. Predictions for the polars of the two sections using the Eppler and NASA viscous, two-dimensional computer programs are presented. Predictions for the overall aircraft polars are compared with flight-test measurements obtained by conventional methods and by using a prototype glide-angle indicator. (Author)

A82-40969 # Development of the Circulation Control Wing-Upper Surface Blowing powered-lift system for STOL aircraft. M. J. Harris, J. H. Nichols, Jr., R. J. Englar, and G. G. Huson (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 931-939. 10 refs.

The design characteristics and performance levels attained in static, wind tunnel and test aircraft operation of the Circulation Control Wing/Upper Surface Blowing (CCW/USB) powered lift system for STOL aircraft are described. The configuration of the system places turbofan engine exhausts above the upper surface of a Coanda-effect trailing edge circulation-control wing, so that the exhaust gases scrub the wing upper surface. In addition to controlling effective wing camber with circulation control blowing, propulsion-induced lift is generated through the downward deflection of turbofan exhaust over the trailing edge of the wing to a degree which is controlled pneumatically by the momentum of the circulation-control jet sheet. It is experimentally demonstrated that the mechanically simple CCW/USB pneumatic system can generate high lift as effectively as the heavier and more complex mechanical flap systems. O.C.

A82-40970 # Ejector powered propulsion and high lift subsonic wing. R. A. Squyers, J. L. Porter (Vought Advanced Technology Center, Dallas, TX), K. S. Nagaraja (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH), and G. F. Cudahy (Fairchild Republic Co., Farmingdale, NY). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 940-950. 8 refs. Contract No. F33615-79-C-3017.

A high performance ejector wing is designed by means of methodologies based on three-dimensional vortex lattice and lifting line theories and two-dimensional analog techniques, in conjunction with viscous flow predictions and empirically based ejector augmentor design and performance procedures. The initial analytical consideration of various ejector wing configurations established the superior lift and thrust performance at high angles of attack of a configuration consisting of a constant pressure mixing ejector with a wing lower surface inlet and an upper wing trailing edge exhaust flow. Test results for a swept planform, four-ejector bay wing configuration indicate maximum lift/drag ratio improvements over a conventional wing of up to 27%, and an angle of attack increase of more than 10 deg without stall. A thrust augmentation factor of 1.06 was achieved at a freestream Mach number of 0.294, in keeping with predictions. O.C.

A82-40971 # Development of an advanced no-moving-parts high-lift airfoil. R. J. Englar (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 951-959. 15 refs.

An advanced Circulation Control Wing (CCW) airfoil has been developed by incorporating a very small radius blown trailing edge into the aft profile of an existing supercritical airfoil. This combined no-moving-parts configuration generates the same high lift as the already flight-proven large-radius CCW airfoils (section lift coefficient near 7), yet produces negligible unblown drag penalty due to leaving the device deployed for cruise flight. The large leading edge radius of the supercritical airfoil allows high-lift operation without mechanical deflection. Experimental results presented by the paper imply the feasibility of an efficient mono-element cruise and high-lift airfoil, with transition between the two modes accomplished by merely initiating blowing from the fixed trailing edge slot. Comparisons to existing blown and unblown high lift systems are made, and possible applications are discussed. (Author)

A82-40972 # Design integration of CCW/USB for a sea-based aircraft. H. S. D. Yang (Lockheed-California Co., Burbank, CA) and J. H. Nichols, Jr. (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 960-968. 8 refs.

A design study is being conducted to apply the technologies of Circulation Control Wing with Upper Surface Blowing (CCW/USB) engine installation to a Navy/Lockheed sea based aircraft. Research and development in the CCW and USB concepts indicate that the application of the combined technologies may achieve a goal of operating the S-3 type aircraft from a ship deck without the catapult. The design emphasizes the integration of the propulsion system with a simple installation to obtain high lift or drag when required. Attention is also being directed to the cruise efficiency and the optimum design approach for stability and control. (Author)

A82-40973 # Aircraft design for fuel efficiency. L. O. Lehman, D. Woll, and C. Lampart (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 969-979. 6 refs.

U.S. Navy Aircraft Energy Conservation Research, Development, Test and

Evaluation Program recommendations to date are presented, with emphasis on those aircraft design approaches which promise the greatest fuel savings for a given level of investment. In addition to design modifications which reduce aerodynamic drag or aircraft weight, attention is given to efficiency-enhancing propulsion system concepts, Flight Performance Advisory/Management Systems which improve mission fuel utilization, and mission planning and training techniques which improve operational effectiveness. The study results cover fighter, attack and patrol aircraft, and includes recommendations for such year 2000 air vehicles as nuclear aircraft and advanced lighter-than-air vehicles. O.C.

A82-40974 * # **Performance characteristics of a buoyant quad-rotor research aircraft.** B. L. Nagabhushan, P. P. Jacobs, C. E. Belknap (Goodyear Aerospace Corp., Defense Systems Div., Akron, OH), and D. A. Euler (Hughes Helicopters, Inc., Commercial Engineering Div., Culver City, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 980-989. Contract No. NAS2-10777.

Performance characteristics of a buoyant, quadrotor research aircraft, which represents a hybrid airship concept for heavy lift application, are described. Ceiling altitude and endurance for hovering at typical power levels, including partial power failure, are predicted. Climb performance at various altitude and gross weight conditions have been examined. Forward flight performance of this vehicle is illustrated in terms of typical performance parameters such as maximum speed, maximum range, and endurance, over the full range of its payload capability. Optimum payload weights have been identified which result in maximum range at sea level density altitude and constant endurance at various altitudes, both during hover and cruise flights. (Author)

A82-40975 # **Application of a new hybrid material /ARALL/ in aircraft structures.** J. W. Gunnink, L. B. Vogelesang, and J. Schijve (Delft, Technische Hogeschool, Delft, Netherlands). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 990-1000. 18 refs.

An aircraft structural material produced by the bonding of thin aluminum alloy sheets with an aramid fiber-reinforced adhesive, designated Aramid-Reinforced Aluminum Laminate (ARALL), is described. ARALL exhibits superior fatigue crack growth properties, and has a high tensile strength which may be maximized through the introduction of suitable residual stresses into laminates having optimized aluminum sheet thicknesses. Monolithic material test results are used as reference in comparative tensile strength and fatigue tests for notched and centrally cracked ARALL specimens, bolted and riveted joints, and lugs. Buckling test results are compared with calculations for both aluminum alloy and ARALL compression panels. Attention is given to the weight savings obtainable in pressurized cabins representative of various existing aircraft through the use of ARALL. O.C.

A82-40976 # **The behavior of composite thin-walled structures in dynamic buckling under impact.** J. Ari-Gur, J. Singer (Technion-Israel Institute of Technology, Haifa, Israel), and H. Röhrle (Dornier GmbH, Friedrichshafen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1001-1010. 12 refs.

The influence of material properties, and in particular those of composites, on response and behavior of columns under axial impact is studied. An extensive experimental investigation has been carried out on specimens made of graphite/epoxy, glass/epoxy and Kevlar/epoxy laminates with different layups. Dynamic buckling and failure are compared with those of metal columns and the relative advantages and disadvantages of the composite materials are discussed. In general, composite columns show improved dynamic buckling properties, and, with several exceptions, they may replace metal ones efficiently and reliably. (Author)

A82-40977 # **Nondestructive testing in aircraft construction using holographic methods.** K. Wanders (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Cologne, West Germany) and H. Steinbichler (Laboratory Dr. H. Steinbichler, Endorf, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1011-1017. 10 refs.

The application of high power laser-based holographic interferometry to aircraft structure nondestructive testing is described. The techniques covered include real time holography, which denotes structural deformation through the dark bands of destructive interference, the double exposure method, in which structural stresses applied between exposures are manifested as interference fringes among odd multiples of one-half wavelength, and time-average holography, which reconstructs wavefront interference between two virtual images of a vibrating structure. The concrete examples given are of a glass fiber-reinforced plastic tube, a helicopter rotor blade, the running surface of a tire, a turbine rotor, and a thermally deformed antenna, as well as exhaust nozzle jets. O.C.

A82-40978 # **Design and fabrication of cocured composite hat-stiffened panels.** G. D. Peddie and E. E. Spier (General Dynamics Corp., Convair Div., San Diego, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1018-1031. 7 refs.

Design/analysis study established cocured graphite-epoxy hat-stiffened panels of high compressive structural integrity for development and demonstration by mechanized methods. Both flat and curved-crown hats were involved in the design/analysis study, but only the flat-crown concept was included in the manufacturing study. It was found that manufacture of the curved-crown hat would not result in added complexity. Post-buckling structural integrity was assumed to be directly related to the summation of classical local bifurcation buckling strengths of panel elements. Parts were built in stages with the final panel being 18 feet long. Mechanization and tooling procedures were proven to be valid for the manufacturyof long panels. Test panels were not fabricated in time for correlation with analysis, but testing will be performed in the near future. (Author)

A82-40979 # **Spin behaviour of the Pilatus PC-7 Turbo Trainer.** P. Wittwer and O. Masefield (Pilatus Flugzeugwerke AG, Stans, Switzerland). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1032-1039.

Experience gained during the development of the PC-7 Turbo Trainer aircraft suggests that while spin tunnel tests are helpful in determining the critical points of a design's spin characteristics, an exhaustive and accurate forecast of spin behavior is not attainable. The spin tunnel test model used for the PC-7 had a generally steeper nose-down attitude, and was faster turning, than the prototype aircraft. Recovery turns were, however, accurately represented. Attention is given to the differences in spin behavior resulting from a series of modifications to the prototype aircraft in the course of its spin test program. O.C.

A82-40982 # **Models for the motor state of VSCF aircraft electrical power system.** X. Qiu, Y. Yan, and Y. Hu (Nanjing Aeronautical Institute, Nanjing, People's Republic of China). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1061-1071.

Mathematical models for the motor state of an AC-AC variable speed constant frequency (VSCF) power system are established in this paper. Two computing methods, of which the first is a method for finding the analytic solution of the state transition matrix with a computer and the second is a combination of the 0.618-optimization method and the Runge-Kutta method, are proposed. These methods reduce computation time. (Author)

A82-40983 # **The effect of intake flow disturbances on APU compressor blade high cycle fatigue in the Airbus A300.** K. W. Lotter and J. Jörg (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1072-1081. 7 refs.

Premature compressor failures of the APU in the Airbus A300, related to high cycle fatigue, led to a detailed investigation of the relevant intake/engine parameters. Relatively high total pressure distortion and excessive flow angularity have been determined to be the cause of high alternating blade loads and, in combination with the chosen material of the compressor disk and blades, surface fretting. In systematic test steps intake modifications were developed to improve the intake flow quality. It is shown that only relatively minor intake modifications were required to achieve a substantial improvement in total pressure distortion and swirl. In addition, a suitable modification at the compressor blade dove-tails was initiated to increase the blades' fatigue strength. (Author)

A82-40984 # **Engine controls for the 1980s and 1990s.** V. A. Fisher (Rolls-Royce, Ltd., Bristol, England). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1082-1087.

After a brief developmental history of full-authority electronic engine control systems, with attention to that employed by the Olympus 593 engines of the Concorde SST, consideration is given to the developmental prospects for such systems in the near future in view of the increasing power of microprocessors.

ENGINE RUNNING CLEARANCES AND PERFORMANCE DETERIORATION; BCAC NAIL/P AND WA JT9D ENGINE DIAGNOSTICS PROGRAMS
W. J. Olsson and R. L. Martin 19 Feb. 1982 74 p refs
Prepared in cooperation with Boeing Commercial Airplane Co., Seattle
(Contracts NAS3-20632; NAS1-15325)
(NASA-CR-165573; NAS 1.26:165573; PWA-5512-88) Avail: NTIS HC A04/MF A01 CSCL 21E

Flight loads on the 747 propulsion system and resulting JT9D blade to outer airseal running clearances during representative acceptance flight and revenue flight sequences were measured. The resulting rub induced clearance changes, and engine performance changes were then analyzed to validate and refine the JT9D-7A short term performance deterioration model.

CF6 JET ENGINE PERFORMANCE IMPROVEMENT: HIGH PRESSURE TURBINE ACTIVE CLEARANCE CONTROL
S. E. Rich and W. A. Fasching Jun. 1982 136 p refs
(Contract NAS3-20629)
(NASA-CR-165556; NAS 1.26:165556; R82AEB198) Avail: NTIS HC A07/MF A01 CSCL 21E

An active clearance control system was developed which reduces fuel consumption and performance degradation. This system utilizes compressor discharge air during takeoff and fan discharge air during cruise to impinge on the shroud structure to improve the thermal response. The system was evaluated in component and engine tests. The test results demonstrated a performance improvement of 0.7 percent in cruise SFC. S.L.

ANALYTICAL AND SIMULATOR STUDY OF ADVANCED TRANSPORT Final Report
William H. Levison and William W. Rickard (Douglas Aircraft Co., Long Beach, Calif.) Washington NASA Jun. 1982 86 p refs
(Contract NAS1-16410)
(NASA-CR-3572; NAS 1.26:3572; Rept-4778) Avail: NTIS HC A05/MF A01 CSCL 01C

An analytic methodology, based on the optimal-control pilot model, was demonstrated for assessing longitudinal-axis handling qualities of transport aircraft in final approach. Calibration of the methodology is largely in terms of closed-loop performance requirements, rather than specific vehicle response characteristics, and is based on a combination of published criteria, pilot preferences, physical limitations, and engineering judgment. Six longitudinal-axis approach configurations were studied covering a range of handling qualities problems, including the presence of flexible aircraft modes. The analytical procedure was used to obtain predictions of Cooper-Harper ratings, a solar quadratic performance index, and rms excursions of important system variables.

METHODOLOGY FOR DETERMINING ELEVON DEFLECTIONS TO TRIM AND MANEUVER THE DAST VEHICLE WITH NEGATIVE STATIC MARGIN
Boyd Perry, III May 1982 50 p refs
(NASA-TM-84499; NAS 1.15:84499) Avail: NTIS HC A03/MF A01 CSCL 01C

The relationships between elevon deflection and static margin using elements from static and dynamic stability and control and from classical control theory are emphasized. Expressions are derived and presented for calculating elevon deflections required to trim the vehicle in 1g straight-and-level flight and to perform specified longitudinal and lateral maneuvers. Applications of this methodology are made at several flight conditions for the ARW-2 wing. On the basis of these applications, it appears possible to trim and maneuver the vehicle with the existing elevons at -15% static margin.

MANUAL REVERSION FLIGHT CONTROL SYSTEM FOR A-10 AIRCRAFT: PILOT PERFORMANCE AND SIMULATOR CUE EFFECTS Final Report
Thomas H. Gray Mar. 1982 31 p refs
(AF Proj. 1123)
(AD-A113463; AFHRL-TR-81-53) Avail: NTIS HC A03/MF A01 CSCL 14/2

The A-10 aircraft incorporates an emergency backup control mode, the Manual Reversion Flight Control System (MRFCS). Maintaining effective control in this mode is a demanding pilot task, but it is not practiced in the flying training syllabus. Because current plans call for training this skill using simulation, information was needed on simulator cue requirements. Accordingly, the research objective was to determine the effectiveness of selected simulator visual and force cues used by experienced A-10 pilots to maintain aircraft control and to land when in the MRFCS mode. The study found that (1) a large field of view enhanced the pilot's control of the aircraft; (2) platform motion had no influence upon aircraft control; (3) aircraft control was more difficult in the MRFCS mode than in the simple single engine failure state; (4) point of failure was a significant variable reliably affecting pilot control of the aircraft; and (5) pilot performance improved as a function of practice (trials).

THE DETERMINATION OF GUST LOADS ON NONLINEAR AIRCRAFT USING A POWER SPECTRAL DENSITY APPROACH
R. Noback and C. Lasuboder 17 Dec. 1980 80 p refs
(Contract NIVR-RB-1854)
(NLR-TR-80123-U) Avail: NTIS HC A05/MF A01

Since the power spectral density method cannot determine the exceedance of the output over the input in the nonlinear equations which describe an aircraft subjected to atmospheric turbulence, methods which approximate the exceedance curve were developed. One method is analogous to the classical expression for the equivalent gain. Another is analogous to the equivalent gain based on minimum error in energy. In both, the maximum value (mu zy) of the cross correlation function between output and input to the nonlinearity is used. A reasonable estimate of the exceedance curve, for systems for which mu zy is not known, can be obtained if the correlation between the input to the nonlinearity (z) and the system output (y) is high. The ratio of the standard deviations of z and y can then be used. Design loads based on mission analysis can be established once the load exceedance curve due to constant standard deviation of the input is known. A definition for the design load of nonlinear aircraft using the design envelope method is proposed.

OPERATIONAL TEST AND EVALUATION HANDBOOK FOR AIRCREW TRAINING DEVICES. VOLUME 3: OPERATIONAL SUITABILITY EVALUATION Final Report
William V. Hagin, Stephen R. Osborne, Roik L. Hockenberger, James P. Smith, and Thomas H. Gray (Operations Training Div., Williams AFB, Ariz.) AFHRL Brooks AFB, Tex. Feb. 1982 128 p refs
(Contract F33615-78-C-0063; AF Proj. 1123)
(AD-A112569; AFHRL-TR-81-44-Vol-3) Avail: NTIS HC A07/MF A01 CSCL 05/9

The Handbook is comprised of three volumes and is intended to provide guidelines and procedures appropriate for Air Force Operational Test and Evaluation (OT&E) personnel to use in planning, conducting and reporting the results of simulator assessment efforts. Although of value to all test personnel, it is primarily for the typical novice test manager/director - a person who has subject matter expertise (e.g., a qualified pilot or operator), but who may have little or no previous OT&E experience. The Handbook provides detailed coverage on OT&E planning and management with special emphasis on measuring device operational effectiveness and suitability. In accord with its objectives, the Handbook was prepared to serve as a supplement to Air Force Manual 55-43, 'Management of Operational Test and Evaluation,' but providing those specific additional evaluation concepts and techniques mecessary for aircrew training device test and evaluation. ALERT AIRCRAFT ROLL OVER CHOCKS Final Engineering Report
John M. Connolly 14 Aug. 1981 53 p
(AD-A107456; SAC/LGME-ER-P-372) Avail: NTIS
HC A04/MF A01 CSCL 01/5

The feasibility of restraining a parked alert aircraft with chocks which could be safely taxied over was studied. Chocks were designed and then evaluated during SAC Giant Match II exercise. The chocks successfully restrained a parked aircraft and allowed a heavy weight aircraft to safely taxi over when the chocks were placed on a rough surface. Roll-over check use was expanded command wide for B-52G and KC-135 alert aircraft except on icy surfaces. Three ice gripping surface designs were evaluated. All three designs performed successfully. (AD-A113136; NAVTRAEQUIPC-IH-332) Avail: NTIS
HC A04/MF A01 CSCL 05/9

In visual simulation, the distortion of imagery in wide-angle display systems is a major concern. Effective flight training requires that the imagery presented to a trainee provide a proper perspective view of his simulated enyironment without distortion. Use of spherical screens (domes) introduces perspective and geometrical distortion into these wide-angle displays. Use of video projection systems with Computer Image Generation (CIG) offers the options of raster shaping or computer remapping for distortion correction. The method is to correct the imagery before projection in order to provide a non-distorted scene to a trainee. This report is documentation of a computer program for analysis of the required raster correction for specific projector/viewpoint positioning within a spherical screen. The programs and report were initiated to provide input to the F-18 simulator (Device 2E7) being developed by Hughes Aircraft. Author (GRA)

DESIGN BASIS FOR A NEW TRANSONIC WIND TUNNEL
J. B. Willis and N. Pollock Jan. 1982 27 p refs
(AD-A112899; ARL/Aero-TM-335; AR-002-326) Avail: NTIS
HC A03/MF A01 CSCL 14/2

The existing ARL Transonic Wind Tunnel, which is the largest such tunnel in Australia, has severely limited testing capabilities due to a low test Reynolds number and an inadequate test section size. These deficiencies are becoming more acute as military aircraft performance capabilities increase. For current fighter aircraft, the ratio of tunnel test to flight Reynolds number is about 1:100 and the extrapolation of tunnel data to flight carries a high risk of serious error and for some conditions is not possible at all. The small test section size limits the scale of the models which can be tested. The difficulty of machining small models to the required accuracy produces excessive manufacturing times. Moreover, it is not possible to incorporate remotely adjusted control surfaces. These two factors severely restrict tunnel productivity. Given adequate support, it should be possible to build and commission a suitable new wind tunnel in about five years, at a cost substantially less than that of a single military fighter aircraft. CARBON FIBER REINFORCED COMPOSITE STRUCTURES PROTECTED WITH METAL SURFACES AGAINST LIGHTNING STRIKE DAMAGE
C. M. Heckert, H. P. Wentzel (Vereinigte Flugtechnische Werke GmbH), and G. Boes (Tech. Univ., Hanover) 1982 9 p Presented at Intern. Aerospace Conf. on Lightning and Static Elec., Culham, England, 23-25 Mar. 1982
(MBB-UD-340-82-O/E) Avail: Issuing Activity

Lightning protection for carbon fiber reinforced composite (CFC) structures, typical of parts mainly located on the surface of aircraft, was investigated. Only direct structural, effects of a lightning strike on a component were considered. As protective materials, flame sprayed aluminum, aluminum mesh, aluminum foil, and aluminum/glass hybrid fabrics were tested. Three specimen geometries were studied: (1) solid CFC plates 2 and 3 mm thick; (2) sandwich plates with CFC facing of different thickness and with different core material (aluminum and Nomex) 10 mm through; and (3) electrically bonded test specimen composed of a solid CFC plate and metal substructure. The test rig for simulating lightning discharges is described. Results consist of damage diagrams, showing specimen type, applied electrical discharge, and damaged area on protective surface and composite structure. Author (ESA)

C. M. Heckert 1982 17 p In GERMAN Presented at Wehrtech. Symp. Entwicklung der Werkstoffe- u. Fertigungstech. in den naechsten 20 Jahren, Mannheim, West Germany, 17 Dec. 1981; sponsored by Bundesakademie fuer Wehrverwaltung und Wehrtechnik, Mannheim, West Germany
(MBB-UD-341-82-O) Avail: Issuing Activity

The development of reinforced plastics and their application in various manufacturing processes are reviewed. The choice of CFRP or glass fiber reinforced plastic in military and commercial aircraft design is justified by higher specific strength and stiffness properties than alternative metals. Other applications are found in automobiles, railway cars, and helicopters. Size and mass reduction in parts as well as production cost savings are mentioned. Influence on manufacturing of component geometry (rod; plate; complex) is considered. The interrelationship of manufacturing capability with composite materials development is stressed through examples from industry. Author (ESA)

HC A03/MF A01 CSCL 21/4

Preliminary process analyses of three different technically feasible processing schemes proposed by SUN TECH, INC. for converting 100,000 BPCD of raw Paraho shale oil into military turbine fuels was investigated. Each processing scheme is based on very limited, but pertinent, data generated by SUN TECH plus literature sources. The base processing scheme consists of severe hydrotreating followed by sulfuric acid extraction; the two alternate cases utilize moderate hydrotreating plus extraction for nitrogen removal and hydrocracking. Screening-type process designs and costs estimates were prepared for each case using electromagnetic environment is reviewed. All aspects and phases are discussed. A model is chosen for each phase which best describes what is currently known and understood. Computer models for predicting the electromagnetic environment for several of the processes are given, along with numerical predictions. A comprehensive bibliography is also provided. Author

SYSTEM IDENTIFICATION OF NONLINEAR AERODYNAMIC MODELS
T. L. Trankle, J. H. Vincent, and S. N. Franklin *In* AGARD Advan. in the Tech. and Technol. of the Appl. of Nonlinear Filters and Kalman Filters Mar. 1982 26 p refs (For primary document see N82-29989 20-64)
Avail: NTIS HC A23/MF A01

System identification, a technology for determining a mathematical model of a dynamic system from observations of its response to inputs is discussed. Identification technology is used for the determination of nonlinear aerodynamic models for aircraft maneuvering at high angles of attack. The method outlined here (equation error, output error, and maximum likelihood algorithms) can directly nonlinear aerodynamic coefficients in table look-up or multivariable spline formats. For application to nonlinear problems, the basic algorithms are enhanced by recent techniques for evaluation of partial derivatives of the likelihood function, calculation of parameter estimation uncertainties, and by the use of multidimensional splines as a generic model structure. An example application of these methods to the identification of F-4S fighter aircraft high angle of attack aerodynamics is illustrated. B.W.

FORWARD VELOCITY EFFECTS ON FAN NOISE AND THE SUPPRESSION CHARACTERISTICS OF ADVANCED INLETS AS MEASURED IN THE NASA-AMES 40 BY 80 FOOT WIND TUNNEL Final Report
Michael T. Moore May 1980 161 p refs
(Contract NAS2-8675)
(NASA-CR-152328; NAS 1.26:152328; R79AEG626) Avail: NTIS HC A08/MF A01 CSCL 20A

Forward velocity effects on the forward radiated fan noise and on the suppression characteristics of three advanced inlets relative to a baseline cylindrical inlet were measured in the NASA Ames Research Center 40 x 80 foot Wind Tunnel. A modified JT15D turbofan engine in a quiet nacelle was the source of fan noise; the advanced inlets were a Conventional Takeoff/Landing (CTOL) hybrid inlet, a Short Takeoff/Landing (STOL) hybrid inlet, and a treated deflector inlet. Also measured were the static to flight effects on the fan noise of canting the baseline inlet 4 deg downward to simulate typical wing mounted turbofan engines. The CTOL hybrid inlet suppressed the high tip speed fan noise as much as 18 PNdB on a 61 m (200 ft) sideline scaled to a CF6 size engine while the STOL hybrid inlet suppressed the low tip speed fan noise as much as 13 PNdB on a 61 m (200 ft) sideline scaled to a QCSEE size engine. The deflector inlet suppressed the high tip speed fan noise as much as 13 PNdB at 61 m (200 ft) overhead scaled to a CF6 size engine. No significant changes in fan noise suppression for the CTOL and STOL hybrid inlets occurred for forward velocity changes above 21 m/s (68 ft/s) or for angle of attack changes up to 15 deg. However, changes in both forward velocity and angle of attack changed the deflector inlet noise unpredictably due to the asymmetry of the inlet flow field into the fan. Author

WIND TUNNEL STUDIES OF STORE SEPARATION WITH LOAD FACTOR. FREEDROPS AND CAPTIVE TRAJECTORIES c02

J. Coste and J. Leynaert *In its* La Rech. Aerospatiale, Bi-monthly Bull. no. 1982-1, Jan.-Feb. 1982 (ESA-TT-755) May 1982 p 1-9 refs Transl. into ENGLISH from La Rech. Aerospatiale, Bull. Bimestrial (Paris), No. 1982-1, Jan.-Feb. 1982 (For primary document see N82-30260 20-99)
Avail: NTIS HC A02/MF A01; original report in FRENCH available at ONERA, Paris FF 55

Techniques used to study separation trajectories of stores dropped from under an aircraft are described. In dropping tests, light, heavy and intermediate scaling laws which respect the Mach number are studied. The captive trajectory tests use a six degrees of freedom system which moves the model step by step in the aerodynamic field of the aircraft. Aerodynamic forces acting on the store are measured by an internal balance. This method does not take into account the relative speed of store and aircraft. Arrangements used to compensate for this defect are shown. When the stores are inert, have perturbed trajectories, high initial separation speeds, or are incompatible with an external mount and an internal balance, the freedrop method is preferable, particularly for short trajectories. In the contrary cases, or when the store is propelled, the captive trajectory method is essential. For long trajectories, with several phases, the two methods are used in conjunction. Author (ESA)

A82-38995 # Target acquisition system/air-to-surface weapon compatibility analysis. A. R. Mitchell (Analytic Sciences Corp., Reading, MA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 636-642. (AIAA 82-1618)

The paper presents a simple, closed form method which has been developed for compatibility analysis of an autonomous target acquisition system with an air-to-surface weapon. The output is a probability distribution for expected target location at the moment of potential weapon release. Compatibility is measured by the probability that the target lies in the footprint of the released weapon. The method uses statistical input data on terrain masking, atmospheric obscuration, and the acquisition system timeline from first target detection through classification, designation and weapon release. Generic results are presented for a hypothetical target acquisition system. (Author)

A82-38998 # The Shiryayev sequential probability ratio test for redundancy management. J. L. Speyer and J. E. White (Texas, University, Austin, TX). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 658-666. 10 refs. (AIAA 82-1623)

An essential aspect in the design of fault tolerant digital flight control systems is the design of failure detection and redundancy management systems. A decision rule, the Shiryayev sequential probability ratio test (SPRT), is used to detect failures between similar instruments, as well as between dissimilar instruments through analytic redundancy. Unlike the Wald SPRT, which tests for the presence of failure or no failure in all of the data sequence, the Shiryayev SPRT detects the occurrence of a fault in the data sequence in minimum time if certain conditions are met. The performance of the Shiryayev SPRT in detecting a failure between two rate gyros as compared to standard fixed interval schemes is presented, as is the performance for a single accelerometer failure using translational kinematic equations to form a parity relation for analytic redundancy. (Author)

A82-39003 # X-29A flight control system design experiences. J. Chin, H. Berman, and J. Ellinwood (Grumman Aerospace Corp., Bethpage, NY). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 703-713. 11 refs. (AIAA 82-1538)

The X-29A aircraft is a technology demonstrator consisting of a structurally tailored forward swept wing, an automatic camber control concept to increase aerodynamic efficiency, a high level of aircraft relaxed static stability (RSS), and a digital fly-by-wire flight control system using control laws designed via modern optimal control techniques. A description is presented of the considerations exercised during the design and development of the flight control system (FCS), and attention is given to the uniqueness of the X-29A aircraft which led to high levels of RSS for minimum FCS requirements. The advantages of RSS are discussed along with the longitudinal control requirements, the control modes, aspects of control law development, and questions of flight control system validation. G.R.

A82-39009 * # The effects of atmospheric turbulence on a quadrotor heavy lift airship. M. B. Tischler and H. R. Jex (Systems Technology, Inc., Hawthorne, CA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 767-776. 15 refs. Contract No. NAS2-10330. (AIAA 82-1542)

The response of a quadrotor heavy lift airship to atmospheric turbulence is evaluated using a four-point input model. Results show interaction between gust inputs and the characteristic modes of the vehicle's response. Example loop closures demonstrate tradeoffs between response regulation and structural loads. Vehicle responses to a tuned discrete wave front compare favorably with the linear results and illustrate characteristic HLA motion. (Author)

A82-39011 # Analyzing stable pad disturbances and design of a sensor vault to monitor pad stability. O. D. Starkey, J. D. Kerr, and L. D. Hall (Teledyne, Inc., Teledyne Geotech, Garland, TX). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 785-788. (AIAA 82-1585)

Among disturbing environmental mechanisms are tidal variations in gravity, natural and cultural seismic activity, and acoustic excitation of components. An analysis is presented of these disturbances. Also described is the development of a vault that isolates the sensors from external disturbances yet provides close coupling to the test pad. Initial tests carried out on a prototype vault installed in February 1982 show that a feedback-type seismometer can include a sustained oscillation within its housing. A possible analysis of this phenomenon is included. C.R.

A82-39013 # Avoiding the pitfalls in automatic landing control system design. A. A. Lambregts (Boeing Commercial Airplane Co., Seattle, WA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 799-809. (AIAA 82-1599)

This paper relates recent experiences at Boeing with the development and flight testing of improved automatic landing flare control laws for the B-737 and B-747 aircraft. Some earlier designs and their limitations are reviewed. Basic requirements for flare law initiation, command synchronization, feedback signal sources and characteristics, inner loop configurations, elevator control band width and throttle control are discussed. Experiences and potential pitfalls in the development of integrated glide slope and flare control laws for improving an existing B-747-SP design and for a new B-737 SP-177 autopilot are described. Analog computer design constraints are reviewed. A 'variable tau' flare law concept, using groundspeed to reduce longitudinal dispersion and achieve a constant flare height are discussed as well as an 'explicit trajectory' flare control concept to achieve the same goals, along with flight test results. New design options using digital computers are pointed out. (Author)

A82-39016 # Flight control synthesis using robust output observers. E. G. Rynaski (Calspan Advanced Technology Center, Buffalo, NY). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 825-831. (AIAA 82-1575)

A brief investigation is made of the application of robust output observer theory to the design of flight control systems for advanced aircraft configurations. Observer theory is seen as a natural design tool because the resulting observers are in themselves unobservable and do not increase the order of the closed-loop response, thereby more closely satisfying flying qualities requirements. Examples are adduced to show that the observer configuration is not unique in either the observer poles or the output sensors and that many different control system configurations using a variety of sensors can be designed to yield identical closed-loop dynamic behavior. In this way, it becomes possible to incorporate considerable analytic and physical redundancy into nearly any flight control system. C.R.

A82-39081 # Handling qualities criteria for flight path control of V/STOL aircraft. M. B. Tischler and R. H. Hoh (Systems Technology, Inc., Hawthorne, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1292.* 10 p. 14 refs. Contract No. N62269-80-C-0290.

Tentative handling qualities criteria for V/STOL path control have been developed based on a study of bandwidth requirements and lower-order equivalent system representations. This work extends the equivalent system concept from singleloop to multiloop applications. Numerical results show the significant influence of inter-axis coupling on maximum attainable piloted bandwidth. Preliminary fixed-base simulation results verify the expected trends and correlate well with the analytically derived boundaries proposed in this paper. (Author)

A82-39082 * # Piloted simulator evaluation of a relaxed static stability fighter at high angle-of-attack. M. Lapins, R. W. Klein, R. P. Martorella, J. Cangelosi (Grumman Aerospace Corp., Bethpage, NY), and W. R. Neely, Jr. (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1295.* 19 p. 10 refs.

A piloted simulator evaluation of the stability and control characteristics of a relaxed static stability fighter aircraft was conducted using a differential maneuvering simulator. The primary purpose of the simulation was to evaluate the effectiveness of the limiters in preventing departure from controlled flight. The simulation was conducted in two phases, the first consisting of open-loop point stability evaluations over a range of subsonic flight conditions, the second concentrating on closed-loop tracking of a preprogrammed target in low speed, high angle-of-attack air combat maneuvering. The command limiters were effective in preventing departure from controlled flight while permitting competent levels of sustained maneuvering. Parametric variations during the study included the effects of pitch control power and wing-body static margin. Stability and control issues were clearly shown to impact the configuration design. C.D.

A82-39083 # In-Flight investigation of large airplane flying qualities for approach and landing. N. C. Weingarten and C. R. Chalk (Calspan Advanced Technology Center, Buffalo, NY). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1296.* 13 p. 9 refs. Contract No. F33615-79-C-3618.

A study of the handling qualities of large airplanes in the approach and landing Flight Phase was performed utilizing the USAF-AFWAL/Calspan Total In-Flight Simulator. A one-million pound statically unstable airplane model was used as a baseline about which variations were made. The primary variables were relative pilot position with respect to center of rotation, command path time delays and phase shifts, augmentation schemes and levels of augmentation. The results indicate that the approach and landing task with very large airplanes is a fairly low bandwidth task. Low equivalent short-period frequencies and relatively long time delays can be tolerated. As the pilot position is moved aft towards and then behind the center of rotation, pilot ratings are degraded. (Author)

A82-39084 * # **Development and flight test evaluation of a pitch stability augmentation system for a relaxed stability L-1011.** J. J. Rising (Lockheed-California Co., Burbank, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1297.* 10 p. 5 refs. Contract No. NAS1-15326.

The L-1011 has been flight tested to demonstrate the relaxed static stability concept as a means of obtaining significant drag benefits to achieve a more energy efficient transport. Satisfactory handling qualities were maintained with the design of an active control horizontal tail for stability and control augmentation to allow operation of the L-1011 at centers of gravity close to the neutral point. Prior to flight test, a motion base visual flight simulator program was performed to optimize the augmentation system. The system was successfully demonstrated in a test program totaling forty-eight actual flight hours. (Author)

A82-39085 # **Supersonic missile aerodynamic and performance relationships for low observables mission profiles.** R. J. Krieger (McDonnell Douglas Astronautics Co., St. Louis, MO). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1298.* 11 p. 6 refs.

Closed-form analytical relationships are developed between supersonic missile aerodynamic characteristics such as lift, zero-lift drag and drag due-to-lift and performance parameters such as range, velocity, specific range, flight path angle and maneuver load factor. These relationships apply to low observable missile flight profiles for long range cruise and glide missions. The analytical relationships are developed for climb, cruise, glide, dive, and run-in segments. The results include equations for use in closed-form performance estimates and guiding configuration development. (Author)

A82-39090 * # **Applications of parameter estimation in the study of spinning airplanes.** L. W. Taylor, Jr. (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1309.* 7 p. 12 refs.

Spinning airplanes offer challenges to estimating dynamic parameters because of the nonlinear nature of the dynamics. In this paper, parameter estimation techniques are applied to spin flight test data for estimating the error in measuring post-stall angles of attack, deriving Euler angles from angular velocity data, and estimating nonlinear aerodynamic characteristics. The value of the scale factor for post-stall angles of attack agrees closely with that obtained from special wind-tunnel tests. The independently derived Euler angles are seen to be valid in spite of steep pitch angles. Estimates of flight derived nonlinear aerodynamic parameters are evaluate; in terms of the expected fit error. (Author)

A82-39091 * # **Analysis of general-aviation accidents using ATC radar records.** R. C. Wingrove and R. E. Bach, Jr. (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1310.* 8 p. 12 refs.

It is pointed out that general aviation aircraft usually do not carry flight recorders, and in accident investigations the only available data may come from the Air Traffic Control (ATC) records. A description is presented of a technique for deriving time-histories of aircraft motions from ATC radar records. The employed procedure involves a smoothing of the raw radar data. The smoothed results, in combination with other available information (meteorological data and aircraft aerodynamic data) are used to derive the expanded set of motion time-histories. Applications of the considered analytical methods are related to different types of aircraft, such as light piston-props, executive jets, and commuter turboprops, as well as different accident situations, such as takeoff, climb-out, icing, and deep stall. G.R.

A82-39092 * # **An estimation of aerodynamic forces and moments on an airplane model under steady state spin conditions.** B. N. Pamadi and L. W. Taylor, Jr. (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1311.* 14 p. 21 refs.

The problem of estimating the aerodynamic characteristics of a wing body configuration of a spinning airplane at extreme angles of attack and spin rates is approached by the application of strip theory. Semiempirical methods are used to estimate the aerodynamic force distributions over each component using static, nonrotational wind-tunnel test data. To these predictions, corrections are applied to account for the primary rotational flow effects which are significant at large spin rates. The results of this modified strip theory are shown to be in good agreement with spin tunnel rotary balance test data. (Author)

A82-39093 * # **A simple, low cost application of a flight test parameter identification system.** R. Clarke and J. Roskam (Kansas, University, Lawrence, KS). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1312.* 9 p. 9 refs. Grant No. NsG-4019.

The flight test system combines state-of-the-art microprocessor technology and high accuracy instrumentation with parameter identification technology which minimize data and flight time requirements. The system was designed to avoid permanent modifications of the test airplane and allow quick installation. It is capable of longitudinal and lateral-directional stability and control derivative estimation. This paper presents details of this system, calibration and flight test procedures, and the results of the Cessna 172 flight test program. The system has proven easy to install, simple to operate, and capable of accurate estimation of stability and control parameters in the Cessna 172 flight tests. (Author)

A82-39094 # **Parameter estimation applied to general aviation aircraft - A case study.** W. R. Wells (Wright State University, Dayton, OH) and V. Klein (George Washington University, Washington, DC; Joint Institute for Advancement of Flight Sciences, Hampton, VA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1313.* 12 p. 27 refs.

NASA is currently involved in extensive general aviation stall-spin studies. In undertaking the stall-spin research, the aircraft dynamics in pre and post stall regimes must be understood. A case study is presented of the application of parameter estimation methods to problems of general aviation aircraft. The research areas considered are related to control input selection, data compatibility, identification algorithms, unsteady aerodynamic modeling, and model structure determination. Several recent advances in the application of systems identification are summarized using the aircraft as subject. These advances are concerned with such techniques as stepwise regression algorithms, design of optimal control selection for parameter estimation, use of Kalman filtering in data compatibility checks, frequency domain identification algorithms, and high angle of attack formulation. It is shown that the discipline of systems identification can be quite effective in improving the knowledge of the flight mechanics of general aviation aircraft. G.R.

A82-39096 * # **Dynamic load measurements with delta wings undergoing self-induced roll-oscillations.** D. Levin and J. Katz (Technion-Israel Institute of Technology, Haifa, Israel). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1320.* 11 p. 11 refs. Grant No. NAGW-00218.

The aerodynamic forces acting on a delta wing, mounted on a free-to-roll sting-balance apparatus, were measured. Two wing planforms having leading edge sweeps of 76 and 80 deg were tested, but only the wing with the 80 deg sweep would undergo periodic self-induced roll oscillation. The time dependent forces and roll angles for this wing were then recorded for various test conditions. In these tests a considerable drop in the average normal force of the free-to-roll wing was measured, relative to the normal force obtained in the static tests. Also, the helium-bubble flow visualization technique was used to gain some insight into the periodic motion of the separated leading edge vortices. (Author)

A82-39098 * # **High angle-of-attack characteristics of a forward-swept wing fighter configuration.** S. B. Grafton, W. P. Gilbert, M. A. Croom, and D. G. Murri (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1322.* 19 p. 13 refs.

The NASA-Langley Research Center is currently investigating the high angle-of-attack characteristics of a forward-swept wing fighter technology demonstrator in a cooperative program with the Defense Advanced Research Projects Agency. The program includes static and dynamic wind-tunnel force tests, free-flight model tests, spin-tunnel tests, and piloted simulation. Particular emphasis is placed on identifying the contributions of the forward-swept wing to the configuration aerodynamics at high angles of attack. Results are presented to illustrate the wing contributions in terms of aerodynamic stability, flow visualization, and observation of free-flight characteristics. (Author)

A82-39100 # **The use of small strakes to reduce interference drag of a low wing, twin engine airplane.** T. E. Wallis, D. R. Ellis (Cessna Aircraft Co., Wichita, KS), and W. H. Wentz, Jr. (Wichita State University, Wichita, KS). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1323.* 13 p. 5 refs.

This paper discusses the effect of small strakes on the interference drag of a low wing, twin engine airplane. The strakes, highly swept delta wing semi-spans with a root chord 18 percent of the wing MAC, provide a strong streamwise vortex at high angles of attack. They are placed on the fuselage and nacelles at the wing leading edge. Both full scale and wind tunnel tests are discussed. The strakes, in the proper location, provide a reduction in interference drag. Increases in

In connection with the growing need for Instrument Flight Rule (IFR) operations in both military and commercial applications, considerable emphasis has been placed on helicopter utilization in adverse weather conditions. As a corollary to this requirement, investigations have been conducted with the aim to permit the operation of helicopters under icing conditions. Attention is given to test results, a natural icing performance analysis, the need for a deicing system, and icing certification criteria. It is found that the impracticality and expense involved in testing helicopters to the full extent of the requirements of FAR Part 25 makes the need for LIMITED icing releases a real one. Recognition of specific helicopter attributes and shortcomings is highly desirable for this type of certification. G.R.

A82-40524 # **An evaluation of helicopter autorotation assist concepts.** G. T. White (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA), A. H. Logan, and J. D. Graves (Hughes Helicopters, Inc., Culver City, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 194-216. 11 refs. Grant No. DAAK51-80-C-0011.

The unique autorotation capability of the helicopter is an inherent safety feature which is heavily relied upon during power failure emergencies. However, the autorotation maneuver places great demands on pilot skill. An analytical study was conducted of autorotation improvement devices. These devices were evaluated using both weight and preliminary performance analyses. The three most promising concepts were carried through preliminary design. It was found that no significant gain in autorotation performance can be achieved by only the management of available baseline energy. Supplemental energy must be supplied. The use of a simple Autorotative Index is a good tool for the initial determination of the auxiliary power level required for good autorotative characteristics. The autorotative characteristics of a single-engine scout helicopter can be substantially improved with the combination of a MIL-STD-1290 type landing gear and either a Tip Jet, Flywheel or Auxiliary Turbine system. G.R.

A82-40525 # **Predesign study for an advanced flight research rotor.** R. H. Blackwell, T. G. Campbell (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT), and R. B. Taylor (United Technologies Research Center, East Hartford, CT). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 217-234. 11 refs.

A flight research rotor program aimed at demonstrating significant improvements in aerodynamic performance and reductions in vibration and noise is outlined. The benefits and practical design considerations of approximately a dozen advanced rotor concepts were considered and three concepts were chosen for inclusion in the flight research program. Detailed design of a blade permitting experimental study of tip shape, a tuned trailing edge tab system and blade mass distribution is presented. The design issues addressed in connection with the research blade are shown to have general applicability. Finally the total program required to develop these concepts including further analysis, model test, ground tests and flight test is outlined. (Author)

A82-40526 # **Sikorsky ACAP preliminary design.** B. F. Kay (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-4050520-01) Washington, DC, American Helicopter Society, 1982, p. 235-238A.

Sikorsky Aircraft is currently under contract to the U.S. Army to conduct an Advanced Composite Airframe Program (ACAP). The basic objectives of the ACAP are to demonstrate the weight and cost saving potential of advanced composite materials when used to the maximum extent possible in an airframe designed to meet stringent military requirements. This paper will describe Sikorsky's ACAP helicopter and the approaches used to minimize weight, reduce manufacturing costs and achieve high levels of crashworthiness, survivability, reliability, and maintainability. (Author)

A82-40527 # **Conceptual design of the LHX integrated cockpit.** R. R. Pruyn and R. E. Domenic (Boeing Vertol Co., Philadelphia, PA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 239-246. 9 refs.

The present investigation is concerned with the application of computer-based technology to the next generation of Army tactical aircraft. Attention is given to missions which drive cockpit design, the potential benefits of improved displays, developments in automation, questions regarding the merits of displays versus windows, mockups to develop design, aspects of display capability and flight safety, concepts in image processing, crew workload studies, assumptions for workload analysis, workload methodology, and the results of workload analysis. It is concluded that with the anticipated automation, controls, and displays, one crewman can efficiently perform all of the desired tactical scout and attack tasks. For next-generation aircraft a wide-field-of-view panel or helmet-mounted display is needed since it reduces pilot workload and improves mission performance and flight safety. G.R.

A82-40528 # **The YAH-64 empennage and tail rotor - A technical history.** R. W. Prouty and K. B. Amer (Hughes Helicopters, Inc., Culver City, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 247-261.

The development of a helicopter from drawing board to production line is still very much a learning process. The lessons learned in connection with the development of the Army YAH-64 Advanced Attack Helicopter should, therefore, be sufficiently valuable to future designers to warrant a detailed review. Attention is given to the changes to the empennage and tail rotor as the designers sought the best compromise between good performance and flying qualities on the one hand and low weight, low cost, and simplicity on the other. The considered helicopter has been developed primarily as a tank hunter and killer capable of flying and fighting at night or in bad weather. The primary weapons are wingmounted Hellfire guided missiles. The work discussed primarily deals with solutions to problems in the basic aircraft as they were discovered during its flight test. G.R.

A82-40529 # **Future helicopter cockpit design.** S. D. Roy (Westland Helicopters, Ltd., Yeovil, Somerset, England). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 262-273. 5 refs.

The influence of the use of electronic display systems on the helicopter cockpit is examined. Color CRT's are decidedly essential when proposed as complete replacements for conventional instruments, and two sizes of display are being considered (5 inches x 5 inches and 8 inches x 8 inches). Lighter displays, using flat panel technology, should be considered for the long term, but with careful consideration of pilot error due to misselection. Other technologies considered are data entry and extraction techniques, and direct voice control systems. The data technique is considered in terms of class of task, access, time constraints, and space availability, and a design approach for a voice system capable of continuous speech recognition is presented. The cockpit design implications of these modifications are considered. R.K.R.

A82-40530 # **Concept demonstration of automatic subsystem parameter monitoring.** M. S. Randolph (General Electric Co., Aerospace Control Systems Dept., Binghamton, NY) and R. V. Kurowsky (U.S. Army, Fort Monmouth, NY). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 274-286. Grant No. DAAK80-79-C-0270.

A feasibility demonstration model of an Electronic Master Monitor and Advisory Display System (EMMADS) has been developed as part of the Army's efforts to reduce aircrew workload, integrate cockpit instrumentation, and enhance aircraft maintenance capability. The feasibility demonstration hardware is considered along with aspects of system operation, taking into account the philosophy of operation, the types of operation, manually commanded operations, and fault commanded operations. Under a follow on development effort currently in progress, the capabilities of the current feasibility hardware will be expanded to include fault logic for all CH-47D model subsystems. G.R.

A82-40531 * # **Flight test evaluation of a video tracker for enhanced offshore airborne radar approach capability.** G. R. Clary (NASA, Ames Research Center, Moffett Field, CA) and P. G. Cooper (Cooper Avionics, Inc., Montara, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 287-297. 7 refs.

As a part of NASA's Rotorcraft All-Weather Operations Research Program, advanced airborne radar approach (ARA) concepts are being investigated. Since data from previous NASA/FAA flight tests showed significant ARA limitations, a research program was initiated at NASA Ames Research Center to determine the benefit that could be derived by automating certain radar functions and superimposing course display data on the radar display. To evaluate these concepts, a newly developed video tracking system which interfaces with weather radar was acquired. After the pilot designates a destination target, the system tracks the target video as it moves on the radar indicator. Using a small, efficient microprocessor, the autotracker presents valuable approach data on the radar screen and automatically adjusts the radar gain and tilt. Results of a limited flight test evaluation of the autotracker show that the course display concept, combined with automated gain and tilt functions, is effective for improving ARA's and reducing radar operator workload. (Author)

A82-40532 * # **Demonstration of radar reflector detection and ground clutter suppression using airborne weather and mapping radar.** D. J. Anderson, J. S. Bull (NASA, Ames Research Center, Moffett Field, CA), and J. P. Chisholm (Nevada, University, Reno, NV). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 298-305.

A navigation system which utilizes minimum ground-based equipment is especially advantageous to helicopters, which can make off-airport landings. Research has been conducted in the use of weather and mapping radar to detect large radar reflectors overland for navigation purposes. As initial studies have not been successful, investigations were conducted regarding a new concept for the detection of ground-based radar reflectors and eliminating ground clutter, using a device called an echo processor (EP). A description is presented of the problems associated with detecting radar reflectors overland, taking into account the EP concept and the results of ground- and flight-test investigations. The echo processor concept was successfully demonstrated in detecting radar reflectors overland in a high-clutter environment. A radar reflector target size of 55 dBsm was found to be adequate for detection in an urban environment. G.R.

A82-40533 # **Micro-heads-up display.** J. R. Goodman and H. W. Upton (Bell Helicopter Textron, Fort Worth, TX). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 306-311.

A revolutionary microsized heads-up display (micro-HUD), which weighs only a few ounces and can be worn as a pair of conventional eyeglasses, is described. A microsize optical system makes the display possible. An advanced state-of-the-art visible light-emitting diode (VLED) array and a vibrating fiber ribbon generate the image. The system uses a microprocessor display generator that produces a dynamic image with 128 x 128 elements of resolution. This gives the micro-HUD the capability of presenting the same information as a standard heads-up display. Development of the custom-designed linear array of light-emitting diodes along with the specially fabricated fiber-optic scanner is also described. Results of laboratory and flight tests are discussed. Potential improvements such as higher resolution and multicolor versions of the display are described. Finally, the possible applications and future of the system is discussed. (Author)

A82-40534 # **Avionics systems for helicopter integration.** D. R. Nelson (Rockwell International Corp., Collins Government Avionics Div., Cedar Rapids, IA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 312-321.

Attention is given to a 'core system' which provides a common set of equipments that is, with appropriate software, applicable to a wide variety of helicopter missions. The basic core system is the core of the Coast Guard (USCG) HH-65A system. It has been proposed for civil and military helicopter programs with requirements ranging from covert 'behind-the-lines' operations to resupply of oil rigs. Particular elements of the core avionics systems include the Cockpit Management System (CMS), the Multi-purpose Video Display System, the Mission Computer, a dual redundant multiplex data bus control system, and a four-axis autopilot/flight director capable of hands-off flight in all regimes including transition to hover. Attention is given to system capability requirements, aspects of system functional allocation, the automatic flight control system, and the mission processor. G.R.

A82-40536 * # **NASA/FAA Helicopter ATC simulation investigation of RNAV/MLS instrument approaches.** L. L. Peach, Jr., L. Tobias, and H. Q. Lee (NASA, Ames Research Center, Moffett Field, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 322-336. 6 refs.

The NASA/FAA Helicopter Air Traffic Control (ATC) simulation investigations to determine the feasibility of simultaneous, independent instrument approach procedures for helicopters at major terminal areas, using Area Navigation/Microwave Landing System (RNAV/MLS) guidance, was conducted at several levels of helicopter display sophistication, up to that of a Cockpit Display of Traffic Information (CDTI) system. Test objectives included the determination of pilot acceptability and the tracking performance of the RNAV/MLS's noninterfering rotorcraft approach path structure, along with the evaluation of the effect on controller workload of multiroute structures combining conventional and rotorcraft approaches at various arrival rates and traffic separations. The utility of electronic area maps and CDTI displays was also investigated. Participating pilots flew 127 simulated instrument approaches in an ATC simulation laboratory. O.C.

A82-40537 # **Adaptation of pultrusion to the manufacture of helicopter components.** E. E. Blake (Bell Helicopter Textron, Fort Worth, TX) and N. J. Tessier (U.S. Army, Army Materials and Mechanics Research Center, Watertown, MA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 346-351.

A fabrication technique is described in which pultruded epoxy/glass stock with a complex crossection is postformed and cured to produce a curved UH-1 helicopter door track. During pultrusion, prepreg roving is overwrapped with adhesive prepreg glass cloth for transverse strength. The 'B' stage stock is postformed and autoclave cured in a glass/epoxy tool. The resulting door track retains the crossection of the pultrusion after developing the sweep and twist designed into the present aluminum part. Wear and load testing were performed on the composite door track along with an economic analysis comparing it with hand layup and the present aluminum track. The results demonstrate that it is feasible to produce complex helicopter components from pultrusions by means of postforming. (Author)

A82-40538 # **In-motion radiography of titanium spar tube welds.** R. J. Milne (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 352-358.

The application of titanium to a helicopter rotor blade spar was developed during the 1960's. However, the initially contemplated manufacturing method did not prove to be economical, and a new manufacturing procedure involving the use of a plasma arc welding technique was developed. The verification of weld integrity by means of a typical static X-ray test was found to be too time consuming, and the employment of in-motion radiography was considered. By using an in-motion radiographic system, it was possible to reduce significantly the time required to radiograph spar tube welds without sacrificing detail sensitivity. G.R.

A82-40539 # **Development of the Sea King composite main rotor blade.** R. Sanders (Westland Helicopters, Ltd., Yeovil, Somerset, England). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 359-370.

The Sea King composite main rotor blade has been designed to satisfy ruggedness requirements for the 1980's, and will soon be ready for flight testing. Composite materials with a replacable metal erosion shield have been chosen to improve the life of the blade, and a carbon and glass fiber mixture satisfies stiffness and weight requirements. A bolted root end design was chosen for this retrofit blade in order to ease automation, without degrading fatigue advantages of the composite construction. Technical problems and achievements encountered in the development process are discussed in terms of materials used, blade root design, manufacturing process, serviceability, and quality and safety control. A plant has been constructed to satisfy future production requirements, with an anticipated product availability date of late 1984. R.K.R.

A82-40540 # **Computer aided coordinate measuring systems.** J. W. Nastri (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 371-376.

Sikorsky's computer-aided inspection system and equipment utilized to assure that manufactured parts meet drawing tolerance specifications are discussed. An overview of the system is given, and the software is described, including the monitor console routine and commands and the language commands. The system's three coordinate measuring machines are discussed, and the part inspection methods are described in stepwise fashion. System benefits and time savings items are detailed, including quick and accurate measurement of parts difficult to inspect by conventional methods, significant reduction in inspection time, a consistent baseline that highlights variances, and the use of personnel with lower skill levels to effectively inspect critical parts. C.D.

A82-40541 # **Support of the HH-65A - The impact of advanced technology of VTOL systems upon existing product support.** R. E. Walkup (Aerospatiale Helicopter Corp., Grand Prairie, TX). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 377-382.

The Coast Guard (USCG) will begin to replace the HH-52 Helicopters with the HH-65A in 1982. The HH-65A is equipped with a state-of-the-art digital avionics system. As the HH-52 has only vacuum tube avionics equipment, the new establishment of a complete support capability for solid state digital avionics will be necessary in connection with the introduction of the HH-65A. Other technological advances utilized in the HH-65A are related to turbine engines of modular design and the employment of composite materials in the aircraft structure. The HH-52 will continue in operation until all USCG stations will have received their HH-65A's. To provide support for simultaneous operation of both helicopters without an increase in support personnel will necessitate careful planning during the transitional period. Attention is given to the HH-65A avionics system, modular engine maintenance, aspects of corrosion control and the USCG mission, and the allocation and repair of spare components. G.R.

A82-40542 # **A roadmap toward a fatigue qualification process for modern technology helicopters.** S. T.-T. Chiu and R. W. Arden (U.S. Army, Directorate for Development and Qualification, St. Louis, MO). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 383-387. 30 refs.

The helicopter fatigue qualification process is critically reviewed to establish a roadmap, providing specific directions for a more efficient and unified qualification process. Specific improvements, various alternatives, and suggested unified approaches are discussed in terms of supporting rationales in the areas of coupon

The fault tolerance characteristics, transducer systems, high integrity software and reliability/maintainability of the projected full authority digital electronic control (FADEC) system are described, with attention to fault identification and flight crew notification procedures. The RB211-535C turbofan engine will be equipped with such a FADEC system. O.C.

A82-40985 # Advanced aerodynamic wing design for commercial transports - Review of a technology program in the Netherlands. N. Voogt (Fokker, Amsterdam, Netherlands) and J. W. Slooff (National Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1088-1098. 16 refs.

An aerodynamic technology development program is described, whose main objectives are the formulation and validation of a computational procedure for the aerodynamic design of high aspect ratio wings for the transonic regime of short-/medium range commercial aircraft, as well as the establishment of a transonic technology base. An inverse procedure has been formulated for the wing design task which allows the excercise of explicit control over wing geometry while approaching the target pressure distribution as closely as possible. Experience has been gained in relating target pressure distributions to off-design conditions through two-dimensional airfoil and three-dimensional wing studies, together with wind tunnel verifications that included the assessment of high Reynolds number characteristics. A wing-body configuration computational analysis capability for drag minimization studies has also been achieved by the program. O.C.

A82-40986 # Recent airfoil developments at DFVLR. H. Körner and G. Redeker (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Entwurfs-Aerodynamik, Brunswick, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1099-1114. 37 refs.

New airfoils may bring a substantial improvement in the aerodynamic efficiency of airborne vehicles. A number of new airfoils based on transonic and laminar concept have been designed and investigated at DFVLR. With theoretical design methods and facilities for experimental verification at hand, airfoils for subsonic transports, sail-planes, propellers, helicopter rotors and combat aircraft have been developed. (Author)

A82-40987 # Wing-tip jets aerodynamic performance. J. M. Wu, A. Vakili, and Z. L. Chen (Tennessee, University, Tullahoma, TN). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1115-1121. 32 refs. Contract No. F33615-81-K-3034.

This paper presents the preliminary study of wing-tip jets blowing techniques to achieve improvements in the wings aerodynamics performance. The feasibility of utilizing wing-tip jets to reduce the currently popular winglets has been conducted. The idea is to study the potential of replacing solid winglets by more flexible wing-tip jets to suit changing flight conditions. The wing-tip jets modify the flow-field near the wing tip and could achieve better aerodynamic performance of the wing. A first order calculation has been made to check the air-jet advantage versus the disadvantage in degrading the jet-engine performance by bleed-off of compressed air. The result indicate that the power (or thrust) saved is significant enough to encourage us to explore this new concept. Munk's minimum induced drag criterion has been extended to formulate the split branched wing-tips by utilizing multi-ports jet. Moreover, it is also conceived that an added jet swirling effect may induce a circulatory motion. The induced local downwash could alter the new wing-tip flow and thus suppress the main wing-tip-roll-up vortex. For this purpose, wind-tunnel tests with a half-wing model have been conducted to verify this concept. This is done by controlling the jet blowing direction and magnitude. (Author)

A82-40988 # An experimental investigation of leading-edge spanwise blowing. W. Su, M. Liu, B. Zhou, C. Qiu, and S. Xiong (Beijing Institute of Aeronautics and Astronautics, Beijing, People's Republic of China). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1122-1132. 13 refs.

Oil flow visualizations and pressure measurements on a 30-deg swept trapezoidal wing were conducted to investigate leading edge spanwise blowing (LE SWB), which is very near the leading edge and along it. The LE SWB can provide a higher maximum lift coefficient than conventional SWB. It can generate a more stable jet leading edge vortex above the inboard wing, and the outboard wing leading edge vortex can also be enhanced. The flow patterns of the wing with LE SWB are similar to those of a strake-wing configuration. (Author)

A82-40989 # Vortex formation over double-delta wings. U. Brennenstuhl and D. Hummel (Braunschweig, Technische Universität, Brunswick, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1133-1146. 20 refs.

Low speed wind tunnel tests have been carried out on a series of double-delta wings. The effects of variations in leading edge kink angle and in kink position have been investigated by mens of three-component pressure distribution and flow-field measurements, as well as by flow visualization at a Reynolds number value of 1.3 million. At small angles of attack two primary vortices exist on each side of the wing, originating from the apex and from the leading-edge kink. At moderate kink angles these two vortices join each other with increasing angle of attack. The junction process is analysed in detail and is intrepreted as a 'potential flow effect'. At very large angles of attack vortex breakdown occurs within the jointed vortices, which leads to the limitation of the aerodynamic coefficients. (Author)

A82-40990 # CATIA - A computer aided design and manufacturing tridimensional system. F. Bernard (Avions Marcel Dassault-Breguet Aviation, Suresnes, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1147-1154.

A properietary computer graphics-aided, three-dimensional interactive application (CATIA) design system is described. CATIA employs approximately 100 graphics displays, which are used by some 500 persons engaged in the definition of aircraft structures, structural strength analyses, the kinematic analysis of mobile elements, aerodynamic calculations, the choice of tooling in the machining of aircraft elements, and the programming of robotics. CATIA covers these diverse fields with a single data base. After a description of salient aspects of the system's hardware and software, graphics examples are given of the definition of curves, surfaces, complex volumes, and analytical tasks. O.C.

A82-40991 # CDS-the designer's media, the analyst's model. D. P. Raymer (Rockwell International Corp., Los Angeles, CA) and S. K. Albrecht (Rockwell International Corp., Space Transportation and Systems Group, Downey, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1155-1163. 6 refs.

A proprietary Configuration Development System (CDS) is described which incorporates both a flexible interactive graphics program for the conceptual design of aerospace vehicles and a three-dimensional geometric data base which may be used by analysis programs. Experience to date with the CDS has demonstrated substantial productivity improvements, although, as noted by Sandusky (1978), such gains are more pronounced in the conduct of iteration procedures than in the reduction of throughtime. Nevertheless, optimal results are reached at an earlier stage of the design process. Graphics examples are given from CDS work on the FDL-5 and FDL-8 lifting body manned orbital vehicles. O.C.

A82-40992 * # Aircraft geometry verification with enhanced computer-generated displays. J. V. Cozzolongo (NASA, Ames Research Center, Moffett Field, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1163/a-1163/j. 11 refs.

A method for visual verification of aerodynamic geometries using computer-generated, color-shaded images is described. The mathematical models representing aircraft geometries are created for use in theoretical aerodynamic analyses and in computer-aided manufacturing. The aerodynamic shapes are defined using parametric bi-cubic splined patches. This mathematical representation is then used as input to an algorithm that generates a color-shaded image of the geometry. A discussion of the techniques used in the mathematical representation of the geometry and in the rendering of the color-shaded display is presented. The results include examples of color-shaded displays, which are contrasted with wire-frame-type displays. The examples also show the use of mapped surface pressures in terms of color-shaded images of V/STOL fighter-/attack aircraft and advanced turboprop aircraft. (Author)

A82-40993 # Technical and economic comparison of carbon fiber tape and woven fabric applications. G. Hilaire and G. Briens (Société Nationale Industrielle Aérospatiale, Laboratoire Central, Suresnes, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1164-1172.

A comparative study is made of the structural performance characteristics of various types of carbon fiber fabrics and unidirectional filament prepreg tapes, in view of the relative equality of the importance, in recent applications of carbon fiber composites, of weight reduction, strength maximization, and reductions in manufacturing costs. The comparisons are between a 3000-filament (3 K) tow, T 300 carbon fiber, 5 H satin weave cloth weighing 285 g/sq m when dry, and a 3 K T 300 tape. Both are impregnated with 5208 resin and in that state represent 60 percent fiber volume composites. The performance characteristics considered are interlaminar shear, notched and unnotched tensile strength, and compressive strength. The consequences of each alternative for manufacturing are assessed for the cases of manual and automated lay-up, machining and cut trimming. O.C.

A82-40994 # **Application of composite materials and new design concepts for future transport aircraft.** R. H. Lange and J. W. Moore (Lockheed-Georgia Co., Marietta, GA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1173-1181. 30 refs.

The application of advanced technologies and the use of innovative aircraft design concepts show the potential for significant improvement in the fuel efficiency of future transport aircraft envisioned for operation in the mid to late-1990s. This paper reviews recent preliminary design system studies of transport aircraft featuring cost/benefit analyses of advanced technology and new vehicle design concepts. Emphasis is directed toward the use of graphite epoxy composite materials in the primary and secondary structures of transport aircraft. The data on aircraft design concepts include preliminary design studies of Advanced Civil/Military Aircraft (ACMA) aircraft and innovative configurations. The aircraft design parameters include cruise Mach numbers of 0.75 to 0.80, design payloads from 330,000 to 772,000 lbs, and range from 3,500 to 4,000 nautical miles. (Author)

A82-40995 # **Sliced disc design - A composite conform concept for a turbo engine axial compressor.** R. Kochendörfer (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Bauweisen- und Konstruktionsforschung, Stuttgart, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1182-1191. 5 refs.

For an 800 kW turbo engine demonstrator an axial compressor concept in composite technology was developed. The aim was a reduction of mass and moment of inertia compared to a titanium design. The geometry and the blade spacing required a single-blade attachment concept. To minimize the problems in the shear loading area, the 'compressor rotor' was divided into individual segments, made of aluminum alloy. Each of the Al-segments represents the root part of a B/Al blade. In the leading and trailing edge areas these segments are shrunk together by composite hoops, which also sustain the centrifugal loads. As long as the shrinkage pressure is present, the segmented disk exhibits a similar behavior as an unsliced disk. This sliced disk concept was successfully proof-tested in cold spin tests up to the design level of 47,600 rpm, corresponding to a maximum blade tip speed of 420 m/sec. (Author)

A82-40996 # **Comparison of HP turbine 'deep blade design' effects in turbofan engine gas generators with different bearing structure configurations.** D. Rist (München, Technische Universität, Munich, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1192-1202. 5 refs.

Two different types of gas generator bearing structure configurations have been investigated for a projected turbofan engine based on the deep blade design concept. Mechanical analyses are carried out for defined operation and load cases to estimate the required mass increase for the main components. It is shown that when the HP turbine rotor blade chord length is increased by 50%, the mass of the turbofan engine core increases by about 7 and 11% for the two configurations investigated. V.L.

A82-40998 # **Redundant control unit for an advanced multispool engine.** G. Dahl (Bodenseewerk Gerätetechnik GmbH, Überlingen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1214-1221.

The advantages and disadvantages of the use of digital technology for the control of modern multispool engines are discussed with reference to a newly developed redundant digital engine control unit. The controller structure is discussed with emphasis on software design and software verification methods. It is shown that the many advantages resulting from the introduction of digital technology, such as increased reliability, improved maintainability, and internal controller intelligence, make up for the inevitable disadvantages associated with the sampling process and computer delay time. V.L.

A82-40999 # **Test results of chordwise and spanwise blowing for low-speed lift augmentation.** G. A. Howell (General Dynamics Corp., Fort Worth, TX). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1222-1234. 11 refs.

Low-speed wind tunnel tests were conducted on a large-scale and a small-scale powered model of a STOL wing/canard concept with engines mounted over the wing. In a basic configuration, both models exhausted the entire nozzle-flow momentum over vectoring flaps. In an alternate configuration, both models exhausted a portion of the flow from spanwise nozzles in the outer nacelle wall to obtain wing-leading-edge vortex augmentation. Force and pressure data were obtained for the small-scale model powered by compressed air. Pressure and thermal data were obtained for the large-scale model powered by two turbojet engines. Chordwise blowing decreased the pressures over the entire wing upper surface and even on the canard at high angles of attack. The power-induced lift coefficients were moderate for chordwise blowing. Spanwise blowing increased the strength of the wing leading-edge vortex and reduced the pressure on the wing upper surface beneath the path of the vortex. (Author)

A82-41000 # **Aerodynamic research applications at Boeing.** A. L. Nagel (Boeing Commercial Airplane Co., Seattle, WA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1235-1242. 24 refs.

This paper shows by several recent examples how aerodynamic research tools and methods have been applied to the design of subsonic commercial transport airplanes. Examples include wing modifications, nacelle integration, vortex generators, and cab design. Some recent high Reynolds number tests in the NASA 0.3-meter Transonic Cryogenic Tunnel are also described. (Author)

A82-41001 # **Wind tunnel test and aerodynamic analysis of three aeroelastically tailored wings.** W. W. Braymen, W. A. Rogers (General Dynamics Corp., Fort Worth, TX), and M. H. Shirk (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1243-1255. 11 refs. USAF-sponsored research.

Aeroelastic tailoring of composite lifting surfaces was validated in a program that involved design, fabrication, and transonic wind tunnel testing of three static aeroelastic wings in addition to a set of steel wings. Each aeroelastic wing had unique design objectives. The test featured aeroelastic shape documentation through the use of photogrammetry along with the simultaneous acquisition of forces and pressures. Highlights of the aerodynamic test results are presented, with emphasis placed on test-to-theory comparisons. The strong points as well as areas of needed improvement in the aerodynamic design methods are discussed. The investigation demonstrates that the design of composite lifting surfaces should include consideration of aerodynamic benefits available through tailoring. (Author)

A82-41002 * # **Upper Vortex Flap - A versatile surface for highly swept wings.** D. M. Rao (Vigyan Research Associates, Inc., Hampton, VA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1256-1266. 9 refs. NASA-supported research.

The Upper Vortex Flap (UVF) is a multipurpose surface concept to improve the subsonic aerodynamics of highly swept delta wings. Hinged along the leading edges and deployed from the wing upper surface, the UVF generates a vortex inboard on the wing in addition to the leading-edge vortex acting on the flap. The relative suction levels on the wing and on the flap surface, governed by the flap angle and angle of attack, lead to a variety of functional applications viz. lift increment, drag modulation, lift/drag improvement and roll augmentation. This paper presents wind tunnel force and pressure measurements on a 74-deg flat plate delta to define the UVF-related vortex effects and to assess its potential as a versatile control surface in different angle-of-attack regimes. (Author)

A82-41003 * # **Analytical study of vortex flaps on highly swept delta wings.** N. T. Frink (NASA, Langley Research Center, Hampton, VA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1267-1275. 25 refs.

This paper highlights some current results from ongoing analytical studies of vortex flaps on highly swept delta wings. A brief discussion of the vortex flow analysis tools is given along with comparisons of the theories to vortex flap force and pressure data. Theoretical trends in surface pressure distribution for both angle-of-attack variation and flap deflection are correctly predicted by Free Vor-

the economic basis specified. Results indicate that shale oil fuels refineries are more capital intensive than a comparable size petroleum refinery. No attempt was made at optimization.

Pilot plant process data have been incorporated in three design bases for manufacturing military fuels from raw Occidental shale oil. Processing schemes for 90,000 BPCD refineries to maximize either JP-4, JP-8 or to produce JP-4 plus other military fuels are presented. The processing sequence comprises moderate severity hydrotreating, fractionation, anhydrous HCl extraction and hydrocarcking. Plant capacities and product yields were not optimized. Investments for the three refinery options considered are 1.5 to 2.0 times as much as a comparable size petroleum fuels refinery. At maximum JP-4 or JP-8 production the yields are about 87 and 53 volume % of total refinery energy input, respectively. Overall, refinery thermal efficiency is > or = 75%. Inspection data are presented for five samples of specification aviation turbine fuels prepared from pilot plant operations. GRA

AN EXPLORATORY RESEARCH AND DEVELOPMENT PROGRAM LEADING TO SPECIFICATIONS FOR AVIATION TURBINE FUEL FROM WHOLE CRUDE SHALE OIL. PART 3: PRODUCTION OF SPECIFICATION OF JP-4 FUEL FROM GEOKINETICS SHALE OIL Interim Report, 1 Jan. - 1 Apr. 1980
H. E. Reif, J. P. Schwedock, and A. Schneider Wright-Patterson AFB, Ohio AFWAL Oct. 1981 45 p refs 3 Vol.
(Contract F33615-78-C-2024; AF Proj. 2480)
(AD-A112683; AFWAL-TR-81-2087-Pt-3) Avail: NTIS HC A03/MF A01 CSCL 21/4

270 Barrels of specification JP-4 jet fuel were produced by hydrorefining 890 barrels of raw Geokinetics shale oil under severe operating conditions in a continuous process development unit. On a once thru basis the yield of JP-4 off the hydrotreater was about 35 volume % of the feed. Preliminary estimates of plant investments and economics indicate that for the combination severe hydrorefining and hydrocracking, an 85 volume % yield can be attained based on total refinery energy input. Capital investments and manufacturing costs do not appear to be excessive for a shale oil refinery. GRA

LABORATORY-SCALE SIMULATION OF UNDERGROUND COAL GASIFICATION: EXPERIMENT AND THEORY
J. R. Creighton and C. B. Thorsness 28 Aug. 1981 26 p refs Presented at the Western States Sect. Meeting of the Combust. Inst., Tempe, Ariz., 19-20 Oct. 1981
(Contract W-7405-eng-48)
(DE82-001083; UCRL-86473; CONF-811041-2) Avail: NTIS HC A03/MF A01

Laboratory-scale experiments simulating underground coal gasification are described. A 1 cm borehole is drilled through a block of coal which is cut to fit in a 55 gallon oil drum. Inlet gas may be air or oxygen/steam mixture at various ratios. The blocks are burned for a period of several hours at a prescribed flow schedule, with appropriate instrumentation. Gas quality is found to be relatively independent of coal type for the range of sub-bituminous coals tested. After the burn the blocks of coal are cut open to examine the cavity. A mathematical modeling effort supports these experiments. The models are restricted to pure carbon, to simplify the chemistry in the model. When plug flow is assumed in the cavity the model predicts reasonable cavity shape downstream, but an incorrect shape upstream. When aerodynamic flow, including viscosity and vortex formation, is calculated in the cavity reasonable cavity shapes are obtained.

ADVANCED CASTING: TODAY AND TOMORROW
Dietmar Mietrach 1982 20 p refs Presented at AGARD Meeting on Adv. Casting Technol, Brussels, 4-9 Apr. 1982
Avail: NTIS HC A02/MF A01

The state of aluminum casting technology in terms of processes, component sizes, design and material-scientific data as well as mechanical characteristics was established during visits to foundries in the USA, Canada, France, Italy, Great Britain and the Federal Republic of Germany. Components of the primary structure of Tornado and ALPHA aircraft, (pylon, intake floor) classified according to the degree of difficulty during casting, were used to compare existing designs (riveted sheet metal and machined parts) and cast versions with regard to cost reduction and technical reliability. Visual inspection, dimensional checks, chemical composition analysis, penetrant tests, X-ray tests, metallographic investigations, and tensile tests were carried out. Cost savings of 25% and weight savings of 20% can be achieved by using castings. Author (ESA)

MULTIFUNCTION MULTIBAND AIRBORNE RADIO ARCHITECTURE STUDY Final Report, Apr. 1978 - Jan. 1980
L. N. Ma, S. K. Ogi, M. Y. Huang, L. L. Bodner, and P. Martin Wright-Patterson AFB, Ohio AFWAL Jan. 1982 379 p refs

The demands of modern military avionic communication, radio navigation, and cooperative identification (CNI) equipment has been greatly expanded as the result of the need for antijam (AJ), low probability of intercept (LPI), higher navigation accuracy, and increased volume of information transfer. These demands are verified in programs such as GPS, JTIDS, SEEK TALK, SINCGARS and AFSAT I and II. The cost of this additional capability has severely hampered the ability of the Government to procure new CNI systems and equipment with desired performance capabilities. The problem is further compounded by the lack of available space in the tactical aircraft, the transition of new equipment into the inventory, and the retention of many current systems. The multifunction multiband airborne radio system (MFBARS) program is formulated to explore the feasibility of producing a modern CNI system at an affordable life cycle cost (LCC) and within real estate requirements. A cost effective system approach was developed that revolved around high technology RF-LSI analog components that are in the development stage, high speed digital pre-processor elements and a programmable signal processor all under control of a host processor configuration. This design trades the ultimate gain in volume, weight and life cycle cost against a reasonable risk for the mid 1980's development. Author (GRA)

FEASIBILITY STUDY OF A 270V dc FLAT CABLE AIRCRAFT ELECTRICAL POWER DISTRIBUTED SYSTEM Final Report, Dec. 1980 - Jan. 1982
M. J. Musga and R. J. Rinehart Jan. 1982 272 p refs
(Contract N62269-81-C-0231)
(AD-A114026; D182-10816-1; NADC-82023-60) Avail: NTIS HC A12/MF A01 CSCL 10/2

This report documents the efforts of a one man-year feasibility study to evaluate the usage of flat conductors in place of conventional round wires for a 270 volt direct current aircraft power distribution system. This study consisted of designing electrically equivalent power distribution harnesses in flat conductor configurations for a currently operational military aircraft. Harness designs were established for installation in aircraft airframes which are: (1) All metal, or (2) All composite, or (3) a mixture of both. Flat cables have greater surface areas for heat transfer allowing higher current densities and therefore lighter weight conductors, than with round wires. Flat cables are less susceptible to electromagnetic effects. However, these positive factors are partially offset by installation and maintenance difficulties. This study concludes that the extent of these difficulties can be adequately limited with appropriate modification to present installation and maintenance practices. A comparative analysis of the flat and the round conductor power distribution harnesses was made for weight, cost, maintenance and reliability. The knowledge gained from the design and comparative analysis phases was used to generate design criteria for flat power cable harnesses and to identify and prioritize flat cable harness components and associated production tooling which require development. MEASURING THE FLOW PROPERTIES OF SLOTTED TEST-SECTION WALLS
Sune B. Berndt May 1982 15 p refs
(FFA-135) Avail: NTIS HC A02/MF A01

By measuring pressure distributions at two levels near a slotted wall it is possible to deduce simultaneous values of normal and longitudinal velocities. Such measurements require, for their proper interpretation, a basic understanding of the flow in the neighborhood of the wall. An analysis of the problems involved is provided. Author

(AD-A113910; AFWL-TR-81-28) Avail: NTIS HC A05/MF A01 CSCL 20/6

Measurements of the unsteady flow field affecting optical propagation quality have been made with both aerodynamic and direct optical instrumentation. Properties affecting degradation of coherent radiation beams propagated from within the turret have been investigated. These properties include both the magnitude and scale sizes of the fluctuating index-of-refraction field present in the turbulent shear layers and separation regions of the turret flow field. Direct optical degradation information was obtained by holographic interferometry and quantified through techniques presented here. Aerodynamic measurements were made with hot-wire anemometry and multiple-port probes. Comparisons between the aerodynamically and optically deduced data are presented. These data can be used directly to estimate trends in expected loss of optical quality of a coherent beam for various flight speeds, altitudes, wavelengths and azimuthal turret angles. More data are now available for estimating the effects of unsteady aerodynamic flow fields on optical propagation quality. Data were obtained for Reynolds numbers near those occurring at full-scale flight conditions over a range of Mach number from 0.55 to 0.75. Investigation results generally agree with those obtained previously on smaller scale models and indicate that severe optical degradation can be present at aft-looking azimuth angles. Author (GRA)

RELIABILITY MODEL FOR PLANETARY GEAR
Michael Savage (Akron Univ.), Charles A. Paridon (Hewlett Packard Co., Sunnyvale, California), and John J. Coy (Army Aviation Research and Development Command, Cleveland, Ohio) 1982 22 p refs Proposed for Presentation at Design Engr. Tech. Conf., Washington, D.C., 12-15 Sep. 1982; sponsored by ASME Prepared in cooperation with Army Aviation Research and Development Command
(NASA-TM-82859; NAS 1.15:82859; AVRADCOM-TR-82-C-6) Avail: NTIS HC A02/MF A01 CSCL 13I

A reliability model is presented for planetary gear trains in which the ring gear is fixed, the Sun gear is the input, and the planet arm is the output. The input and output shafts are coaxial and the input and output torques are assumed to be coaxial with these shafts. Thrust and side loading are neglected. This type of gear train is commonly used in main rotor transmissions for helicopters and in other applications which require high reductions in speed. The reliability model is based on the Weibull distribution of the individual reliabilities of the transmission components. The transmission's basic dynamic capacity is defined as the input torque which may be applied for one million input rotations of the Sun gear. Load and life are related by a power law. The load life exponent and basic dynamic capacity are developed as functions of the component capacities. Author

PREDICTION OF FATIGUE CRACK GROWTH RATES UNDER VARIABLE LOADING USING A SIMPLE CRACK CLOSURE MODEL
A. U. deKoning and H. H. vanderLinden Apr. 1980 45 p refs Presented at 11th ICAF Symp., Noordwijkerhout, Netherlands, 20-22 May 1981
(Contracts NIVR-1777; NIVR-1822; NIVR-1823)
(NLR-MP-81023-U) Avail: NTIS HC A03/MF A01

A model which predicts fatigue crack growth rates in aluminum alloys subjected to flight service loading is presented. The model is based on an approximate description of the crack opening behavior and was applied successfully in an analysis of effects of crack growth acceleration and retardation observed experimentally under variable amplitude loading. The model describes effects of the plane strain to plane stress transition and of relatively high overloads on crack growth rate of the crack. Author (ESA)

BASELINE MONITORING USING AIRCRAFT LASER RANGING
W. B. Krabill, F. E. Hoge, and C. F. Martin Jun. 1982 28 p refs
(NASA-TM-73298; NAS 1.15:73298) Avail: NTIS HC A03/MF A01 CSCL 08B

The use of aircraft laser ranging for the determination of baselines between ground based retroreflectors was investigated via simulations and with tests at Wallops Flight Center using the Airborne Oceanographic Lidar (AOL) on the Wallops C-54 aircraft ranging to a reflector array deployed around one of the Wallops runways. The aircraft altitude and reflector spacing were chosen on the basis of scaled down modeling of spacecraft tracking from 1000 km of reflectors separated by some 52 km, or of high altitude (10 km) aircraft tracking of reflectors separated by some 500 m. Aircraft altitudes flown for different passes across the runway reflector array varied from 800 m to 1350 m, with 32 reflectors deployed over an approximately 300 m x 500 m ground pattern. The AOL transmitted 400 pulses/sec with a scan rate of 5/sec in a near circular pattern, so that the majority of the pulses were reflected by the runway surface or its environs rather than by retroreflectors. The return pulse characteristics clearly showed the high reflectivity of portions of the runway, with several returns indistinguishable in amplitude from reflector returns. For each pass across the reflector field, typically six to ten reflector hits were identified, consistent with that predicted by simulations and the observed transmitted elliptical pulse size. maximum lift coefficient and lift to drag ratio at high angles of attack, a broader range of high lift coefficients, and less abrupt stall characteristics. (Author)

A82-39102 * # Dynamic stability of flexible forward swept wing aircraft. T. A. Weisshaar and T. A. Zeiler (Purdue University, West Lafayette, IN). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1325.* 12 p. 25 refs. Grant No. NAG1-157.

This paper describes potential vehicle instability modes for forward swept wing aircraft and other divergence prone aircraft. Examples show that either body-freedom flutter or aircraft aeroelastic divergence may occur depending upon the airplane planform geometry and mass distribution. These vehicle instabilities may occur at speeds very different than the clamped wing aeroelastic divergence speed. (Author)

A82-39103 # Optimal three-dimensional turning performance of supersonic aircraft. C.-F. Lin (Wisconsin, University, Madison, WI). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1326.* 10 p. 17 refs.

This paper discusses real-time, on-line three-dimensional turning maneuvers of supersonic aircraft with emphasis on the problems of minimum-time and minimum-fuel turns. The minimum-time problem is completely solved. For the minimum-fuel case, the problem of minimum-fuel turn to a line is solved while suggestions for further research on minimum-fuel turn in three dimensions are presented. Two mathematical models of the aerodynamic and engine characteristics are designed to facilitate the application of the optimal control theory to analyze a wide range of flight programs. One such model is a typical lightweight, high thrust-to-weight ratio fighter used for the computation of minimum-time problem. The other is a rocket-powered aircraft used for the computation of the minimum-fuel problem. (Author)

A82-39105 # The correlation of flight test and analytic M-on-N air combat exchange ratios. D. S. Hague (Aerophysics Research Corp., Bellevue, WA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1328.* 6 p. Contract No. F33615-80-C-3003.

This paper compares analytic and flight test predictions of Many-on-Many air combat performance capability. It is shown that stochastic effects dominate air combat encounter outcomes and that air combat performance estimates should be based on a large sample of encounters. Overall exchange ratios, the number of red losses per blue loss, predicted by flight test and analysis are within 5% of each other. Trends in exchange ratio with force size obtained by the two methods are also similar. Finally, it is shown that air combat performance is sensitive to both force size ratio and the total number of aircraft engaged and that differences in performance between aircraft types may diminish with increasing aircraft numbers. (Author)

A82-39106 * # Unique flight characteristics of the AD-1 oblique-wing research airplane. R. E. Curry and A. G. Sim (NASA, Flight Research Center, Edwards, CA). *American Institute of Aeronautics and Astronautics. Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1329.* 8 p. 9 refs.

Flight characteristics associated with an oblique-wing airplane have been studied with limited scope and complexity using the AD-1 research vehicle. The AD-1 is a low-speed, low-cost, manned airplane with an aeroelastically tailored wing that can be pivoted 0 to 60 deg asymmetrically. Results of the flight tests include aerodynamic parameter extraction, verification of the aeroelastic wing design criteria, trim requirements, stall characteristics, and an evaluation of the handling qualities and basic control system requirements. Some of the unique characteristics of these results that pertain to the oblique-wing design are presented. (Author)

A82-39107 * # Analysis of in-trail following dynamics of CDTI-equipped aircraft. J. A. Sorensen and T. Goka (Analytical Mechanics Associates, Inc., Mountain View, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1330.* 10 p. 14 refs. Contract No. NAS1-16135.

In connection with the necessity to provide greater terminal area capacity, attention is given to approaches in which the required increase in capacity will be obtained by making use of more automation and by involving the pilot to a larger degree in the air traffic control (ATC) process. It was recommended that NASA should make extensive use of its research aircraft and cockpit simulators to assist the FAA in examining the capabilities and limitations of cockpit displays of traffic information (CDTI). A program was organized which utilizes FAA ATC (ground-based) simulators and NASA aircraft and associated cockpit simulators in a research project which explores applications of the CDTI system. The present investigation is concerned with several questions related to the CDTI-based terminal area traffic tactical control concepts. Attention is given to longitudinal separation criteria, a longitudinal following model, longitudinal capture, combined longitudinal/vertical control, and lateral control. G.R.

A82-39117 * # Flight dynamics of rotorcraft in steep high-g turns. R. T. N. Chen (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1345.* 16 p. 21 refs.

An analyticl procedure developed to permit a systematic examination of rotorcraft flight dynamics in steep high-g turns is presented. The procedure is used in a numerical investigation of a tilt-rotor aircraft and three single-rotor helicopters that have different types of main rotor systems. The results indicate (1) that strong coupling in longitudinal and lateral-directional motions exists for these rotorcraft in high-g turns; (2) that for single-rotor helicopters, the direction of turn has a significant influence on flight dynamics; and (3) that a stability and control augmentation system that is designed on the basis of standard small-disturbance equations of motion from steady straight and level flight and that otherwise performs satisfactorily in operations near 1 g, becomes significantly degraded in steep turning flight. (Author)

A82-39118 * # A ground-simulation investigation of helicopter decelerating instrument approaches. J. V. Lebacqz (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1346.* 11 p. 24 refs.

In connection with the expansion of civil helicopter operations in the current era, the effect of helicopter flight and control characteristics on the flying qualities for instrument flight rules (IFR) flight have become a factor of concern, and a research program has been initiated to investigate IFR certification criteria. A description is presented of an experiment which is the sixth in a series of ground- and flight-simulation investigations. This piloted-simulator experiment was conducted to examine the influence of stability-control augmentation, display information format, and approach-task effects on helicopter flying qualities for terminal-area operations incorporating a deceleration in instrument meteorological conditions. Simulated test configurations were evaluated for precision approaches with an instrument deceleration from 60 to about 15 knots in both calm air and simulated moderate turbulence and wind shear. G.R.

A82-39119 # Maneuver stability of a vehicle with a towed body. B. L. Nagabhushan (Goodyear Aerospace Corp., Defense Systems Div., Akron, OH) and E. M. Cliff (Virginia Polytechnic Institute and State University, Blacksburg, VA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1347.* 9 p. 8 refs. Research supported by the Virginia Polytechnic Institute and State University.

Nonlinear equations of motion are derived and subsequently linearized to describe the coupled dynamics of a vehicle with a towed body. Using these stability of an aircraft with a sling load has been determined for simple maneuvers where the vehicle is maintaining a straight and level flight path or performing a steady turn. The effect of orienting the corresponding thrust vector of the aircraft on the system stability is examined by considering the thrust (1) fixed in inertial space, (2) fixed with respect to the vehicle relative wind. Typically, towing cable length, towed body to vehicle mass ratio, and load factor in a turn have been found to affect stability of the aircraft and its sling load. These results are illustrated here with an example of a maneuvering helicopter with a sling load. (Author)

A82-39120 # Application of multivariable model following method to flight controller. K. Kanai (Defense Academy, Yokosuka, Japan), P. N. Nikiforuk (Saskatchewan, University, Saskatoon, Canada), S. Uchikado, and N. Hori. *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1349.* 7 p.

The present investigation is concerned with the problem of designing a model following control system for a multivariable linear plant, taking into account an application to the synthesis of a multiinput multioutput flight controller. Attention is given to a problem statement, the construction of a model following system via state feedback plus input dynamics, and the synthesis of a Control Configured Vehicle (CCV) controller. It is found that the construction of a model following system via state feedback with input dynamics compensator becomes possible even for the case of the singular control matrix. Using the proposed method, CCV modes, such as desirable precision maneuvers, independent velocity, and altitude changes, are achieved. G.R.

A82-39121 # Design and analysis of a multivariable control system for a CCV-type fighter aircraft. D. B. Ridgely, S. S. Banda (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH), and J. T. Silverthorn (USAF, Wright Aeronautical Laboratories and Institute of Technology, Wright-Patterson AFB, OH). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1350.* 8 p. 10 refs.

The theory of high-gain, error-actuated feedback control was applied to the design of a longitudinal decoupling flight control system for an advanced fighter aircraft. Because of the structure of the system, measurement variables different from the outputs are necessary to apply this method. This paper describes how entire eigenstructure assignment can be used to determine appropriate measurement equations by assigning their corresponding transmission zeros. A singular value decomposition was used to choose the eigenvectors from their permissible subspaces. Proper selection of eigenvalues/eigenvectors was shown to be crucial to the successful application of this theory. (Author)

A82-39122 # **An MLS with computer aided landing approach.** M. N. Wagdi (Riyadh, University, Riyadh, Saudi Arabia). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1352.* 9 p. 5 refs.

A computerized landing approach path definition that utilizes the MLS radio navigational aid is presented. An algorithm is developed which identifies the minimum time path that connects the initial MLS engage point to the touch down point. Such path is generally composed of two segments. The first segment begins at the MLS engage point and ends at the beginning of the straight glide slope. The second segment starts at the beginning of the straight glide slope and ends at the touch down point. The MLS azimuth and elevation and DME signals are processed by an on board computer that displays on a CRT the aircraft position relative to the ideal position of the optimal computed landing pattern. The present technique allows the initiation of landing approaches from wide range of headings and elevations, thus resulting into more efficient terminal area traffic control. Also it is suitable for low visibility landing approaches. (Author)

A82-39123 # **Perspectives of the flying qualities specification.** S. G. Fuller and D. J. Moorhouse (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1354.* 9 p. 24 refs.

A combined flying qualities and flight controls conference was held to discuss proposed changes to MIL-F-8785C and MIL-F-9490D. These changes were primarily due to the new MIL-Standard and Handbook format being developed. A summary is presented of the formal and informal presentations and the discussions related to flying qualities topics. Included are organization of the requirements, equivalent systems, alternate criteria, atmospheric disturbance effects and the relationship of the flying qualities and flight control system requirements. In recent years the flying qualities specification has lost credibility. Results of this credibility loss and the solutions for the future are discussed. (Author)

A82-39124 # **Guidance for the use of equivalent systems with MIL-F-8785C.** T. A. Gentry (USAF, Flight Dynamic Laboratory, Wright-Patterson AFB, OH). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1355.* 11 p. 20 refs.

It is pointed out that handling qualities requirements for military conventional aircraft are specified in MIL-F-8785C, Military Specifications - Flying Qualities of Piloted Airplanes'. This specification places requirements on the characteristics of the overall aircraft system as perceived by the pilot during piloted control. An application of the specification in the case of conventional aircraft presents no difficulties. However, there may be problems with more complex flight control systems. In order to compare future augmented aircraft systems to MIL-F-8785C the equivalent system approach has been suggested. The present investigation provides guidance in the application of the equivalent system approach to augmented aircraft longitudinal dynamics and similar application to lateral-directional dynamics where appropriate. The equivalent of an augmented system is actually produced by matching the actual high-order system with an equivalent low-order system. G.R.

A82-39125 * # **A modern approach to pilot/vehicle analysis and the Neal-Smith criteria.** B. J. Bacon and D. K. Schmidt (Purdue University, West Lafayette, IN). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1357.* 10 p. Grant No. NAG4-1.

The present investigation is concerned with the development of a better pilot modelling technique via optimal control theory, taking into account concepts concerning 'pilot rating' considered by Neal and Smith (1970). The investigation conducted by Neal and Smith had the objective to provide data on the effects of Flight Control System dynamics and to develop a design criterion capable of pinpointing pilot problem areas encountered in performing a given task. Neal and Smith devised a 'pilot-in-the-loop' analysis capable of showing problem areas in pitch attitude tracking. Unfortunately the employed method has some drawbacks. The current investigation attempts, therefore, to provide an alternate approach which makes use of an optimal-control pilot model. An optimal control model (OCM) had been discussed by Kleinman et al. (1970). It is shown that the alternate approach, based on the OCM, offers some distinct advantages. G.R.

A82-39126 # **Analysis and wind tunnel tests of a probe used to sense altitude through measurement of static pressure.** K. D. Tillotson (General Dynamics Corp., Pomona, CA) and A. E. Fuhs (U.S. Naval Postgraduate School, Monterey, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1361.* 10 p. 8 refs. Navy-supported research.

A static pressure probe was tested to determine the feasibility of using the probe, as an integral part of a missile nose, to sense missile altitude. Experiments were conducted at Mach 2.0 and at Mach 1.81. At Mach 2.0, the static pressure probe will perform within altitude specifications of 25,000 feet + or - 2,000 feet at angles-of-attack ranging from - 6 to + 6 degrees. At Mach 2.0, within an angle-of-attack ranging from 0 to 6 degrees, the probe will measure free stream static pressure within 4 percent; a 4 percent error in measurement is equivalent to an altitude error of 900 feet. The missile nose shock will remain downstream of the probe pressure ports for flight Mach numbers above 1.5. (Author)

A82-39129 # **Use of rotary balance and forced oscillation test data in six degrees of freedom simulation.** J. Kalviste (Northrop Corp., Hawthorne, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1364.* 11 p.

New analysis techniques are presented that will blend the data from the rotary balance test, forced oscillation test and computed dynamic derivatives for a nonlinear 6 DOF simulation. A component of the rotation vector about the velocity vector is used with the rotary balance test data. The other components of the rotation vector are used with the forced oscillation test data and computed derivatives. The problem of separating the pure rotational and acceleration terms of the forced oscillation test data is resolved. Recommendations are made in the data reduction procedure for forced oscillation testing to make the results more usable for aircraft motion simulation. (Author)

A82-39132 # **Close-coupled canard-wing vortex interaction and Reynolds stress acquisition.** W. Calarese (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1366.* 12 p. 7 refs.

The present experiment investigates the interaction of canard and wing vortices and their effect on the lifting wing's flow field turbulence and Reynolds stresses. Spanwise wing blowing was used to enhance the leading edge vortex and alter the vortex trajectory in an effort to keep it locked to the wing's leading edge for lift enhancement. The turbulence intensity and Reynolds stresses were obtained by using hot film anemometers. Air blowing enhances the circulation over the wing, preventing extensive flow separation. Reynolds stresses, mean velocity, and turbulence intensity values illustrate the vortex structure. (Author)

A82-39134 # **Analysis of an airplane windshield anti-icing system.** P. Ross (Ross Aviation Associates, Sedgwick, KS). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1372.* 8 p.

This report documents the analysis methods developed to predict the performance of the windshield hot air anti-icing system on a business jet airplane. Flight data gathered from dry air and natural icing tests are used to develop and verify the accuracy of a procedure that will predict the windshield surface temperature for either wet or dry air. It is shown that windshield surface temperatures can be estimated to an accuracy of + or - 5% for a wide range of aircraft conditions. It is demonstrated that the method is somewhat conservative for all conditions. (Author)

A82-39135 * # **NASA Dryden's experience in parameter estimation and its uses in flight test.** K. W. Iliff and R. E. Maine (NASA, Flight Research Center, Edwards, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1373.* 16 p. 17 refs.

An explanation of the parameter estimation method used at the Dryden Flight Research Facility is presented, and an overview is provided of experience related to the employment of this method, taking into account the utilization of this experience in flight tests. According to a definition of the aircraft parameter estimation problem, the system investigated is asumed to be modeled by a set of dynamic equations containing unknown parameters. To determine the values of the unknown parameters, the system is excited by a suitable input, and the input and actual system response are measured. The values of the unknown parameters are then inferred, based on the requirement that the model response to the given input match the actual system response. Examples of parameter estimation in flight test are discussed, giving attention to the F-14 fighter, the HiMAT (high maneuverable aircraft technology) vehicle, and the Space Shuttle. G.R.

A82-39141 * # **Effects of vortex breakdown on longitudinal and lateral-directional aerodynamics of slender wings by the suction analogy.** C. E. Lan and C.-H. Hsu (Kansas, University, Lawrence, KS). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th,* S-N data utilization, S-N curve reduction factor and curve shape, cycle counting method, structure classification, fatigue test requirement and in-service monitoring. Current status and an overview are presented of a parallel AGARD effort to compile a 'Helicopter Fatigue Design Guide'. (Author)

A82-40543 # **Optimum structural design.** R. L. Bennett (Bell Helicopter Textron, Fort Worth, TX). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 398-407. 12 refs.

Four typical helicopter engineering analyses have been combined with a nonlinear programming (NLP) algorithm to produce closed loop design-oriented analyses. The resulting models are shown to be very effective in supporting detailed design by eliminating the existing external man-in-the-loop iterative process. The nonlinear programming problem and how it relates to the engineering design process is described, along with typical NLP algorithms and how they are combined with conventional engineering analyses. C.D.

A82-40544 # **Design and fabrication of a composite rear fuselage for the UH-60 /Black Hawk/.** D. G. Orlino (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) and B. F. Kay (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 408-416.

The primary objective of the program to design a composite rear fuselage (CRF) is fabrication cost reduction, and other concerns are a 10% weight savings, improved reliability and maintainability, and increased ballistic survivability. The CRF design comprises a stiffened skin, with five major panels, bulkheads, and frames. A modular repair concept resulted in reduced life-cycle cost, introducing reliability and maintainability into the design. In order to prevent fuel fires on impact with high explosive incendiary projectiles, rigid ballistic foam was used to fill the fuel cell. Visual inspection as well as destructive tests were completed, and necessary tooling changes were implemented. Objectives being met, a full-scale static test article is being produced. R.K.R.

A82-40545 # **In-plane shear test of thin panels.** G. L. Farley and D. J. Baker (U.S. Army, Structures Laboratory, Hampton, VA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 417-425. 5 refs.

Efficient application of thin gage composite materials to helicopter fuselage structures necessitates that the materials be designed to operate at loads several times higher than initial buckling load. Methods are required to accurately measure and predict the response of thin gage composites when subjected to these loads. This paper presents the results of an analytical and experimental study of the behavior of thin gage composite panels subjected to in-plane shear loads. Finite element stress analyses were used to aid in the design of an improved shear fixture that minimizes adverse corner stresses and tearing and crimping failure modes characteristic of commonly used shear fixtures. Tests of thick buckle resistant aluminum panels and thin aluminum and composite panels were conducted to verify the fixture design. Results of finite element stress and buckling analyses and diagonal tension theory predictions are presented. Correlation of experimental data with analysis indicated that diagonal tension theory can be used to predict the load-strain response of thin composite panels. (Author)

A82-40546 # **A summary of weight savings data for composite VSTOL structure.** R. L. Foye (U.S. Army, Research and Technology Laboratory, Moffett Field, CA) and R. Arden (U.S. Army, Aviation Research and Development Command, St. Louis, MO). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 426-437. 96 refs.

This paper summarizes the weight savings that have been obtained over the last ten years through the application of advanced composite materials to each of the major structural weight groups of a VSTOL airframe. The data has been drawn from journal articles, published papers, R&D reports, and personal communications. Helicopter, VSTOL, and fixed wing applications of composites have been included. The data is not comprehensive but represents a significant sampling of all recent composite airframe designs. (Author)

A82-40547 # **Structural design of a crashworthy landing gear for the AH-64 Attack Helicopter.** J. M. McDermott (Hughes Helicopters, Inc., Culver City, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 438-450.

Requirements for the design of a landing gear for helicopters are considered. In the case of the AH-64 Attack Helicopter, an additional consideration is related to air transportability requirements of the helicopter, necessitating a kneeling requirement in the landing gear configuration in order to reduce the height of the helicopter to fit into the cabin of the cargo aircraft transporting it. This kneeling requirement was also utilized to provide a high degree of crash protection. According to specification, protection of the crew has to be provided for conditions involving a vertical impact velocity of as high as 42 ft/sec. In order to meet this requirement, it was necessary to use the landing gear to absorb as high a proportion of the vertical kinetic energy as was feasible before the fuselage contacted the ground. Attention is given to the configuration of the landing gear for the AH-64, the design criteria, details of impact energy absorption, the integration of the landing gear into the airframe, and static structural testing. G.R.

A82-40548 # **Ringfin augmentation effects.** H. E. Lamont (Bell Helicopter Textron, Fort Worth, TX). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 451-460.

The ringfin concept has been developed since 1975 as a potential remedy for a number of concerns experienced in connection with the operation of single main rotor/tail rotor helicopters. This concept involves the use of a thrust ring around the tail rotor. The ring acts as fin, and generates lift force (antitorque). The present investigation is concerned with the measured augmentation effects in ground running, in hover and side flight, in forward translation, and mixing of the rotor wakes. The investigation shows that under static thrust conditions the tail rotor flow generates an induced positive force on the ring. The rotor tip vortices are dissipated with downstream flow motion, and an expanding slowed-velocity wake is created. G.R.

A82-40549 * # **Performance of the Rotor Systems Research Aircraft calibrated rotor loads measurement system.** C. W. Acree, Jr. (NASA, Ames Research Center, Moffett Field, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 461-473. 6 refs.

The compound Rotor Systems Research Aircraft (RSRA) is designed to make high accuracy, simultaneous measurements of all rotor forces and moments in flight. Physical calibration of the rotor force- and moment-measurement system when installed in the aircraft is required to account for any errors and to ensure that measurement system accuracy is traceable to the National Bureau of Standards. The first static calibration and associated analysis has been completed with good results. Hysteresis was a potential cause of static calibration errors, but was found to be negligible in flight, and analytical methods have been devised to eliminate its effects on calibration data. Flight tests confirmed that the calibrated rotor loads measurement system performs as expected in flight, and that it can dependably make direct measurements of fuselage vertical drag in hover. (Author)

A82-40550 # **Error minimization in ground vibration testing.** E. J. Nagy (Kaman Aerospace Corp., Bloomfield, CT). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 474-480. 5 refs.

The Ground Vibration Testing (GVT) of a U.S. Army AH-1G helicopter airframe has been successfully completed. New methods have been developed to identify and minimize the errors in GVT. These methods can be utilized in future programs. The new approaches make effective use of a digital signal analyzer as a 'working tool'. Examples are presented to demonstrate the use of the digital signal analyzer in connection with a number of applications. Attention is given to methods for the determination of the linear range, the location and identification of structural modes, the selection of narrow band sweeps, the selection of driving points, the local mode effect, driving point acceleration mobility checks for positive imaginary components, strain mobilities, the power method, and the number of averages. G.R.

A82-40551 # **Results of the AH-64 Structural Demonstration.** K. R. Spreuer (Hughes Helicopters, Inc., Carlsbad, CA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 481-489.

This paper presents the results of the Structural Demonstration of the AH-64 Attack Helicopter. The paper presents graphical data that shows the techniques used to attain the extreme points that define the flight envelope. The areas of the flight envelope that most challenge the various components of the helicopter are discussed. The methods used to assure flight safety during the program are also presented. Finally, the most highly loaded components are identified and the conditions and causes of the loads are presented. The Structural Demonstration was conducted successfully and all required maneuvers were performed without exceeding limit loads on any components. (Author)

A82-40552 # **Evaluation of an automatic subsystem parameter monitor.** R. V. Kurowsky and A. S. Santanelli (U.S. Army, Fort Monmouth, NJ). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 490-496.

It is pointed out that the workload of the pilot of an aircraft is not necessarily reduced by making available to the pilot a new type of avionics system architecture, if the pilot is still required to perform all the tasks he has traditionally performed. To achieve such a reduction in workload, the pilot should be used primarily as a decision maker with the ability to reprogram and command his machine in flight. The Electronic Master Monitor and Advisory Display System (EMMADS) is an information transfer system which will relieve the pilot of certain functions he has traditionally performed, such as monitoring aircraft subsystems. A description is presented of the test procedures which will be used to evaluate the operator/control/display interface of the EMMADS Advanced Development Model. G.R.

A82-40553 * # The prediction of helicopter rotor discrete frequency noise. F. Farassat (NASA, Langley Research Center, Hampton, VA) and G. P. Succi (Bolt Beranek and Newman, Inc., Cambridge, MA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 497-507. 23 refs.

An accurate prediction of the noise produced by helicopters requires a good understanding of the noise generating mechanisms involved. Such an understanding can lead to controlling the noise of existing helicopters by avoiding noisy regimes of flight or by redesigning the main and tail rotors. The present investigation is concerned with approaches which are suitable for the calculation of discrete frequency noise of helicopter rotors. The governing differential equation of acoustics used in a consideration of acoustic formulations is the Ffowcs Williams-Hawkings (FW-H) equation. Attention is given to a method reported by Farassat (1981), a method developed by Succi (1979), and a procedure discussed by Woan and Gregorek (1978). G.R.

A82-40554 # A semiempirical high-speed rotor noise prediction technique. K. R. Shenoy (Bell Helicopter Textron, Fort Worth, TX). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 508-516. 14 refs.

A semiempirical technique to predict high-speed noise of helicopter main rotors is discussed. This technique uses an existing data base, the properties of the equations governing the flow field, and empirical relationships to account for the changes in gross weight, blade chord and the blade rotational tip Mach number. The technique is verified through an application to full-scale flyover noise data and full-scale in-flight noise data. Hover test results for a model rotor are used to predict the noise levels for forward flight and are compared with wind tunnel test data. In addition, results of flow field investigations to study the effects of blade design parameters on high-speed noise and to extend the prediction technique are presented. These results are based on the flow field calculations made by using a three-dimensional, quasi-steady, full potential transonic analysis developed by NASA. (Author)

A82-40555 * # Dynamic surface measurements on a model helicopter rotor during blade slap at high angles of attack. J. E. Hubbard, Jr. and W. L. Harris (MIT, Cambridge, MA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 517-527. 16 refs. Research supported by the Massachusetts Institute of Technology; Grant No. NsG-1583.

The modern helicopter offers a unique operational capability to both the public and private sectors. However, the use of the helicopter may become severely limited due to the radiated noise generated by the rotor system. A description is presented of some of the experimental results obtained with a model helicopter rotor in an anechoic wind tunnel with regard to blade stall as a source mechanism of blade slap. Attention is given to dynamic rotor blade surface phenomena and the resulting far field impulsive noise from the model helicopter rotor at high angles of attack and low tip speed. The results of the investigation strongly implicates the boundary layer as playing an important role in blade slap due to blade/vortex interaction (BVI) in a highly loaded rotor. Intermittent stall cannot be ruled out as a possible source mechanism for blade slap. This implies that blade surface characteristics, airfoil shape and local Reynolds number may now be used as tools to reduce the resultant far-field sound pressure levels in helicopters. G.R.

A82-40556 # Helicopter model scale results of blade-vortex interaction impulsive noise as affected by blade planform. D. A. Conner and D. R. Hoad (U.S. Army, Structures Laboratory, Hampton, VA). In: American Helicopter Society, Annual Forum, 38th, Anaheim, CA, May 4-7, 1982, Proceedings. (A82-40505 20-01) Washington, DC, American Helicopter Society, 1982, p. 528-537. 21 refs.

An experimental investigation of the blade-vortex interaction impulsive noise characteristics of an advanced main rotor system for the UH-1 helicopter has been conducted. Models of both the advanced main rotor system and the standard UH-1 main rotor system were tested at one-quarter scale in the Langley 4- by 7-Meter (V/STOL) Tunnel using the General Rotor Model System (GRMS). Tests were conducted over a range of descent angles which bracketed the blade-vortex interaction phenomenon at a range of simulated flight speeds. The tunnel was operated in the open-throat configuration with acoustic treatment to improve the acoustic characteristics of the test chamber. The model data indicated that the advanced rotor system has increased the flight-scaled, LA noise produced by the UH-1 at all descent angles except where the blade-vortex interaction phenomenon was most intense for the standard UH-1 main rotor system. (Author)

A82-40561 # Research on the behavior of a turbojet engine during internal and external disturbances with respect to early recognition of damage (Untersuchungen über das Verhalten eines Turbostrahltriebwerks bei inneren und äusseren Störungen im Hinblick auf die Schadensfrüherkennung). H. Tönsköter. Aachen, Rheinisch-Westfälische Technische Hochschule, Fakultät für Maschinenwesen, Dr.-Ing. Dissertation, 1980. 215 p. 41 refs. In German.

The results of a theoretical and experimental study on the behavior of a single-wave turbojet engine during disturbances are presented. The simulated disturbances are categorized as either external or internal. The former influence flow relationships in the engine and vary their behavior, but entail no consequences for the engine parts. Damage and structural changes in the engine components are called internal disturbances. Experimentally obtained thermodynamic parameter changes are presented as volume divisions and average values. A program to calculate the stationary and dynamic operating behavior in turbojet engines is used to determine the extent to which the experimental results coincide with a one-dimensional computational procedure, and whether monitoring of operating behavior can be useful for early detection of damage. C.D.

A82-40562 # Research on an adaptive Kalman filter for solving the radar tracking problem (Untersuchung adaptiver Kalman-Filter zur Lösung des Radar-Zielverfolgungsproblems). W. Schumacher. Berlin, Technische Universität, Fachberich Verfahrenstechnik, Dr.-Ing. Dissertation, 1979. 128 p. 44 refs. In German. Research supported by the Deutsche Forschungsgemeinschaft.

The use of Kalman filters in automated air traffic control for failsafe measurement of local coordinates and speeds is discussed. Continuous and time-discrete models are constructed and an optimal filter is investigated. A sensitivity analysis is presented, followed by the design and simulation of an adaptive filter. Tracking at a one-level trajectory is discussed, and the design of an adaptive procedure is analyzed for different filter levels. C.D.

A82-40569 # Design and construction of a flexible autonomic electronic display device (Entwurf und Aufbau eines flexiblen autonomen elektronischen Anzeigegerätes). R. Frieling. Braunschweig, Technische Universität, Fakultät für Maschinenbau und Elektrotechnik, Dr.-Ing. Dissertation, 1980. 166 p. 40 refs. In German.

A compact, autonomic display device for presenting synthetic graphic images is needed for research work in the area of flight control. The device should also be suited for the presentation of dynamic processes. A device with the desired characteristics is currently not commercially available. The present investigation is concerned with the essential design criteria for the development and the construction of a display device which satisfies the considered requirements. The envisaged device consists of a microcomputer and an image element generator which contains digital differential analyzer (DDA) circuits. A detailed mathematical description of the generation of conic sections as image elements and the linear transformation of the elements provides the basis for universal employment possibilities of the device. The performance characteristics of the display device are illustrated with the aid of two examples, including an interpolation problem, and the display of data for flight control applications. G.R.

A82-40676 International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volumes 1 & 2. Edited by B. Laschka and R. Staufenbiel, New York, American Institute of Aeronautics and Astronautics, 1982. Vol. 1, 821 p.; vol. 2, 721 p. Members, $75.; nonmembers, $90. In English and French. (For individual items see A82-40677 to A82-41025)

Topics in aeronautical and aerodynamics research, development, implementation, and future directions are considered. The development and applications of Space Transportation Systems are described, and attention is also given to development programs for transport aircraft and military combat aircraft. Theoretical studies in flowfields, crew station design, and power plant materials and design are presented, along with investigations of aerodynamics, computational aerodynamics, control systems, and materials fatigue and tolerance. The uses of simulators for Orbiter pilot training, swept wings for efficient flight, and computer-controlled flight management systems are described, and examinations of vortex flows, structural dynamics, applications of composite structures, and canards are reported. M.S.K.

A82-40678 # Engineering aspects of international collaboration on Tornado. B. O. Heath (British Aerospace Public, Ltd., Co., Aircraft Group, Preston, Lancs., England). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40676 20-01) New York, tex Sheet theory. Also shown are some interesting calculations for attached-flow and vortex-flow flap hinge moments that indicate flaps utilizing vortex flow may generate less hinge moment than attached flow flaps. Finally, trailing-edge flap effects on leading-edge flap thrust potential are investigated and theory-experiment comparisons made. (Author)

A82-41004 * # **Wind-tunnel investigation of vortex flaps on a highly swept interceptor configuration.** W. E. Schoonover, Jr. (NASA, Langley Research Center, Hampton, VA) and W. E. Ohlson (Boeing Military Airplane Co., Seattle, WA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1276-1290. 15 refs.

A subsonic wind-tunnel investigation of the application of vortex flaps to a supersonic interceptor configuration is described. Experimental results are presented which indicate the aerodynamic effects of vortex-flap deflection, trailing-edge flap deflection, vortex flap chord and span, vertical stabilizers, and a highly cambered leading edge designed for attached flow. Data presented include longitudinal forces and moments, upper-surface pressure distributions, and oil- and smoke-flow visualization photographs. It is concluded that a full-span deployable vortex flap can provide a substantial performance improvement for this and other similar configurations. (Author)

A82-41005 # **Spanwise distribution of vortex drag and leading-edge suction in subsonic flow.** S. N. Wagner (München, Hochschule der Bundeswehr, Neubiberg, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1291-1301. 12 refs.

The spanwise distribution of the leading-edge suction force of wings with arbitrary planforms is calculated on the basis of a linear subsonic thin-wing theory and a study by Carlson and Mack (1980) on two-dimensional airfoil sections. The approach makes it possible to account for the effects of Mach number, Reynolds number, and wing parameters, including local thickness to chord ratio, location of the maximum wing section thickness, local leading-edge radius, and leading-edge sweep. Results obtained by the proposed method are found to be in good agreement with experimental data. V.L.

A82-41006 # **Fuselage effects in leading edge vortex flap aerodynamics.** J. F. Marchman, III and M. L. Hollins (Virginia Polytechnic Institute and State University, Blacksburg, VA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1302-1309. 8 refs.

Wind tunnel tests were conducted to determine the influence of a fuselage on the aerodynamic behavior of a 60 deg delta wing with leading edge vortex flaps. The results showed that at some combinations of angle of attack and yaw, the fuselage had a stabilizing effect on the leading edge vortices and that maximum lift is increased due to fuselage lift and added vortex stability. The fuselage did not affect the ability of vortex flaps to significantly increase the L/D of the wings. (Author)

A82-41007 # **New technology for the next generation of commercial transports - Real or imaginary.** I. S. Macdonald. In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1310-1320.

Economical, technical, financial, and legal implications associated with the needed replacement of technically and economically obsolete fleets of old commercial aircraft are examined. The discussion includes a brief review of the factors necessitating changes in aircraft fleets; a review of what aircraft and engine manufacturers have done to respond to the needs of the airlines to upgrade their fleets; new developments which will make it possible to increase the safety, efficiency, and profitability of commercial aircraft; and possible deterrents to the successful and useful implementation of new technology. V.L.

A82-41008 * # **An initial look at the supersonic aerodynamics of twin-fuselage aircraft concepts.** R. M. Wood, S. M. Dollyhigh, and D. S. Miller (NASA, Langley Research Center, Hampton, VA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1320/a-1320/h. 15 refs.

Results of two studies into the supersonic aerodynamics of twin-fuselage aircraft configurations are summarized. In the first study, a set of experimental data was obtained on a simple rectangular-wing twin-fuselage wind-tunnel model; this data was then used to evaluate prediction methods, assess favorable interference effects, and identify any unexpected or unpredictable aerodynamic phenomena. Results are presented which show that significant reductions in wave drag are possible through optimum body positioning and that existing aerodynamic prediction methods are adequate for making preliminary aerodynamic estimates. Several configuration concepts were theoretically explored in the second study, and results are presented which indicate the sensitivity of the twin-fuselage concept to various methods of integrating the aircraft components. (Author)

A82-41009 # **Reduced nonlinear flight dynamic model of elastic structure aircraft.** J. Jankovic (Beograd, Univerzitet, Belgrade, Yugoslavia). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1321-1329. 11 refs.

A flight dynamics model defined by equations of motion for the case of an unconstrained deformable body subjected to aerodynamic forces, thrust load and aircraft weight is presented, with a deformable structure represented by the finite element method. A reducing method based on the small energy and large damping characteristics of very fast modes is introduced which involves the determination of the generalized coordinate nonlinear vector transformation which can turn the basic nonlinear model to a linear one. The method of decoupling linear systems to subsystems of slow and fast models makes it possible to extract fast structural modes and find a linear dependence between generalized, transformed coordinates. A criterion for neglecting these modes is also presented. It is, finally, necessary to find the nonlinear dependence between basic generalized coordinates which leads to the reduced nonlinear model of the system. O.C.

A82-41010 # **Determination of load spectra and their application for keeping the operational life proof of sporting airplanes.** H. J. Kossira (Braunschweig, Technische Universität, Brunswick, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1330-1338.

Modern load spectrum determination techniques are applied to glass fiber-reinforced plastic (GFRP) sailplanes, with attention to the estimation of aircraft structure service life. The use of such methods in the case of sailplanes is demanded by their combined gust and maneuver load environments. The preparation of data gathered during a limited time interval by means of computers, using Markov transition matrix storage and extrapolation to the total lifetime of the sailplanes, is demonstrated. O.C.

A82-41011 # **The role of the scale parameter in service load assessment and simulation.** J. Gedeon (Budapesti Muszaki Egyetem, Budapest, Hungary). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1339-1349. 23 refs.

The integral scale L, which is a universal parameter for stationary stochastic processes and complementary to the standard deviation, sigma, must be used in conjunction with sigma and one or two other parameters which are unique to the process being described in order to compose autocorrelation and power-spectral density functions. The conversion from measured to theoretical standard deviation and vice versa in the case of atmospheric turbulence measurement and evaluation, which is restricted to a finite frequency bandwidth, is feasible by means of the dimensionless parameter comprising L and the low frequency cutoff wavenumber. L may also be used for the direct calculation of time spectra from space spectra, and it facilitates the accurate treatment of stochastic transients. O.C.

A82-41013 # **Theoretical and experimental investigation of joint-structural damping interaction for airplane construction.** I. N. Krivosic (Beograd, Univerzitet, Belgrade, Yugoslavia). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1358-1367. 14 refs.

After considering previously published joint structural damping interaction studies and possible physical models for this phenomenon, experimental results for the case of typical aircraft structures are treated by employing the same geometrical model with different types of joints between the skin, stringers and transverse elements. Separate analyses are given for rivet, bolt and adhesive joints, and the corresponding mutual influence of the amplitude on structural damping is analyzed in light of the experimental results. O.C.

A82-41014 # **Optimizing aerospace structures for manufacturing cost.** B. R. Noton (Battelle Memorial Institute, Columbus, OH). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings.

Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1358-1385.

The evolution of design/manufacturing interaction reveals the need for design methodologies to reduce aerospace systems cost. Cost-driver identification related to performance, design, materials, and manufacturing emphasizes the importance of the preliminary design phase. Data are required on designer-influenced cost elements, for example, with composites these are, hybrids, ply count, curing method, and quality requirements. A 'Manufacturing Cost/Design Guide' (MC/DG) for composite and metallic airframes, and also electronics, is discussed. Using examples of components and fuselage panels, the utilization of designer-oriented formats for relative and quantitative costs of manufacturing processes in trade-studies involving structural performance is shown. The MC/DC will also indicate potential cost savings of emerging technologies which accelerate technology transfer. (Author)

A82-41015 # **Composite structures repair.** H. Wicker (Grumman Aerospace Corp., Bethpage, NY). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1386-1392.

This paper concerns itself with the repair of composite materials on modern aircraft with particular emphasis on repair techniques and equipment for field use. The high strength to weight ratio of composites make them ideal to meet the demand for increasing the performance of military aircraft. However, with the increasing use of composite materials, a need has been created for unique repair methods. To meet the need to simultaneously apply pressure and a uniform temperature to the patch, a composite repair console and integral vacuum/-heater blanket was developed by Grumman. (Author)

A82-41016 # **Principles of achieving damage tolerance with flexible maintenance programs for new and aging aircraft.** J. Hall and U. G. Goranson (Boeing Commercial Airplane Co., Seattle, WA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1393-1405.

Boeing has developed new technology and procedures for determining flexible structural maintenance programs that meet damage tolerance regulations. Rating systems, based on past maintenance, are used to develop inspection programs to ensure timely detection of structural damage from environmental deterioration (EDR), accident (ADR), or fatigue (DTR). The inspection program consists of two phases. Initially, the program is based on evaluations for detecting corrosion, stress corrosion, and accidental damage using the EDR and ADR systems. As the fleet matures, inspection tasks for detecting fatigue damage, based on the DTR evaluations are incorporated into the program. (Author)

A82-41018 # **Intake swirl - A major disturbance parameter in engine/intake compatibility.** F. Aulehla (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1415-1424. 10 refs.

Based on theoretical considerations and primarily on experiment it is shown that all supersonic intakes of present combat aircraft produce essentially two types of swirl components of varying magnitude i.e. bulk and twin swirl. Depending on the sensitivity of the engine towards such disturbances serious engine/intake compatibility problems may arise, as for example engine surge and fan vibration. The remedial measures to overcome this problem are described and the solution of fenced intakes selected for Tornado is discussed. It is expected that this intake modification may also be of advantage for other high performance combat aircraft having similar intake configurations. Finally the relevance of dynamic total pressure distortion as prime compatibility parameter is questioned and a proposal for an improved intake disturbance simulation in engine bench tests is made. (Author)

A82-41019 # **An improved propulsion system simulation technique for scaled wind tunnel model testing of advanced fighters.** M. F. Eigenmann, P. A. Devereaux (McDonnell Aircraft Co., St. Louis, MO), and C. D. Wagenknecht (General Electric Co., Cincinnati, OH). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1425-1436. 10 refs.

In the interest of accurately evaluating interactions between inlet and nozzle flowfields and between a propulsion system and aerodynamic surfaces, in advanced fighter aircraft having highly integrated and closely coupled propulsion systems, a supersonic propulsion simulator for wind tunnel models has been developed. A digital control console system was also developed in order to match model engine operational and control requirements that approximate those of a full scale engine. Attention is given to simulator engine components and wind tunnel model installation details, along with the efficient use of the simulator test technique in the various phases of a supersonic aircraft configuration's development program. The thrust/drag accounting system employing the simulator model for studies of basic aerodynamic performance and throttle-dependent effects is flowcharted, and the corrections necessary in each case are discussed. O.C.

A82-41020 # **Low-speed characteristics of a fighter-type configuration at high angles-of-attack and sideslip.** K. Huenecke (Vereinigte Flugtechnische Werke GmbH, Bremen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1437-1444.

Force measurements and flow observations were conducted on a fighter-type configuration as an aid to understanding the complex flow phenomena occuring at high angles-of-attack, with an; without sideslip. The configuration typically was provided with a cranked delta wing of aspect ratio 2.5; leading-edge sweep of 58 deg, wing-mounted vertical tails, and all-moving canard surfaces. The results indicate that certain configurational changes, such as vertical tailplane strakes, are sufficient to eliminate an otherwise unstable roll and yaw behavior occuring at around 22 deg angle-of-attack. (Author)

A82-41021 # **Wing design for supersonic cruise/transonic maneuver aircraft.** P. B. Gingrich and E. Bonner (Rockwell International Corp., El Segundo, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1445-1453. 9 refs.

An approach to multiple-design-point tactical aircraft wing development is discussed. Requirements for proposed tactical aircraft include both efficient supersonic cruise an; acceleration and enhanced transonic maneuvering performance. A computational approach was developed to address the conflicting requirements of these conditions. The approach consists of developing two point designs: a transonic maneuver configuration with weak shocks and nearly attached flow and an optimum supersonic cruise design. A compromise is then developed in an iterative cycle which seeks to approach the point design flow quality through the use of variable camber. Computational results for representative tactical aircraft are presented to illustrate the process. Test experience is discussed to indicate the performance achieved with compromise designs relative to point-design configurations. (Author)

A82-41022 # **Analysis of jet transport wings with deflected control surfaces by using a combination of 2- and 3-D methods.** N. J. Pfeiffer (Boeing Commercial Airplane Co., Seattle, WA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1454-1458. 6 refs.

A computational technique has been developed which analyses transport wings with deflected spoilers or ailerons. It uses 2-D separated flow analysis results in a 'strip theory' fashion to provide inputs for a 3-D lifting surface method. Wing body lift and pitching moments are quantitatively predicted and calculated spanloads qualitatively match experimental results. The method is accurate and economical enough to be useful in the basic design of control systems. (Author)

A82-41023 # **Optimization of canard configurations - An integrated approach and practical drag estimation method.** I. M. Kroo and T. McGeer (Stanford University, Stanford, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1459-1469. 16 refs.

A fundamental analysis of subsonic canard configurations illustrates some of the problems associated with such designs and difficulties encountered in their optimization. A general solution for minimum induced drag as a function of span ratio, vertical gap, and relative surface lifts is presented. Stability and trim requirements, together with the system geometry then determine the total induced drag and practical conclusions follow when structural weight and stalling speed constrains are added. Required chord and twist distributions are determined, illustrating the problems associated with multiple design points. Unlike conventional configurations, the canards' geometric variables associated with optimal solutions to each of the above problems vary widely, showing great sensitivity to constraints and off-design operation. A82-41024 * # **Wind-tunnel investigation of a full-scale canard-configured general aviation aircraft.** L. P. Yip and P. F. Coy (NASA, Langley Research Center, Hampton, VA). In: International Council of the Aeronautical

The causes and effects of distortion in aircraft scanner data are reviewed and an approach to reduce distortions by modelling the effect of aircraft motion on the scanner scene is discussed. With the advent of advanced satellite borne scanner systems, the geometric and radiometric correction of aircraft scanner data has become increasingly important. Corrections are needed to reliably simulate observations obtained by such systems for purposes of evaluation. It is found that if sufficient navigational information is available, aircraft scanner coordinates may be related very precisely to planimetric ground coordinates. However, the potential for a multivalue remapping transformation (i.e., scan lines crossing each other), adds an inherent uncertainty, to any radiometric resampling scheme, which is dependent on the precise geometry of the scan and ground pattern. FIELD STUDIES OF THE AIR FORCE PROCEDURES (NOISECHECK) FOR MEASURING COMMUNITY NOISE EXPOSURE FROM AIRCRAFT OPERATIONS Final Report

R. A. Lee Mar. 1982 130 p
(AF Proj. 7231)
(AD-A113672; AFAMRL-TR-82-12) Avail: NTIS HC A07/MF A01 CSCL 20/1

This report describes the results of noise measurements at Laughlin AFB and Homestead AFB to field test the NOISECHECK equipment and procedures developed under contract by Bolt, Beranek and Newman, Inc. and Digital Acoustics Inc. NOISECHECK is the equipment and procedures used by the Air Force to spot check or validate the long term noise exposure predicted by NOISEMAP, the Air Force computer program for predicting community noise exposure from aircraft operations. The total noise exposure level at a specified location has an uncertainty associated with it whether the level is predicted or measured. The purpose of NOISECHECK is to determine the total noise exposure in terms of the Day-Night Level (DNL) metric for a specified ground location from direct measurements. NOISEMAP predicts DNL values for yearly-averaged 'busy days' aircraft operations. Therefore, the direct DNL measurements need to be normalized to this 'busy day' DNL. The NOISECHECK Procedures lead you through these normalizations in a straightforward step-by-step method. The results of the Laughlin and Homestead tests show that, with the proper data collection, the NOISECHECK procedures can validate the long-term noise exposure and explain any differences between the NOISEMAP predicted DNL values and the short term measurement DNL values. ATMOSPHERIC CHEMISTRY OF HYDROCARBON FUELS. VOLUME 2: OUTDOOR CHAMBER DATA TABULATIONS, PART 1 Final Report, Mar. 1980 - Sep. 1981

William P. L. Carter, Paul S. Ripley, Cecil G. Smith, and James N. Pitts, Jr. Tyndall AFB, Fla. AF Engineering and Services Center Nov. 1981 336 p 2 Vol.
(Contract F08635-80-C-0086; AF Proj. 1900)
(AD-A113665; AFESC/ESL-TR-81-53-V-2-P-1) Avail: NTIS HC A15/MF A01 CSCL 04/1

A total of 132 single- and multi-day outdoor environmental chamber experiments were conducted, involving nine different aviation and automotive fuels. These included the petroleum-derived JP-4 and JP-8 military aviation fuels, their shale-oil derived analogues, unleaded gasoline, diesel No. 2 fuel, and the experimental high energy cruise-missile fuels JP-10, RJ-4, and RJ-5. The program was conducted to assess the potential of these fuels to adversely affect air quality. Author

ANALYSIS OF VIBRATION INDUCED ERROR IN TURBULENCE VELOCITY MEASUREMENTS FROM AN AIRCRAFT WING TIP BOOM Final Report

Safwan H. Akkari and Walter Frost Washington NASA Jun. 1982 77 p refs
(Contract NAS8-34627)
(NASA-CR-3571; NAS 1.26:3571) Avail: NTIS HC A05/MF A01 CSCL 04B

The effect of rolling motion of a wing on the magnitude of error induced due to the wing vibration when measuring atmospheric turbulence with a wind probe mounted on the wing tip was investigated. The wing considered had characteristics similar to that of a B-57 Cambera aircraft, and Von Karman's cross spectrum function was used to estimate the cross-correlation of atmospheric turbulence. Although the error calculated was found to be less than that calculated when only elastic bendings and vertical motions of the wing are considered, it is still relatively large in the frequency's range close to the natural frequencies of the wing. Therefore, it is concluded that accelerometers mounted on the wing tip are needed to correct for this error, or the atmospheric velocity data must be appropriately filtered. Author

PROBLEMS RELATED TO THE INTEGRATION OF FAULT TOLERANT AIRCRAFT ELECTRONIC SYSTEMS

J. A. Bannister, V. Adlakha, K. Triyedi, and T. A. Alspaugh, Jr. Jun. 1982 167 p refs
(Contract NAS1-16489)
(NASA-CR-165926; NAS 1.26:165926; RTI/2094/02-02F) Avail: NTIS HC A08/MF A01 CSCL 09B

Problems related to the design of the hardware for an integrated aircraft electronic system are considered. Taxonomies of concurrent systems are reviewed and a new taxonomy is proposed. An informal methodology intended to identify feasible regions of the taxonomic design space is described. Specific tools are recommended for use in the methodology. Based on the methodology, a preliminary strawman integrated fault tolerant aircraft electronic system is proposed. Next, problems related to the programming and control of inegrated aircraft electronic systems are discussed. Issues of system resource management, including the scheduling and allocation of real time periodic tasks in a multiprocessor environment, are treated in detail. The role of software design in integrated fault tolerant aircraft electronic systems is discussed. Conclusions and recommendations for further work are included. M.G.

THE EFFECT OF BARRIERS ON WAVE PROPAGATION PHENOMENA: WITH APPLICATION FOR AIRCRAFT NOISE SHIELDING

C. V. M. Mgana and I-Dee Chang May 1982 142 p refs
(Contract NCC2-76)
(NASA-CR-169128; NAS 1.26:169128) Avail: NTIS HC A07/MF A01 CSCL 20A

The frequency spectrum was divided into high and low frequency regimes and two separate methods were developed and applied to account for physical factors associated with flight conditions. For long wave propagation, the acoustic filed due to a point source near a solid obstacle was treated in terms of an inner region which where the fluid motion is essentially incompressible, and an outer region which is a linear acoustic field generated by hydrodynamic disturbances in the inner region. This method was applied to a case of a finite slotted plate modelled to represent a wing extended flap for both stationary and moving media. Ray acoustics, the Kirchhoff integral formulation, and the stationary phase approximation were combined to study short wave length propagation in many limiting cases as well as in the case of a semi-infinite plate in a uniform flow velocity with a point source above the plate and embedded in a different flow velocity to simulate an engine exhaust jet stream surrounding the source. USE OF THE CAVITATION TUNNEL AT THE DUTCH NAVAL EXPERIMENT STATION (NSP), WAGENINGEN FOR THE DETERMINATION OF THE ACOUSTIC SOURCE STRENGTH OF PROPELLER CAVITATION [HET GEBRUIK VAN DE CAVITATIETUNNEL VAN HET NSP TE WAGENINGEN VOOR DE BEPALING VAN DE AKOESTISCHE BRONSTERKTE VAN SCHROEFCAVITATIE]

K. Verhulst 18 Aug. 1981 44 p refs In DUTCH
(Contract A72/KM/007)
(TPD-908-720; TDCK-75536) Avail: NTIS HC A03/MF A01

Experiments were performed, using a five blade model propeller, in order to investigate the possibilities of using the large NSP cavitation tunnel in the acoustical study of propeller cavitation. The influence of the hydrodynamic characteristics in the tunnel on the sound transmission to the tunnel wall was investigated. The transfer functions fluctuate strongly, even at a given water velocity or static pressure, probably due to acoustic damping in the tunnel circuit. For a turning propeller, the acoustic response of the tunnel wall due to propeller cavitation is very stable, since the degree of turbulence in the water, and thus the absorption, are very high. SOME COMMENTS ON THE PREDICTION OF FORWARD FLIGHT EFFECTS ON JET NOISE

Frank Obermeier Dec. 1981 37 p refs
(MPIS-20/1981; ISSN-0436-1199) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 8.55

How aeroacoustic sound generation in turbulent jet flow is affected by a coflowing stream is considered. Experiment shows that simply allowing for Doppler effects, applied to the sound field of a static jet which is assumed to be known, does not yield convincing results. The effects of a coaxial stream on the aerodynamics of jet flow, i.e., the effects on its characteristic length and velocity, found experimentally, are critically reviewed through the literature. Results lead to a prediction scheme for in-flight effects on jet noise. A comparison of this method with test data exhibits good agreement. Author (ESA)

FAA AVIATION FORECASTS-FISCAL YEARS 1982-1993

Feb. 1982 72 p
(AD-A114696; FAA-APO-82-2) Avail: NTIS HC A04/MF A01 CSCL 01/2

This report contains the Fiscal Years 1982 to 1993 Federal Aviation Administration (FAA) forecasts of aviation activity at FAA facilities. These include airports with FAA control towers, air route traffic control centers, and flight service stations. Detailed forecasts were made for the four major users of the national aviation system: air carriers, air taxi/commuters, general aviation and the military. The forecasts have been prepared to meet the budget and planning needs of the constituent units of the FAA and to provide information that can be used by state and local authorities, by the aviation industry and the general public. AERODYNAMICS OF AN AIRFOIL WITH A JET ISSUING FROM ITS SURFACE

D. A. Tavella and K. Karamcheti May 1982 93 p refs
(Contract NCC2-74)
(NASA-TM-84825; NAS 1.15:84825; SU-JIAA-TR-44) Avail: NTIS HC A05/MF A01 CSCL 01A

A simple, two dimensional, incompressible and inviscid model for the problem posed by a two dimensional wing with a jet issuing from its lower surface is considered and a parametric analysis is carried out to observe how the aerodynamic characteristics depend on the different parameters. The mathematical problem constitutes a boundary value problem where the position of part of the boundary is not known a priori. A nonlinear optimization approach was used to solve the problem, and the analysis reveals interesting characteristics that may help to better understand the physics involved in more complex situations in connection with high lift systems. AIRCRAFT GEOMETRY VERIFICATION WITH ENHANCED COMPUTER GENERATED DISPLAYS

J. V. Cozzolongo Jun. 1982 13 p refs
(NASA-TM-84254; NAS 1.15:84254) Avail: NTIS HC A02/MF A01 CSCL 01A

A method for visual verification of aerodynamic geometries using computer generated, color shaded images is described. The mathematical models representing aircraft geometries are created for use in theoretical aerodynamic analyses and in computer aided manufacturing. The aerodynamic shapes are defined using parametric bi-cubic splined patches. This mathematical representation is then used as input to an algorithm that generates a color shaded image of the geometry. A discussion of the techniques used in the mathematical representation of the geometry and in the rendering of the color shaded display is presented. The results include examples of color shaded displays, which are contrasted with wire frame type displays. The examples also show the use of mapped surface pressures in terms of color shaded images of V/STOL fighter/attack aircraft and advanced turboprop aircraft. Author

FLIGHT ATTENDANT INJURIES: 1971-1976

Donell W. Pollard, Earl D. Folk, and Richard F. Chandler Jan. 1982 60 p refs
(AD-A114909; FAA-AM-82-8) Avail: NTIS HC A04/MF A01 CSCL 01/2

Data from 206 reports of 377 flight attendant injuries occurring from 1971 through 1976 are summarized. These data were obtained from the Cabin Safety Data Bank of the Civil Aeromedical Institute, and are based on Federal Aviation Administration and National Transportation Safety Board accident/incident reports. Information relating to the severity and location of the injury is provided when available from original reports. Data relating to the flight condition and location in the aircraft where the injury occurred are provided. Summaries of each reported injury are included in the appendices. Author (GRA)

CRASHWORTHINESS STUDIES: CABIN, SEAT, RESTRAINT, AND INJURY FINDINGS IN SELECTED GENERAL AVIATION ACCIDENTS

William R. Kirkham, S. Marlene Wicks, and Donald Lee Lowrey Mar. 1982 24 p refs
(AD-A114878; FAA-AM-82-7) Avail: NTIS HC A02/MF A01 CSCL 01/2

This report reviews 47 survivable or partly survivable accidents investigated since 1973 by personnel from the Civil Aeromedical Institute. The accidents were reviewed for a number of features of crashworthiness and, in particular, for injuries to occupants in relation to the severity of the impact and the performance of cabin and restraint systems. Opinions were rendered by trained crash injury investigators as to the role or expected role in seats and upper torso restraints in adding to or lessening the injuries. The data support the general concepts that nonoccupiable portions of the aircraft receive greater physical damage than occupiable areas. The greatest damage to the occupiable area is to the forward portion of cockpit/cabin and the occupants have a greater chance of survival if the cockpit/cabin remains reasonably intact. Occupants seated forward in the cockpit/cabin receive greater injuries than those seated more rearward. Further, the findings suggest the seat placement or seat failure to one degree or another intensified injuries (as compared to more optimum crashworthy seats) to occupants in at least

San Diego, CA, Aug. 9-11, 1982, Paper 82-1385. 17 p. 30 refs. Grant No. NAG1-134.

A semi-empirical method based on the suction analogy is developed to predict longitudinal aerodynamics and lateral-directional characteristics of slender wings at high angles of attack, including effects of vortex breakdown. The latter is based on a correlation parameter derived from the predicted leading-edge suction distribution in the attached flow. Empirical formulas, derived from a least-square analysis of data, for the vortex-breakdown angle of attack at the trailing edge, the progression rate of breakdown points and the vortex lift recovery factor in the breakdown region are given. Comparison of predicted results with data in longitudinal aerodynamics and lateral-directional characteristics for wings exhibiting strong vortex flow shows that the present method is reasonably accurate. Explanation for peculiar lateral-directional characteristics is given. (Author)

A82-39142 * # **Lateral aerodynamics of delta wings with leading edge separation.** J. Katz (Technion - Israel Institute of Technology, Haifa, Israel). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1386*. 12 p. 23 refs. Grant No. NAGW-00218.

An unsteady vortex lattice method is presented for the calculation of the aerodynamic forces acting on lifting surfaces undergoing complex three dimensional motion. For the present case the nonsymmetric motion of a slender delta wing was considered and the resulting lateral characteristics were calculated. The flow separation line was specified along the wing leading edge and the emanating vortex sheet shape and rollup was then calculated. Numerical results are presented for the combined high angle of attack and side slip condition and for the wing constant roll and coning motions. (Author)

A82-39143 # **Analytic extrapolation to full scale aircraft dynamics.** L. E. Ericsson and J. P. Reding (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1387*. 13 p. 57 refs.

It is pointed out that the extrapolation from subscale wind tunnel data to full scale flight becomes an especially serious problem at subsonic speeds when stall is involved and at high subsonic and transonic speeds where shock-boundary layer interaction can dominate the aerodynamics. In the case of dynamic testing, valid subscale simulation is often impossible. A description is presented of an approach which provides a solution to this preliminary design dilemma. The approach makes it possible to obtain a prediction of the full scale aircraft dynamics on the basis of an analytical extrapolation from subscale test data. The considered procedure establishes analytic relationships between dynamic and static aerodynamic characteristics induced by viscous flow effects. The veracity of the analytic method is proved by predicting dynamic test results using corresponding static test data at the same subscale flow conditions. Finally, the procedure provides the input necessary for extrapolation to full scale. G.R.

A82-39190 **Fixed pattern noise correction for staring arrays in guidance systems.** D. T. Whinray (British Aerospace Public, Ltd., Co., Dynamics Group, Hatfield, Herts., England). In: Advanced infrared detectors and systems; Proceedings of the Symposium, London, England, October 29, 30, 1981. (A82-39176 19-35) London, Institution of Electrical Engineers, 1981, p. 97-101.

Infrared guided missiles of the next generation are expected to show significant advances in performance over those in current service. These advances are partly related to an employment of focal plane arrays. A size advantage is gained by the removal of the traditional scanning mirror and drive systems. The introduction of an electronic scanned array provides speed and reliability advantages and also the potential of increased sensitivity. On the other hand, focal plane arrays do present their own set of problems in the areas of testing and operation. The present investigation is concerned with some of the aspects of testing and systems implementation of charge-coupled device (CCD) readout IR focal plane arrays which operate in the long wavelength atmospheric IR window. A description is presented of the principles of operation, and hardware techniques, which have been successfully used to achieve fixed pattern noise compensation at the high speeds necessary for focal plane arrays working in the long infrared waveband. G.R.

A82-39191 **Algorithm development for infra-red air-to-air guidance systems.** P. D. Allen and J. Northfield (British Aerospace Public, Ltd., Co., Dynamics Group, Hatfield, Herts., England). In: Advanced infrared detectors and systems; Proceedings of the Symposium, London, England, October 29, 30, 1981. (A82-39176 19-35) London, Institution of Electrical Engineers, 1981, p. 102-111.

General algorithms for the overall guidance of air-to-air infra-red missiles through the acquisition, tracking and terminal phases are described. Special attention is given to the vital area of initial target detection. Two 3 x 3 spatial operators are described and their response against naturally occurring cluttered sky images is reported. An assessment of the performance of each of these operators as discriminators of simulated targets against cluttered backgrounds has been made and is reported. The surprising result that point enhancement operators give impressive results even against large targets is discussed and qualified. (Author)

A82-39194 **Target tracking using area correlation.** R. M. B. Jackson (EMI Electronics, Ltd., Hayes, Middx., England). *(NATO, AGARD, Conference on Image and Sensor Data Processing for Target Acquisition and Recognition, Aalborg, Denmark, Sept. 8-12, 1980.)* In: Advanced infrared detectors and systems; Proceedings of the Symposium, London, England, October 29, 30, 1981. (A82-39176 19-35) London, Institution of Electrical Engineers, 1981, p. 124-130.

With the increasing use of electrooptical imagers in weapon systems for aircraft, there is a need to provide an automatic track of targets of interest to relieve the operation - who may be the pilot - of this task. A description is presented of a tracking system, based on the area correlator technique, which can provide a stable and accurate track of targets for use in airborne systems in conjunction with Forward Looking Infrared Radar (FLIR) or TV imagers. It is of small size and can be built into standard format packages for installation in military aircraft. The tracking system can handle targets with a wide range of characteristics, and it can adapt automatically to magnification and target aspect changes. G.R.

A82-39245 **The system of 'objective control' (Das System der 'Objektiven Kontrolle').** K.-D. Grätzsch (Interflug Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany). *Technisch-ökonomische Information der zivilen Luftfahrt*, vol. 18, no. 1, 1982, p. 1, 2. In German.

The concept of 'objective control' was originally developed as a control procedure in connection with the failure of components and systems of aviation equipment. However, it was soon recognized that this control method could also be employed for an evaluation of flight activities which is independent of subjective considerations. This advantage and the possibility to analyze flights, on a routine basis and in a manner which cannot be foreseen by the involved persons, has considerable educational significance. The system of 'objective control' in the case of a supervision of flight activities is based on the collection of information regarding the flight with the aid of onboard and ground-based equipment. This system makes it possible to initiate corrective action as soon as shortcomings with respect to the activities of the flying personnel are recognized. G.R.

A82-39246 **Rationalization of the maintenance process for helicopter Ka-26 (Rationalisierung des Instandhaltungsprozesses für Hubschrauber Ka-26).** K. Janeczek (Interflug Gesellschaft für Internationalen Flugverkehr mbH, Leipzig, East Germany). *Technisch-ökonomische Information der zivilen Luftfahrt*, vol. 18, no. 1, 1982, p. 3-7. In German.

Since 1970, the helicopter Ka-26 has been employed in the mountainous areas of the German Democratic Republic for agricultural applications. The maintenance program is a vital part of the utilization of the helicopter. The information obtained in connection with the use of the helicopter provided an indispensable basis for an efficient, cost-effective organization of the maintenance procedures. The enhancement of the efficiency of maintenance operations made it possible to increase the performance provided by the helicopter and to improve its reliability. Attention is given to the conventional maintenance system for helicopter Ka-26, the requirements for an optimization of maintenance procedures for the helicopter in agricultural applications, the development of an optimal maintenance system, and the introduction of suitable control procedures. G.R.

A82-39247 **Minimization of the total costs incurred in the employment of passenger jet aircraft (Minimierung der Gesamtkosten beim Einsatz von Strahlverkehrsflugzeugen).** J. Wilde (Interflug Gesellschaft für Internationalen Flugverkehr mbH, Leipzig, East Germany). *Technisch-ökonomische Information der zivilen Luftfahrt*, vol. 18, no. 1, 1982, p. 8-14. In German.

A description is presented of a procedure which makes it possible to minimize the total costs for the flight of a jet airliner. The procedure makes use of an optimization method which attempts to take into consideration all factors that affect the costs of a flight. The optimization problem is discussed, taking into account the various factors which affect fuel consumption and flight time, the determination of the Mach number which will provide a cost minimum, the consideration of meteorological factors and flight path characteristics, and the computation of fuel consumption. An investigation regarding the accuracy of the optimization calculation is also conducted. After the completion of a calculation including an optimization, it is possible to determine fuel consumption, flight times, and total costs for arbitrary Mach numbers by making use of the data stored in the computer as a result of the preceding calculation. Possible cost reductions for the operation of Interflug airliners are discussed, taking into account also the price for fuel at specific airports. G.R.

A82-39248 **Instrument landing systems /ILS/ at airports of the German Democratic Republic (Instrumentenlandesysteme /ILS/ auf DDR-Flughäfen).** W. Trempler (Interflug Gesellschaft für Internationalen Flugverkehr mbH, Leipzig, East Germany). *Technisch-ökonomische Information der zivilen Luftfahrt*, vol. 18, no. 1, 1982, p. 15-20. In German.

The introduction of a new generation of landing systems of the type ILS SP-70

(System Posadki-70), provided by the Soviet industry, began with the installation of the first system of the considered type at the airport Berlin-Schönefeld in 1978. Up to March 1981, three more ILS SP-70 were installed at airports of the German Democratic Republic. The utilization of the new SP-70 systems in Berlin and Leipzig has led to an improvement of aspects of flight safety for all arriving aircraft particularly under conditions of bad weather. The SP-70 is suited for automatic approaches according to the standards of the ICAO. Details concerning the ILS principles are discussed along with the characteristics of the ILS SP-70. The ILS SP-70 utilizes the most modern technology to satisfy Category III requirements. Attention is given to ground installations, functional descriptions of system components, and antenna diagrams. G.R.

A82-39263 † **The effect of hybrid composite materials on the dynamic characteristics of helicopter rotor blades (Vliianie gibridnykh kompozitnykh materialov na dinamicheskie kharakteristiki lopastei vertoletov).** E. G. Pak, V. N. Stekol'nikov, Iu. P. Ganiushkin, R. V. Ivannikova, and V. N. Kestel'man. *Mekhanika Kompozitnykh Materialov*, May-June 1982, p. 475-479. 7 refs. In Russian.

It is shown that changes in the relationship between the rigidity and mass characteristics of helicopter rotor blades can be effected by varying the modulus of elasticity of the structural material of the spar. Hybrid composite materials make it possible to achieve this by combining in one matrix several reinforcing fillers with different physical and mechanical properties. The optimal combination is that of glass and carbon fibers. The carbon-and-glass-reinforced plastic makes it possible to increase the rigidity of the spar without changing the mass characteristics as well as to increase the fatigue strength. B.J.

A82-39275 **Application of an optical data link in the airborne scanning system.** M. J. Green (Wisconsin, University, Madison, WI). *Review of Scientific Instruments*, vol. 53, Aug. 1982, p. 1278-1280.

A scanning thermal IR radiometer has been used in the acquisition and digital processing of thermal imagery. In connection with plans for a study of oceanic thermal fronts, attention has been given to the possibility to employ the scanner in a system for mapping sea surface temperature which could be used with the Navy P-3 patrol aircraft. The main obstacle to such an employment is that, since the aircraft are to be used on an 'aircraft-of-opportunity' basis, no modifications to the aircraft would be permitted. The scanner is comprised of two principal subsystems, including the scanner head itself and a power supply/signal conditioning chassis. These two units are normally connected by a 39-conductor cable. As the requirements regarding the Navy application do not permit an employment of the normal connection, an optical data link has been fabricated which can replace the hard-wired connections between scanner head and power supply. G.R.

A82-39279 † **Primary-data devices (Pribory pervichnoi informatsii).** V. A. Bodner. Moscow, Izdatel'stvo Mashinostroenie, 1981. 344 p. 29 refs. In Russian.

The work examines the theoretical principles, design, and analysis of primary-data devices, i.e., sensors that are used to acquire information necessary for the control and monitoring of flight vehicles. Particular consideration is given to advanced measurement techniques (pulse-time and frequency output devices, correlation devices, etc.), the computer-aided design of the devices with allowance for complex optimization, the use of microprocessors, and automatic error compensation. Attention is given to sensors for measuring pressure, temperature, fuel consumption, flight speed and altitude, and acceleration. B.J.

A82-39295 † **The operation of aircraft and helicopters in difficult meteorological and environmental conditions (Ekspluatatsiia samoletov i vertoletov v uslozhnennykh prirodnykh usloviiakh).** A. M. Volodko. Moscow, Izdatel'stvo Transport, 1981. 158 p. 48 refs. In Russian.

The effects of such adverse phenomena as turbulence, ice formation and hail, wind shear, and lightning on the operation of aircraft are considered. Attention is also given to the effects of high and low air temperatures, dust in the air, and air moisture. Biological damage (from microorganisms, insects, and birds) is also considered along with conditions of helicopter flight in mountain areas and clouds. B.J.

A82-39321 **Flight management computers (Calculateurs de gestion du vol).** J. Grossin (Société Nationale Industrielle Aérospatiale, Toulouse, France). *L'Onde Electrique*, vol. 62, June-July 1982, p. 59-66. 11 refs. In French.

Flight management computers (FMC) and their role in reducing fuel consumption in commercial aircraft are examined. Research to offset rising fuel costs is concentrating on improving engine efficiency and the aerodynamic performance of the aircraft, and in flight control computers which automate control of flight and systems to the most efficient levels. Implementation of FMC with the Airbus is described, including the retrofit to provide accurate navigation and economical ascent and descent. Flight time at low speed and altitudes is minimized, and systems surveillance and fuel flow are automated. Block diagrams are presented of the systems interconnections with the FMC and the control strategy. Flight plans fed into the FMC yield an optimized flight strategy based on a plan involving lowest cost. The flight is categorized into ascent, cruise, and descent phases. Constraints which can alter the plan consist of changes in altitude to maintain proper cruise speed, the tempo of the flight in reaching fixed ground reference points, and operational limits of the aircraft. M.S.K.

A82-39322 **Electronic stabilization of an aircraft (Stabilisation d'un avion par l'électronique).** A. Chadeau (Ministère de la Défense, Service Technique des Télécommunications et des Equipements Aéronautiques, Paris, France). *L'Onde Electrique*, vol. 62, June-July 1982, p. 67-71. In French.

The applications of electronic flight control systems (EFC) to the amelioration of engine troubles and to automatic pilot systems are reviewed. Nominal instabilities are automatically corrected in-flight through commands implemented by electrohydraulic servocontrols responding to preset tolerances for the flight envelope parameters, including airspeed, altitude, pitch, route, and landing functions. EFC systems permit the use of aircraft configurations which experience instabilities which could not be handled by a human pilot, but can be electronically altered so that control of the aircraft appears similar to simple mechanical linkage. Digitized control of a modern aircraft is noted to require over 400,000 operations/sec, with control decisions being weighted toward safety through calculations of the probability of occurrence of destabilizing events and an assessment of the total effect a command decision will have on the aircraft. It is concluded that progress toward introducing new control stragegies is slow, in order to maintain the accuracy and operability of preexisting systems. M.S.K.

A82-39323 **Air-air collision avoidance systems (Systèmes d'anticollision air-air).** A. Michel (Direction Générale de l'Aviation Civile, Service Technique de la Navigation Aérienne, Paris, France). *L'Onde Electrique*, vol. 62, June-July 1982, p. 72-82. 10 refs. In French.

Methods of improving air-to-air collision avoidance through ground based actions are asserted to reside in flow control, by restricting the number of flights to levels which can be handled by available controller personnel aided by computers and radar. An on-board collision avoidance system is offered as a means to ameliorate the workload on the ground. The systems tested thus far have operated between 1520-1620 MHz and work multilaterally, obtaining identification of nearby aircraft, their relative distance, altitudes, and characterizing their approach paths. Attention is given to various systems developed as prototypes for operational systems, noting that the FAA is requiring that any system used be compatible with ATC. Characteristics of the Discrete Address Beacon System introduced in 1980 are presented, including methods for the suppression of erroneous data. Problems in perfecting the control logic for the detection systems are discussed. M.S.K.

A82-39358 # **The unsteady motion of a wing traveling at subsonic speed above a plane (Neustanovivsheesia dvizhenie kryla s dozvukovoi skorost'iu nad ploskost'iu).** E. A. Krasil'shchikova. *Revue Roumaine de Mathématiques Pures et Appliquées*, vol. 27, no. 3, 1982, p. 363-370. In Russian.

An analysis is presented of the plane-parallel flow of a compressible fluid excited by a thin wing moving at subsonic speed above a plane, the motion of the wing taken to begin from a state of rest. The aerodynamic problem is viewed as a combination of boundary value problems with a moving boundary for the two-dimensional wave equation. Each of these problems is solved by the method of integral equations in characteristic coordinates. The velocity potential is represented in recursive formulas, which make it possible to analyze the interaction of the wing and plane for arbitrary moments of time. B.J.

A82-39359 # **The rectangular wing with semiinfinite span in nonlinear theory (Der rechteckige flugel halbunendlicher spannweite in der nichtlinearen theorie).** S. Turbatu (Bucuresti, Universitatea, Bucharest, Rumania). *Revue Roumaine de Mathématiques Pures et Appliquées*, vol. 27, no. 3, 1982, p. 419-422. 10 refs. In German.

In an investigation of unsteady flow, use is made of an approach considered by Teipel (1964), Hosokawa (1964), and Ruo (1974). It is assumed that unsteady effects are superimposed on steady flow, taking into account a consideration of these effects in the first order. The concepts employed in connection with the solution of the nonlinear differential equation are similar to those used by Oswatitsch and Keune (1955) for the steady flowfield. A boundary-value problem in two parts regarding the potential of a rectangular wing with semiinfinite span in a state of harmonic oscillations is also solved, taking into consideration the case of unsteady transonic flow in a nonlinearized treatment. G.R.

A82-39374 **Optimal control application in supersonic aircraft performance.** C.-F. Lin (Michigan, University, Ann Arbor, MI). *IEE Proceedings, Part D - Control Theory and Applications*, vol. 129, pt. D, no. 4, July 1982, p. 113-117.

In the present investigation, the aerodynamic and engine characteristics of a typical lightweight high thrust/weight ratio fighter are modelled as continuous functions of a state variable, the Mach number. This approach provides the possibility for a smooth application of optimal control theory. By introducing a set of dimensionless variables, general results are obtained for an entire class of vehicles with similar physical characteristics. Numerical solutions are presented

American Institute of Aeronautics and Astronautics, 1982, p. 8-22. 11 refs.

Design features, engineering goals, and the performance envelope of the Tornado combat aircraft are described. The fighter was developed to perform air-to-ground, interdictor/strike, naval strike, reconnaissance, air superiority, interception, and training missions. The distribution of responsibilities and management authority among the organizations of the three nations which participated in the development program are outlined, along with decisions in the evolution of the design. A new engine was developed as a cost-saving measure, and the aircraft was built to ensure that no single failure would endanger flightworthiness. Easy access was also added to the Tornado systems in order to hold down repair time and costs. M.S.K.

A82-40879 # Advanced aerodynamic design for future combat aircraft. B. R. A. Burns (British Aerospace Public, Ltd., Co., Preston, Lancs., England). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 23-33.

Progress in aerodynamic design features to enhance the effectiveness and performance of combat aircraft are reviewed. Higher turning performance at subsonic and transonic speeds has been achieved through improvements in the lift/drag ratio by providing for attached flow on the upper part of the wings. The effects of wing root leading edge strakes and aeroelastic tailoring on flight performance are discussed, and methods of augmenting the turning performance by adding wing interference to the jet exhaust are considered. Pilot workload has been lowered by active flight controls, which allow full exploitation of modern aircraft flight and maneuvering envelopes, while gust alleviation has ensured stable flight during high speed, low altitude flight. Intake duct geometry has been configured to permit operation at high angles of attack and in sideslip, while an underfuselage carriage scheme has been developed which greatly reduces interference drag compared with conventional underwing carriage. M.S.K.

A82-40880 # Some aerodynamic/flightmechanic aspects for the design of future combat aircraft. P. Mangold (Dornier GmbH, Friedrichshafen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 34-43. 6 refs.

At an early project state of a future combat aircraft, designed with negative static stability, it is necessary to go through an optimization process in order to minimize the complexity and cost for the control system by avoiding undesirable aerodynamic characteristics. A careful refinement of certain parts of the configuration gives the chance to stay within the limits and to meet the criteria and goals for the desired longitudinal and lateral basic behavior. General trends, evaluated from many wind tunnel tests, are presented which show the influence of changing LEX size, shape of fuselage nose, slats, vertical tails etc. Concerning maximum attainable negative static margin one limit is set by the time to double amplitude after a gust disturbance. Looking at some typical existing and projected combat aircraft the paper discusses the fact and the consequences that the same Time To Double leads to different (attainable) static margins. (Author)

A82-40881 # Gust load alleviation on Airbus A 300. O. Sensburg, J. Becker, H. Lusebrink, and F. Weiss (Messerschmitt-Bölkow-Blohm GmbH, Munich and Hamburg, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 44-58. 15 refs.

An active gust load alleviation system for an Airbus A 300 with a 10% wing span increase is described, along with passive maneuver load alleviation. The introduction of active control systems is intended to minimize the incremental structural dynamic loads caused by span expansion or increased wing loading, especially due to gusts. The gust magnitude is assayed by a vane or differential pressure sensor in the front fuselage, weighted with a time delay for the vane to wing transit. Actuator transfer functions are introduced into the existing active flight controls to compensate fo; unsteady aerodynamic effects. A block diagram of the closed loop gust alleviation system is provided, along with linearized equations of motion of elastic aircraft with closed or open loop systems. Finally, further studies are indicated in unsteady effects in order to implement passive maneuver load alleviation. M.S.K.

A82-40882 # Calculations of transonic steady state aeroelastic effects for a canard airplane. N. Agrell and S. G. Hedman (Flygtekniska Forsoksanstalten, Bromma, Sweden). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 59-66. 5 refs. Forsvaret Materielverk *Contracts No. AU-1540;* No. AU-1691.

A transonic small perturbation potential method for calculation of the aeroelastic effects on aircraft with a canard is presented, and comparisons are made with results of earlier calculations. The equation for the disturbance potential is defined and the velocity potential is transformed into a finite difference form. Boundary conditions are formulated for subsonic and supersonic regimes and methods of treating steady state aeroelastic effects are discussed. A numerical mesh is devised using the SAAB 37 Viggen as an example and solution procedures at sub- and supersonic speeds are presented, covering the speed range of Mach 0.9-1.1. Aeroelastic deformation is calculated by balancing aerodynamic loads against interior forces. M.S.K.

A82-40883 # Computer-aided derivation of equations of motion for rotary-wing aeroelastic problems. F. Kiessling (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Aeroelastik, Göttingen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 67-77. 13 refs.

A general computer-algebra system has been applied to derive literal equations of motion for the aeroelastic behavior of rotary-wings. Inertia, elastic, structural damping, aerodynamic, and gravitational contributions are considered. Modal degrees of freedom are provided to represent elastic rotor blades. The program input comprises mainly a kinematic description of the system. A weighting scheme is used to obtain the most important terms in a consistent manner. Multiblade coordinate transformation is applied to reduce or to eliminate periodic coefficients. As output, matrices are written in FORTRAN code, which reflect the mathematical model and can be used for further numerical calculations. As an example, the suggested procedure is applied to a model of a two-bladed wind turbine mounted on an elastic tower. (Author)

A82-40884 # HAJIF-II - A program system for the dynamic analysis of aeronautical structures. G.-G. Liu and J.-J. Li (Chinese Aeronautical Establishment, Beijing, People's Republic of China). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 78-82. 17 refs.

HAJIF-II is a program system developed for the calculation of modal parameters of aircraft structures as well as flutter and gust response analyses with active control systems taken into consideration. Ninety-nine substructures, each with 7000 degrees of freedom, can be used in the calculation of modal parameters and 50 modes for the flutter and gust response analyses. Some new techniques, such as a revised hypermatrix technique, an improved algorithm of simultaneous iteration, and new methods of modal synthesis etc., were developed to improve the efficiency of the system. Typical aircraft structures were analyzed and good results were obtained. (Author)

A82-40886 # A practical approach to the incorporation of technical advances in avionics. J. D. Bannister and D. Roughton (British Aerospace Public, Ltd., Co., Aircraft Group, Brough, North Humberside, England). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 97-107.

Features of a program to design, develop, and construct an avionic system demonstrator rig for the next generation of tactical combat aircraft while taking advantage of advances in VLSI hardware are described. The VLSI-based architecture permits shared communication and displays, in addition to sensor-dedicated microprocessors. Military standard data busses can currently handle up to 31 subsystems through a common transmission line, and further determinations are needed to identify the effects of common mode failures, limitations on the amount of traffic on a bus, the effects of transmission delays, and particular links which cannot be routed through a data bus. Details of the functional aspects of pilot, system control, mission, navaids, and aircraft groups to define problem areas, goals, and method to allow an acceptable transition to VLSI-based avionics are discussed. M.S.K.

A82-40887 # Applying advanced technology to flight station design. W. R. Paden, Jr. and G. A. Sexton (Lockheed-Georgia Co., Marietta, GA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 108-117.

Efforts by Lockheed to develop a flight simulation research facility are described, including the construction of a functional pilot's desk flight station, aircraft systems, and controls expected to be in use in the 1990s. Simulators are being constructed to accommodate high resolution CRT color graphics, flat panel displays, touch panel controls, voice command and response systems, head-up displays, and electronic flight and thrust controllers. Stages in the realization process are outlined, noting current status in the design and fabrication of the simulator hardware and software. Systems under study are an appropriate color format, display formats, and advisory, caution, and warning system and cockpit display of traffic information format. Further research on the effects of introduction of the new equipment on pilot performance and on air traffic control are indicated. M.S.K.

A82-40888 # **The evolution of display formats for advanced fighters using multimode color CRT displays.** N. M. Lefritz, J. H. Tuttle, Jr. (Rockwell International Corp., El Segundo, CA), and M. J. Forte (Bendix Corp., Teterboro, NJ). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 118-131. Research supported by the Rockwell Independent Research and Development Fund.

Efforts to combine electromechanical indicators, instruments, and displays onto multimode, time-shared CRT displays (MMD) in advanced cockpit configurations for military aircraft are described. A cockpit configuration is presented in which the stick controller is situated to the right of the pilot, while the center console contains three MMDs. Color formatting was guided by goals to minimize electromechanical displays, provide the pilot with information relevant solely to a given mode of operation, have all data available at the pilot's option, use color and formats already implemented by the military, replace symbolic information with pictorial information, and employ the CRT for checklists. Procedures for completing an electronic preflight checklist are detailed, in addition to take-off, climb to cruise, emergency conditions, and landing sequences. M.S.K.

A82-40889 # **Application of advanced exhaust nozzles for tactical aircraft.** D. L. Bowers and J. A. Laughrey (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 132-141. 39 refs.

Advanced exhaust nozzles play an important role in the system design for advanced tactical aircraft and offer attractive design options which contribute to total aircraft performance. These exhaust nozzles can improve aircraft cruise performance if integrated carefully. Thrust vectoring attainable with these exhaust nozzles adds significantly to aircraft maneuver performance. STOL performance is obtained by thrust reversing or a combination of thrust reversing and thrust vectoring. The significant aircraft performance improvements which lie in advanced exhaust nozzle technology will be determined by past, ongoing and future programs investigating the best application of advanced exhaust nozzles for tactical aircraft. (Author)

A82-40890 # **Optimized 10 ton class commercial aircraft engine.** R. Laurens (SNECMA, Moissy-Cramayel, Seine-et-Marne, France). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 142-145.

The development program goals and methods for the CFM56 series engines for powering aircraft of 110 to 200 passengers into the 1990s are reviewed. The CFM56, in the 20,000 lb class, began with the F101 core. Derivatives of the engine are currently used in the DC8-60, the KC-135 tanker, and the 737. Compression ratios have been raised from 25-30:1 to 35-40:1, and the core features a low clearance compressor with rotor temperature control, variable stators on the first four stages, a high speed HP turbine, active clearance cooling in the turbine, and close turning clearances. High energy X rays are being employed to improve the clearances and survey the temperature map and cooling system. A commonality of 60% has been maintained between generations of the engine. M.S.K.

A82-40891 # **Recent advances in the performance of high bypass ratio fans.** D. J. Nicholas and C. Freeman (Rolls-Royce, Ltd., Derby, England). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 146-158. 7 refs. Research supported by the Ministry of Defence (Procurement Executive).

Theoretical and experimental techniques employed to improve the efficiency of the high tip speed fan jet engine are reviewed. Design features of high bypass ratio fans, including arrangement of the fan diffusion factors induced by the placement of the outlet guide vanes and the splitter are discussed. Overall design parameters of the RB211-22 fan are described, including factors influencing the spanwise work distribution, the outlet guide configuration, and techniques for characterizing the airflow. It was found that an optimum tip speed existed for each level of design pressure ratio. Performance tests on scale model rigs to determine the spanwise distribution, the blade element performance, and airfoil losses, were compared with actual engine operation. It is noted that laser holography, anemometry, and two- and three-dimensional numerical models were employed to identify and define the flow in test rig conditions. M.S.K.

A82-40892 # **Axisymmetric approach and landing thrust reverser impacts on usage and LCC.** J. P. Blackman, P. B. Stumbo (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH), and M. F. Eigenmann (McDonnell Aircraft Co., St. Louis, MO). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 159-167. 7 refs.

The effects on the performance of the F15-C and advanced fighters by the installation of three different types of approach and landing thrust reversers (ALTR) are reported, including projected impacts on thy life cycle costs (LCC). The aircraft were tested in mission configurations comprising a 350 nm subsonic cruise and 200 nm supersonic dash at high altitude, along with appropriate defensive maneuvers. The ALTR concepts examined included a rotating vane upstream of the nozzle throat, a translating shroud ALTR downstream of the throat, and a three-door ALTR downstream of the nozzle throat of the advanced air-to-surface vehicle. Effects were evaluated in terms of the resultant engine hot time, and cycles of use of the ALTRs in a variety of mission modes. The F15-C LCC was estimated to cost 3.8% more using the ALTR, while advanced vehicle LCCs increased 2.4-3.8%, with smallest increases occurring with downstream ALTR placement. M.S.K.

A82-40893 * # **Observations and implications of natural laminar flow on practical airplane surfaces.** B. J. Holmes (NASA, Langley Research Center, Hampton, VA) and C. J. Obara (Kentron Technical Center, Hampton, VA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 168-181. 46 refs.

The results of natural laminar flow (NLF) experiments conducted by NASA to determine if modern aircraft structures can benefit from NLF as do sailplanes are presented. Seven aircraft, ranging from a Cessna 210 to a Learjet 28/29, with relatively stiff skins were flown in production configurations with no modifications. Measurements were made of the boundary-layer laminar to turbulent transition locations on various aerodynamic surfaces, the effect of a total loss of laminar flow, the effect of the propeller slipstream on the wing boundary-layer transition and the boundary-layer profiles, the wing section profile drag, the effect of flight through clouds, and insect debris contamination effects. Favorable pressure gradients for NLF were concluded to be feasible up to a transition Reynolds number of 11 million. Laminar flows were observed in propeller slipstreams, and insects were found to cause transition 1/4 of the time. M.S.K.

A82-40894 # **Aerodynamic development of laminar flow control on swept wings using distributed suction through porous surfaces.** J. A. Thelander, J. B. Allen, and H. R. Weige (Douglas Aircraft Co., Long Beach, CA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 182-189. 8 refs.

Development of a laminar flow control system utilizing distributed suction through porous strips is reviewed. Recent improvements in electron beam perforation technology have greatly enhanced the potential for practical LFC application. The design of airfoil shapes compatible with LFC on swept wings is outlined. Boundary layer stability analysis results and determination of suction distributions are reviewed. Considerations for an operational system for protection from ice and insect contamination are noted. Results of a swept wing model test and plans for a LFC leading edge glove flight test program are reviewed. (Author)

A82-40895 # **External aerodynamic design for a laminar flow control glove on a Lockheed JetStar wing.** J. A. Bennett and L. B. Brandt (Lockheed-Georgia Co., Marietta, GA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 190-202. 34 refs.

A recent study contract for a subsonic laminar flow control (LFC) transport with a supercritical wing and recent Lockheed research are discussed as background information leading to the design of a JetStar part-span LFC glove to be flight-tested. The special design requirements needed to develop the glove and some of the problems encountered during the process are presented. The following topics are discussed: a method of simulating the interference effects of the body/pylons/nacelles on wing pressures when using an isolated-wing code, wind-tunnel testing of a JetStar model with a wing glove and correlation with theoretical glove pressures, and suction requirements for maintaining a laminar boundary layer. (Author)

A82-40896 * # **NASA research on viscous drag reduction.** R. H. Petersen and D. V. Maddalon (NASA, Langley Research Center, Hampton, VA). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 1. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 203-213. 42 refs.

Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 22 (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1470-1488. 11 refs.

As part of a broad research program to provide a data base on advanced airplane configurations, a wind-tunnel investigation was conducted in the Langley 30-by 60-Foot Wind Tunnel to determine the aerodynamic cha5 axeristics of an advanced canard-configured general aviation airplane. The investigation included measurements of forces and moments of the complete configuratio , isolated canard loads, and pressure distributions on the wing, winglet, and canard. Flow visualization was obtained by using surface tufts to determine regions of flow separation and by using a chemical sublimation technique to determine boundary-layer transition locations. Additionally, other tests were conducted to determine simulated rain effects on boundary layer transition. Investigation of configuration effects included variations of canard locations, canard airfoil sec on, winglet size, and use of a leading-edge droop on the out-board section of the wing. (Author)

A82-41025 # Wind tunnel measurements of longitudinal stability and control characteristics of primary and secondary wing configurations. H. L. Chevalier (Texas A & M University, College Station, TX). In: International Council of the Aeronautical Sciences, Congress, 13th and AIAA Aircraft Systems and Technology Conference, Seattle, WA, August 22-27, 1982, Proceedings. Volume 2. (A82-40876 20-01) New York, American Institute of Aeronautics and Astronautics, 1982, p. 1489-1494.

Low speed wind tunnel measurements of the variations in pitching moment coefficient with angle of attack are described for primary and secondary wing configurations, wing-canard combinations. Experimental results are shown for various vertical and horizontal distances between the surfaces, canard incidence angles and canard flap angles. These experimental results show that the stability is nonlinear with both angle of attack and incidence angle and as a consequence the pitching moment coefficient at zero lift is an important parameter affecting the stability at trim conditions. At high angles of attack, above canard stall, the change in pitching moment coefficients with canard incidence angle and flap angle is reduced and for some configurations the change is reversed. Results also show that wind tunnel tests, at the appropriate Reynolds Number, are needed to determine longitudinal stability and control characteristics of wing-canard combinations. (Author)

A82-41055 Monopole antenna patterns on finite size composite ground planes. C. A. Balanis (West Virginia University, Morgantown, WV) and D. DeCarlo (Naval Air Systems Command, Naval Air Test Center, Patuxent River, MD). *IEEE Transactions on Antennas and Propagation*, vol. AP-30, July 1982, p. 764-768. 9 refs.

The geometrical theory of diffraction methods is used to develop models and to predict the patterns of communications, navigation, and identification (CNI) blade antennas mounted on finite size composite ground planes. The computed patterns are found to agree extremely well with measurements. It is shown, both analytically and experimentally, that very minor differences between patterns of antennas mounted on perfectly conducting and composite ground planes appear for conductivities equal to 10,000 s/m. The anisotropy effect of the composite material on the antenna patterns is thought to be undetectable, at least within the system measuring accuracy. Therefore, perfectly conducting models can be used to analytically investigate the electromagnetic scattering properties of composite materials with conductivities equal to or greater than 10,000 s/m. C.R.

A82-41075 Heat release rate calorimetry of engineering plastics. A. L. Bridgman and G. L. Nelson (General Electric Co., Pittsfield, MA). *Journal of Fire and Flammability*, vol. 13, Apr. 1982, p. 114-134. 27 refs.

The Ohio State University Heat Release Rate Calorimeter (OSUHRRC) is examined as a means of defining the fire characteristics of engineering plastics under closely controlled and defined conditions of exposure to incident thermal radiation. The principles and operation of the OSUHRRC are described, and examples of tests are presented utilizing engineering thermographics. A typical test is described in detail, and the factors affecting the results, including reproducibility, external heat flux, and sample thickness, are examined. The improvement in fire retardancy resulting from the incorporation of flame retardants into test specimens is documented for polycarbonates. Comparisons of the results with large-scale foam box tests show the same relative rankings with respect to both temperature and smoke performance. C.D.

A82-41114 # Design of a longitudinal ride-control system by Zakian's method of inequalities. T. R. Crossley (Salford; University, Salford, England) and A. M. Dahshan (Military Technical College, Cairo, Egypt). *Journal of Aircraft*, vol. 19, Sept. 1982, p. 730-736. 36 refs.

In this paper, Zakian's method of inequalities is applied to the design of a ride-control system for a STOL aircraft. The purpose of the controller is to reduce the normal acceleration experienced by both passengers and crew. The method is based on the synthesis of a controller such that a set of performance specifications and constraints is satisfied. Controllers are designed on the basis of the characteristics of both the closed-loop step response and the closed-loop error response. It is shown that the design of a single-input, single-output controller by the method of inequalities is straightforward, and can be achieved by using a sequence of formulations until the designer is satisfied that no further improvement is necessary. (Author)

A82-41115 # Fatigue behavior of weldbonded joints. G. V. Scarich and G. R. Chanani (Northrop Corp., Aircraft Div., Hawthorne, CA). *Journal of Aircraft*, vol. 19, Sept. 1982, p. 773-780. 7 refs. Contract No. F33615-76-C-5412.

The effects of material and process variables on fatigue behavior were determined for a newly developed, low-cost weldbonding process for the assembly of durable aircraft structures. The weldbonding process involves spot-welding components through a previously applied adhesive, and then oven-curing the assembly to achieve a bonded structure. Both low-load and high-load transfer specimen geometries with each of two alloy combinations (7075-T6/7075-T6 and 2024-T3 alclad/7075-T6) were evaluated. Fatigue behavior of weldbonded specimens with different nugget sizes and different manufacturing defects was compared with that of riveted and adhesive-bonded specimens. In low-load transfer fatigue, weldbonding was better than riveting, but not as good as adhesive bonding, while in high-load transfer fatigue, weldbonding was equal to or better than riveting and adhesive bonding. (Author)

A82-41116 # Minimum induced drag of canard configurations. I. M. Kroo. *Journal of Aircraft*, vol. 19, Sept. 1982, p. 792-794. 10 refs.

Drag estimations are made for an elliptically loaded wing on an aircraft equipped with canards. An analysis of Prandtl's biplane equation, along with Monk's stagger theorem (1921), shows that a minimum induced drag occurs when the total loading is elliptical over the wing span, with lift transferred toward the outboard section of the wings. The section lift of the wing is represented as a Fourier series and a resulting lift distribution defines a minimum induced drag. Prandtl's interference factor is calculated and a nonelliptic interference factor is defined and is used to demonstrate that a substantial reduction in induced drag is possible in comparison with the elliptically loaded case. M.S.K.

A82-41117 # Estimation of the number of in-flight aircraft on instrument flight rules. N. Myerhoff and J. Garlitz (U.S. Department of Transportation, Office of Air and Marine Systems, Cambridge, MA). *Journal of Aircraft*, vol. 19, Sept. 1982, p. 794-796. FAA-supported research.

Mathematical models for estimating the instantaneous aircount (IAC) of aircraft on instrument flight rules flying over the U.S. at any moment are described. The data is gathered from the Official Airline Guide for scheduled great circle paths and projections are made for the location of aircraft at any time of day. The estimates are made independent of radar target reports and cover the regions monitored by each of the 20 air route traffic control centers on the continent. Noting that arrivals and departures are approximately equal from individual centers' jurisdiction at any moment, probabilities are generated for the presence of an aircraft in any given time interval, and a standard profile is employed in regions where a specific flight profile is unknown. Accuracy has been shown to be within 10% during peak hours. M.S.K.

A82-41140 Recommended practice for a demonstration of Nondestructive Evaluation /NDE/ reliability on aircraft production parts - Introduction to the guidelines. W. D. Rummel (Martin Marietta Aerospace; Denver, CO). *Materials Evaluation*, vol. 40, Aug. 1982, p. 922-932.

Guidelines for a demonstration of Nondestructive Evaluation (NDE) reliability on aircraft production parts have been compiled in order to promulgate recommended practices for the development of repeatable data in fracture mechanics applications. Such practices are designed to demonstrate the capabilities of various NDE methods for the detection of flaws in specific materials or parts under routine production inspection conditions. The intent of the guidelines is to define the limiting flaw size which can be detected within a given probability of detection and with a given percent of confidence in that probability. The outline presented encompasses operational requirements, the acquisition and reduction of data, and requalification procedures. O.C.

A82-41141 Evaluation of heat damage to aluminum aircraft structures. D. J. Hagemaier (Douglas Aircraft Co., Long Beach, CA). *Materials Evaluation*, vol. 40, Aug. 1982, p. 962-969. 15 refs.

Examinations of heated surface discoloration or distortion, eddy current conductivity comparison tests and hardness tests are used to evaluate the degree of heat damage incurred by aluminum alloy aircraft structures. Data from articles and reports on the exposure of 7075-T6 and 2024-T3/T4 aluminum alloy sheet materials to elevated temperatures for extended periods of time are considered, and portable hardness and eddy current test equipment for damage assessment are described with attention to significant variables affecting conductivity readings. The data presented suffice for the substantiation of a direct relationship between conductivity, hardness and strength which will allow the evaluation of heat or fire damage in heat-treatable aluminum alloys. O.C.

A82-41447 # Visual scene simulation concerning the landing of sporting aircraft in connection with investigations regarding the control and learning behavior of the pilot (Sichtsimulation der Landung von Sportflugzeugen im Hinblick auf Untersuchungen zum Regler- und Lernverhalten des Piloten). W. Heumann. Darmstadt, Technische Hochschule, Fachbereich Regelungs- und Datentechnik, Dr.-Ing. Dissertation, 1980. 268 p. 89 refs. In German. Research supported by the Deutsche Forschungsgemeinschaft.

The present investigation is concerned with the behavior of man as controller in a technical system. The object of the studies, which were conducted with the aid of a simulator providing a visual scene presentation, is the control of the longitudinal motion of a sporting aircraft during the last phases of a landing under visual flight conditions. Attention is given to the behavior of flying students, taking into account differences in the behavior of students and experienced pilots. Changes in the behavior of the student in connection with advances related to the learning process are examined. The landing simulation system employed provides a presentation of the visual environment of the pilot during the landing procedure, and, in addition, also a lateral view of the landing aircraft. This approach has certain advantages for the student from a didactic point of view. The analysis of the flight path with the aid of the simulator makes it possible to develop a basic model which is typical for a landing performed by an experienced pilot. G.R.

A82-41453 # Investigations concerned with shifting pilot activities to a higher hierarchical stage of flight control (Untersuchungen zur Verlagerung der Pilotentätigkeit auf eine höhere hierarchische Stufe der Flugführung). P. Sundermeyer. Braunschweig, Technische Universität, Fakultät für Maschinenbau und Elektrotechnik, Dr.-Ing. Dissertation, 1980. 120 p. 26 refs. In German.

Advantages and drawbacks of the automation of flight control systems are discussed, taking into account various hierarchical planes. The result of this system analysis is the concept of an aircraft guidance computer for the onboard four-dimensional flight path calculation and generation. The developed computer system becomes a component of an integrated flight guidance system. The computer makes it possible to conduct studies by which the activities to be performed by the pilot are raised to a higher level, involving the solution of coordination problems. The computer calculates possible alternatives regarding the flight path for the aircraft. The pilot makes the final decision on the basis of the information provided by the computer. In addition to performing a calculation of the flight path, the computer provides a representation of the flight path on a map display, time control information, and flight guidance activities (four-dimensional) with respect to different stages of automatization. G.R.

A82-41575 † High-sensitivity holographic plates PL-3M (Vysokochuvstitel'nye gologroficheskie plastinki PL-3M). L. Ia. Kaplun, E. F. Klimzo, and E. N. Sergeeva (Vsesoiuznyi Gosudarstvennyi Nauchno-Issledovatel'skii i Proektnyi Institut Khimiko-Fotograficheskoi Promyshlennosti, Moscow, USSR). *Zhurnal Nauchnoi i Prikladnoi Fotografii i Kinematografii*, vol. 27, July-Aug. 1982, p. 293-295. 8 refs. In Russian.

High-sensitivity holographic plates have been obtained by using spectrally sensitized ultrafine-grained emulsion with pAg = 6.8. The plates, designated PL-3M, have a light sensitivity of 100 erg/sq cm and a diffraction efficiency of 4.3%. The high-sensitivity holographic plates are currently used in research concerned with holographic interferometry of aircraft structures, development of holographic memory devices, stress and strain analysis of structures and materials, lens testing, and optical recording of analog information. V.L.

30 percent of the accidents reviewed. Upper torso restraints, in the few instances used, were beneficial, and had they been used by all occupants, would have significantly reduced the injuries. The report discusses the relation of the occupant to the seat and restraint system and the apparent benefit to be derived from a well-designed impact attenuating seat and, in particular, use of an upper torso restraint. REDUCTION AND ANALYSIS OF MODE C ALTITUDE DATA COLLECTED AT HIGH ALTITUDES OVER THE CONTINENTAL UNITED STATES Final Report, Sep. 1977 - Apr. 1978
Robert Rigolizzo Mar. 1982 101 p refs
(AD-A114655; DOT/FAA/CT-81/53; DOT/FAA/EM-82/9)
Avail: NTIS HC A06/MF A01 CSCL 01/2

This report describes the reduction and analysis of mode C altitude data collected over the en route centers of Cleveland, Ohio; Memphis, Tennessee; and Albuquerque, New Mexico. The data were gathered under the aegis of the separation standards program primarily for the study of lateral navigation performance over the continental United States at high altitudes. This study provides a procedure for estimating the vertical flight technical error as evidenced from mode C altitude data recorded at the en route centers. It does not account for basic altimeter system error or flight technical error biases and/or fluctuations that are not observable in the ground-derived mode C reported altitude. The data are fitted to six different analytical distributional forms. The effect that data quantization has on the estimation of the parameters of the distributions is examined. Then statistical tests are performed to evaluate the appropriateness of each distributional model in representing the histogram of the mode C deviations. A preliminary analysis is conducted to investigate the association between mode C altitude and aircraft environmental performance characteristics commonly utilized in evaluating separation criteria, as well as identifying aircraft attributes that are of major interest when evaluating vertical flight technical error. MAXIMIZING SOUTH CAROLINA'S AVIATION RESOURCES: IDENTIFYING POTENTIALLY PROFITABLE COMMUTER AIRLINE ROUTES, VOLUME 2
Clinton H. Whitehurst, Jr., Mark A. McKnew, Michael W. Broadway, and Gayle H. Taylor Oct. 1981 168 p refs
(Grant EDA-04-06-03042-40)
(PB82-139353; EDA-81-0132) Avail: NTIS HC A08/MF A01 CSCL 01B

The commuter airline routes within South Carolina were analyzed. It is concluded there are, in fact, a number of potentially profitable commuter airline routes between communities within South Carolina and interstate routes tying some communities in the State to medium and large hub airports. There is however, still work to be done. As communities grow in size and should air service to the State by trunk carriers decline further, it would be well worth it for a community to reevaluate its potential to support commuter service in terms of the profitability criteria outlined in this study. GRA

ANNUAL REVIEW OF AIRCRAFT ACCIDENT DATA: US GENERAL AVIATION CALENDAR YEAR 1979
5 Nov. 1981 213 p
(PB82-136250; NTSB-ARG-81-1) Avail: NTIS HC A10/MF A01 CSCL 01B

Aircraft accidents which occurred in U.S. general aviation operations during the calendar year 1979 are summarized. It includes an analysis of accident data involving an overview, types of accidents, accidental causal factors, kind of flying, and conclusions; a statistical compilation of accident information presented in the form of accident and rate tables, analytic tables, injury tables and cause/factor tables. These statistical data are divided into sections pertaining to all operations, small fixed-wing aircraft, large fixed-wing aircraft, rotorcraft, gliders, and collisions between aircraft. In 1979, there were 4,023 total general aviation accidents, 678 of which were fatal. Included in the total number of accidents are 40 collisions between aircraft. Author

AIRCRAFT FIRE SAFETY
May 1982 174 p refs Presented at AGARD Lecture Series, Oslo, 7-8 Jun 1982 and London, 10-11 Jun. 1982 and Washington, 15-16 Jun. 1982
(AGARD-LS-123; ISBN-92-835-1424-6) Avail: NTIS HC A09/MF A01

Progress in aerospace science and technology, especially pertaining to aircraft safety was reported. The goals of the international organization are to: strengthen common defense posture, improve international cooperation in research and development, provide scientific and technical advance to NATO in aerospace R&D, increase scientific and technical potential and recommend effective use of R&D capabilities. The following topics are discussed: aircraft fire mishap experience/crash fire scenario quantitation; human response to fire; aviation fuels, future outlook and impact on aircraft fire threat; fuel system protection methods; fireworthiness of transport aircraft interior systems; the development and application of a full scale wide body test article to study the behavior of interior materials during a postcrash fuel fire; aircraft postcrash fire reduction/survivability enhancement from a manufacturer's viewpoint; and aircraft postcrash fire fighting/rescue. For individual titles, see N82-29280 through N82-29287.

AIRCRAFT FIRE MISHAP EXPERIENCE/CRASH FIRE SCENARIO QUANTITATION
Thomas G. Horeff *In* AGARD Aircraft Fire Safety May 1982 6 p refs (For primary document see N82-29279 20-03)
Avail: NTIS HC A09/MF A01

Civil and military turbine aircraft accidents were reviewed. It was confirmed that the major postcrash fire hazard was caused by ignition of fuel released from wing separation failured during impact survivable accidents. General scenarios for postcrash fire hazards are described and heat flux levels and cabin airflow rates based on fuselage postcrash fire tests are suggested. Fire fatalities to fire tests are suggested. Fire fatalities to fire scenarios and fire experience data base through 1979 are related. It is concluded that the reduction of postcrash fire gives the greatest potential for improved crashworthiness and increased occupant survivability. E.A.K.

HUMAN RESPONSE TO FIRE
Stanley C. Knapp and Francis S. Knox, III *In* AGARD Aircraft Fire Safety May 1982 19 p (For primary document see N82-29279 20-03)
Avail: NTIS HC A09/MF A01

Human survival in aircraft fire was investigated. Aircraft fires and human survival in thermophysical dimensions and aircraft fire properties, chemical and toxic nature of fibres, the concept of worst credible environment, and survival time dimension derived from ground and airborne fire suppression are discussed. The epidemiology of human fire morbidity and mortality are divided into: (1) no personal protection, no prevention of fire; (2) inadequate protection, no prevention of fire; and (3) prevention of fire and good protection. Assessment techniques to select fabric for protective clothing are examined. Physical and biomedical bases to formulated strategies for the development of aircraft fire prevention and personal protection which leads to increased human survival is constructed. E.A.K.

AVIATION FUELS-FUTURE OUTLOOK AND IMPACT ON AIRCRAFT FIRE THREAT
A. V. Churchill *In* AGARD Aircraft Fire Safety May 1982 17 p refs (For primary document see N82-29279 20-03)
Avail: NTIS HC A09/MF A01

The properties of aviation turbine fuels with respect to aircraft fire safety are described. It is indicated that projections of the availability of petroleum crudes specifications for aviation turbine fuels may have to be modified to use fuels produced from shale oil, heavy oils and coal. Projections of the chemical and physical properties of future aviation fuels produced from these alternative sources are discussed and compared with present fuels. Progress on programs to develop fire safe fuels through the use of antimisting additives is also described. E.A.K.

N82-29283# Royal Aircraft Establishment, Farnborough (England). Engineering Physics Dept.
FUEL SYSTEM PROTECTION METHODS
H. W. G. Wyeth *In* AGARD Aircraft Fire Safety May 1982 16 p refs (For primary document see N82-29279 20-03)
Avail: NTIS HC A09/MF A01

A fuel system protection equipment for military aircraft and helicopters, to reduce fires and explosions which occur under combat conditions was developed. Equipments are available for fitment to civil transport for survivability enhancement. It is recommended that aircraft fire safety and crash resistance in the initial design and appropriate safety precautions taken to minimize the risk of fire and explosion both in flight and on the ground should be considered. It is concluded that fuel containment systems and antimisting fuels can reduce dynamic fuel spillage and improve occupant survivability in postcrash fire. E.A.K.

FIREWORTHINESS OF TRANSPORT AIRCRAFT INTERIOR SYSTEMS
John A. Parker and D. A. Kourtides *In* AGARD Aircraft Fire Safety May 1982 17 p refs (For primary document see N82-29279 20-03)
Avail: NTIS HC A09/MF A01

The fire worthiness of air transport interiors was evaluated. The effect of interior systems on the survival of passengers and crew in an uncontrolled transport aircraft fire is addressed. Modification of aircraft interior subsystem components which provide improvements in aircraft fire safety are examined. Three specific subsystem components, interior panels, seats and windows, offer the most immediate and highest payoff by modifying interior materials of existing aircrafts. It is shown that the new materials modifications reduce the fire hazards because of significant reduction in their characteristic flame spread, heat release, and smoke and toxic gas emissions. E.A.K.

THE DEVELOPMENT AND APPLICATIONS OF A FULL-SCALE WIDE BODY TEST ARTICLE TO STUDY THE BEHAVIOR OF INTERIOR MATERIALS DURING A POST-CRASH FUEL FIRE
Constantine P. Sarkos, Richard G. Hill, and Wayne D. Howell *In* AGARD Aircraft Fire Safety May 1982 21 p refs (For primary document see N82-29279 20-03)
Avail: NTIS HC A09/MF A01

The full scale, wide body test article was developed to study postcrash cabin fires. Applications of the C-133 article are described as follows: (1) capabilities and instrumentation; (2) derivation of fuel fire test conditions based on physical modeling and fire tests; (3) characterization of cabin fire hazards which result from exposure of wide body interior materials to external fuel fire; and (5) evaluation of effectiveness of urethane seat cushion fire blocking layers and improved cushioning materials. It is shown that cabin hazards and parameters associated with postcrash fire can be realized by use of improved materials. E.A.K.

AIRCRAFT POST CRASH FIRE REDUCTION/SURVIVABILITY ENHANCEMENT FROM A MANUFACTURER'S VIEWPOINT
T. Madgwick *In* AGARD Aircraft Fire Safety May 1982 23 p refs (For primary document see N82-29279 20-03)
Avail: NTIS HC A09/MF A01

The importance of achieving a balanced level of overall safety for flight and crash situations are outlined. Research and development in the area of external fire effects and occupant escape is evaluated. The crashworthiness requirements developed for the SST and the means of compliance are outlined. Cabin interior material combustion hazards are discussed. Visibility tests in a smoke filled cabin and the relative importance of toxicity effects in hindering escape are assessed. E.A.K.

AIRCRAFT POST-CRASH FIRE FIGHTING/RESCUE
R. Fiala *In* AGARD Aircraft Fire Safety May 1982 27 p refs (For primary document see N82-29279 20-03)
Avail: NTIS HC A09/MF A01

The correlation between specific extinguishing time and the size of the burning fuel area was calculated. The influence of fuel properties, the boiling temperature and viscosity on extinguishing efficiency of foams is described. An extinguishing technique which considers the dependence of extinguishing efficiency on the foam properties is presented. The requirements for foam monitors are shown. The break up of foam jets, produced by foam monitors is discussed. The extinguishing efficiency with the combined application of dry powder halon and foam and the advantages of a combined use when there is only a pool fire are outlined. E.A.K.

DEVELOPMENT OF FLYING QUALITIES CRITERIA FOR SINGLE PILOT INSTRUMENT FLIGHT OPERATIONS Interim Report, Sep. 1979 - May 1981
Aharon Bar-Gill, W. Barry Nixon, and George E. Miller Jun 1982 167 p refs
(Contract NAS1-15764)
(NASA-CR-165932; NAS 1.26:165932; MAE-1528) Avail: NTIS HC A08/MF A01 CSCL 17G

Flying qualities criteria for Single Pilot Instrument Flight Rule (SPIFR) operations were investigated. The ARA aircraft was modified and adapted for SPIFR operations. Aircraft configurations to be flight-tested were chosen and matched on the ARA in-flight simulator, implementing modern control theory algorithms. Mission planning and experimental matrix design were completed. Microprocessor software for the onboard data acquisition system was debugged and flight-tested. Flight-path reconstruction procedure and the associated FORTRAN program were developed. Algorithms associated with the statistical analysis of flight test results and the SPIFR flying qualities criteria deduction are discussed. N.W.

EFFECTS OF APPROACH LIGHTING AND VARIATION IN VISIBLE RUNWAY LENGTH ON PERCEPTION OF APPROACH ANGLE IN SIMULATED NIGHT LANDINGS
Henry W. Mertens and Mark F. Lewis Feb. 1982 21 p refs
(AD-A114742; FAA-AM-82-6) Avail: NTIS HC A02/MF A01 CSCL 01/2

Previous experiments have demonstrated illusions due to variations in both length and width of runways in nighttime 'black hole' approaches. Even though approach lighting is not designed to provide vertical guidance, it is possible that cues from approach lights could interact with cues from runway lighting to reduce illusions due to variation in runway size. Two experiments were conducted to evaluate the effect of approach lighting on perception of approach angle in simulated night approaches. In the first experiment, 40 pilots made simulated visual approaches to a 150- by 6,000-ft runway with and without a 3,000-ft approach light system (ALSF-2). Pilots controlled a moving runway model to produce a constant 'normal' angle of approach over the distance range of 23,000 ft to 8,000 ft from threshold. In the second experiment, 24 pilots made simulated approaches to a 150- by 6,000-ft runway which was either fully visible or which had lights of the upwind half occluded. In addition, a 1,400-ft abbreviated approach light system (SSALS) was used at three intensities. Decreasing the visible length of the runway by occulting lights of the far half increased mean generated approach angles from 2.2 deg to 2.7 deg in agreement with results of a previous experiment involving similar lengths of runways. Neither the presence of equal intensity approach lights nor uncomfortable glare from approach lights 20 times brighter than runway lights had an effect of practical significance on responses. These findings reinforce previous experimental demonstrations of the importance of runway size cues related to varying runway length, and also show that potential size cues provided by approach lights do not prevent illusions due to variations in runway size. von Geschwindigkeitsverteilungen im Vorderkantenwirbel eines Deltaflugels mit dem Laser-Doppler-Verfahren). K. Anders (Institut fur Thermodynamik der Luft- und Raumfahrt, Stuttgart, West Germany) and E. Wedemeyer (Institut von Karman de Dynamique des Fluides, Rhode-Saint-Genèse, Belgium). In: Symposium on Flows with Separation, Stuttgart, West Germany, November 23-25, 1981, Reports. (A82-38781 19-02) Cologne, Deutsche Gesellschaft fur Luft- und Raumfahrt, 1982. 11 p. In German.

It is pointed out that there are significant differences between the flow around a delta wing and the flow observed in the case of a conventional wing with a large aspect ratio. Vortex formation at the leading edges of delta wings produces nonlinear additional lift. Under certain conditions, a complete change of the form of the flowfield will occur above a part of the wing, and the vortex will burst. Pronounced turbulent mixing takes place, and the supersonic speed is significantly reduced. This reduction leads to a considerable decrease of the lift. Ludwieg (1960) has discussed a theory which explains the bursting process with an occurrence of instabilities. The present investigation is concerned with a study of leading edge vortices on the basis of Ludwieg's theory. Certain deviations of experimental data from results obtained on the basis of Ludwieg's theory can, perhaps, be explained by the unsymmetrical character of the vortex near the wall.

A82-38922 Calculation of level flow using radial grating (Berechnung der ebenen Strömung durch rotierende Radialgitter). E. M. Steck (Karlsruhe, Universität, Karlsruhe, West Germany). *(Gesellschaft für angewandte Mathematik und Mechanik, Wissenschaftliche Jahrestagung, Würzburg, West Germany, Apr. 21-24, 1981.) Zeitschrift für angewandte Mathematik und Mechanik*, vol. 62, Apr. 1982, p. T 233-T 235. In German.

A theoretical study of level flow through a rotating radial grating is conducted for the special case of ideal flow as well as for laminar flow in a high-viscosity newtonian fluid. A system of equations and correlative boundary conditions are developed in order to obtain the frictional and friction-free flow in the form of the integral values of the pressure and efficiency as functions of volume, blade number, Reynolds number, blade angle variation, and radian ratio.

A82-38937 # A recursive terrain height correlation system using multiple model estimation techniques. G. L. Mealy and W. Tang (Analytic Sciences Corp., Reading, MA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 105-112. 7 refs. Grant No. DAKK80-79-C-0266. (AIAA 82-1513)

This paper describes the results of an investigation of the performance capabilities of an extended Kalman filter (EKF) based recursive terrain correlation system proposed for low-altitude helicopter navigation. The major disadvantage of this concept is its sensitivity to initial position error. One method for reducing this sensitivity involves the use of multiple model estimation techniques. In the multiple model approach, a bank of identical EKFs, each of which is initialized at a different point in the a priori uncertainty basket, is employed to ensure that one filter is initialized near the true aircraft position. In this manner, the probability of filter convergence is increased substantially, leading to improved navigation performance.

A82-38938 # PNCS - A commercial flight management computer system. M. W. Bird (Lear Siegler, Inc., Instrument Div., Grand Rapids, MI). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 113-123. 5 refs. (AIAA 82-1515)

The Performance Navigation Computer System (PNCS), a system in which performance optimization, multisensor navigation, automatic guidance, and display techniques have been integrated to provide fuel-efficient operation and a lower workload for the crew is described. The PNCS guidance and flight planning capabilities derive from the integration of the optimum speed and altitude profiles computed by the performance management function with the lateral path and speed/altitude constraints of the flight plan. The performance management functions determine the climb, cruise, and descent profile segments that minimize the total trip cost, while lateral, vertical, and speed commands are fed to the autopilot and autothrottle for automatic guidance to the optimized profile. The navigation data base of the PNCS, which contains airport, route, and navigation aid data, simplifies the selection and modification of flight plans.

A82-38939 # Air-to-air missile avoidance. G. A. Mandt and T. L. Neighbor (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 124-131. 12 refs. (AIAA 82-1516)

A methodology for developing real-time missile avoidance trajectories is presented. The steps are as follows: analyzing missile systems for vulnerabilities, determining the tactics to exploit these vulnerabilities, and testing the tactics against missile simulations to determine the location and extent of maneuver effectiveness. It is noted that these maneuvers could then be placed into an on-board computer for real-time missile avoidance. Also presented is a table look-up approach. This approach permits maneuvering at longer ranges, appears better able to handle a multiple missile scenario as compared with an optimal control algorithms, and appears more feasible to implement.
C.R.

A82-38940 # Pilot models for discrete maneuvers. R. K. Heffley (Systems Technology, Inc., Mountain View, CA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 132-142. 17 refs. (AIAA 82-1519)

Discrete maneuvers comprise a class of piloting tasks which can include fixed-wing landing flare; gross change of heading, altitude, or airspeed; helicopter or VTOL transition to hover; and helicopter nap-of-the-earth dash and quick-stop. While these maneuvers may appear to differ fundamentally from basic tracking tasks, pilot models can be constructed using the same mathematical forms. Several examples of discrete-maneuver pilot models are presented along with accompanying flight and simulator data. The value of such models is discussed with regard to handling qualities, simulator fidelity, and pilot training. The main benefit is the ability to exploit pilot-in-the-loop analysis more effectively by formulating a complete pilot-vehicle-task context.

A82-38941 # Design and flight testing of digital direct side-force control laws. S. L. Grunwald (USAF, Washington, DC) and R. F. Stengel (Princeton University, Princeton, NJ). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 143-151. 15 refs. Contract No. N00014-78-C-0257. (AIAA 82-1521)

Three-input/three-output command augmentation control laws designed and tested in flight using Princeton University's variable-response research aircraft are discussed. It is noted that the controllers were based on algebraic model-following, a fast and efficient method of direct digital synthesis for advanced control modes. Pilot opinions of several command modes and controller-to-command pairings are presented here. Flat turns, lateral translation, and roll control are investigated. Of the command modes tested, foot pedals-to yaw rate, lateral stick-to-roll rate, and thumb lever-to-sideslip angle are found to give the best overall ratings.
C.R.

A82-38942 # Simulator investigations of various side-stick controller/stability and control augmentation systems for helicopter terrain flight. E. W. Aiken (U.S. Army, Aeromechanics Laboratory, Moffett Field, CA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 152-164. 15 refs. (AIAA 82-1522)

Two piloted simulator experiments were conducted to assess the effects of side-stick-controller characteristics and level of stability and control augmentation on handling qualities for helicopter terrain flight. A composite of several evaluation tasks was flown with the aid of a head-up display of flight-control symbology. Variations in force-deflection characteristics and the number of axes controlled through a side-stick were investigated. Satisfactory handling qualities were achieved with a two-axis displacement controller and angular rate stabilization. Attitude stabilization was required to maintain adequate handling qualities for either a three- or four-axis rigid controller.

A82-38943 * # The effects of the delays on systems subject to manual control. R. A. Hess (NASA, Ames Research Center, Moffett Field, CA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 165-172. 13 refs.

Results are presented of an experimental study to determine the effects of time delays in manual control systems. A simple, fixed-base laboratory simulation facility is used for determining pilot dynamics and tracking performance in a series of single-axis, compensatory tracking tasks. In these tasks, three time-delay values and three controlled-element dynamics are used. The delays are chosen to encompass values encountered in experimental and operational aircraft. It is noted that the controlled-element dynamics replicate those found in many previous manual control studies, that is, the classical displacement, rate, and acceleration control systems. The experimental effort is complemented with an analytical pilot modeling study where the parameters of a structural model of the human pilot are adjusted so as to provide excellent matches to the experimentally determined pilot dynamics. The experimental and analytical studies both indicate that time delays cause significant changes in pilot equalization requirements.
C.R.

A82-38944 * # Modal control of relaxed static stability aircraft. R. H. Rooney, J. C. Chung, and E. Y. Shapiro (Lockheed-California Co., Burbank, CA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 173-176. Contract No. NAS1-15326. (AIAA 82-1524)

A method is developed that assigns a selected portion of a closed loop system eigenstructure in accordance with certain desirable criteria. The method is applied here to a relaxed static stability aircraft, the goal being to synthesize a control law that provides the unstable aircraft with handling qualities equal to or better than those of a comparable statically stable aircraft. It is shown that by using the target system eigenstructure, good flight characteristics are achieved by the unstable aircraft. It is also shown that improved characteristics can be obtained by assigning an orthogonal eigenvector structure. C.R.

A82-38954 # **An X-Wing aircraft control system concept.** A. J. Potthast (Lockheed-California Co., Burbank, CA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 257-265. 13 refs. (AIAA 82-1540)

X-Wing aircraft technology development has, as an ultimate goal, a Vertical Take-Off and Landing (VTOL) aircraft with fast tactical response, long range, and high speed that can be operated from frigates and large destroyers. The proposed aircraft combines a circulation control air rotor/wing and control system with a conventional aircraft fuselage and 'fan-in-fin' tail. Cyclic and collective modulation of rotor/wing circulation control air combined with rotor/wing hub moment feedback and conventional feedback provides continuous stability and control during rotary, conversion, and fixed wing modes of flight. The control concept is described and test results from full and 1/4-scale models are compared with predicted data. Conclusions are drawn relative to concept application to the X-wing aircraft. (Author)

A82-38959 # **A design criterion for highly augmented fly-by-wire aircraft.** C. R. Abrams (U.S. Navy, Air Development Center, Warminster, PA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 410-419. 8 refs. (AIAA 82-1570)

The present investigation is concerned with a versatile control criterion for highly augmented fly-by-wire aircraft which can provide optimized mission-oriented performance. Based on an optimization process for a second order system, a Time Response Parameter (TRP) has evolved which can be adapted to a variety of mission phases and new flight modes. The TRP approach has demonstrated definite trends with both Pilot Ratings and Pilot Induced Oscillation Ratings, and is also compatible with other transient response criteria. The TRP criterion can be readily applied to high order, nonlinear, and multivariable control systems, and is easily computerized for continuous evaluation of control system design. It is pointed out that the use of such criteria will promote the utilization of military aircraft as a weapons platform through more effective flight control design. G.R.

A82-38960 # **Generic faults and design solutions for flight-critical systems.** S. S. Osder (Sperry Flight Systems, Phoenix, AZ). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 509-518. 17 refs. (AIAA 82-1595)

The term 'generic fault' is employed to describe design defects which elude the test and analysis procedures used to validate a redundant control system design. Although the existence of such defects can be postulated in any type of system, the generic fault concept is especially significant in the flight-critical system application because it defeats the massive redundancy strategies which designers rely on to meet safety or reliability objectives. Various types of generic faults are examined, taking into account computation and scaling, timing, logical errors, hardware and firmware defects, latent failure effects, and aspects of real-time clock failure. A description is presented of solutions using decoupled, nonsynchronous architectures. It is found that dissimilar redundancy and brick-wall separation strategies are viable approaches to overcome generic-fault vulnerabilities. Their implementation requires unsynchronized channel operation. G.R.

A82-38961 * # **The use of differential pressure feedback in an automatic flight control system.** D. W. Levy, J. Roskam, and P. D. Finn (Kansas University Center for Research, Inc., Flight Research Laboratory, Lawrence, KS). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 519-524. Grant No. NAG4-5. (AIAA 82-1596)

A feasibility study has been performed to evaluate the performance of a system whereby a control surface is positioned with differential pressure as the feedback variable. Analogous to a position command system, the control surface is commanded to move until a certain differential pressure is achieved at a given point on the surface. Frequency response tests and theoretical considerations indicate that the pressure feedback transfer function is first order, with a break frequency up to 50 rad/sec. There exist applications to the outer loops of flight control systems as well. Stability augmentation, gust alleviation, and stall prevention appear to be possible by feeding back differential pressure across lifting and control surfaces. (Author)

A82-38962 # **A preliminary laboratory evaluation of a reconfigurable integrated flight control concept.** A. P. DeThomas (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) and S. C. Goel (Systems Control Technology, Inc., West Palm Beach, FL). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 525-530. 5 refs. (AIAA 82-1597)

The present investigation is concerned with the concept of virtual redundancy as a means of maintaining the reliability of the flight control function within an integrated architecture. Virtual redundancy involves the reconfiguring of the system resources to create redundancy on demand. Virtual redundancy is invoked by the system executive by causing some known good processor to compute a solution which can break the tie between disagreeing processors. An implementation in software for the case of Virtual Flight Control redundancy is discussed. Attention is given to an examination of virtual redundancy as a means of fault isolation for cross-channel monitoring when only two signals are present, a general assessment of the feasibility of virtual redundancy and system reconfiguration to enhance coverage and recover function lost due to failures, redundancy management, and failure detection and isolation. G.R.

A82-38966 # **The ideal controlled element for real airplanes is not K/s.** C. R. Chalk (Calspan Corp., Buffalo, NY). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 556-560. (AIAA 82-1606)

The early experiments performed to generate data to support development of mathematical models of the human operator used simple controlled element transfer functions, including K, and K/s. However, when the physical system being controlled has mass and the response state being controlled is position, the K and K/s transfer function forms are physically impossible because infinite acceleration capability would be required for abrupt commands. It is found that the roll angular acceleration and the lateral linear accelerations at the pilot station are important considerations in flying qualities. The angular and linear accelerations can become objectionably high when the roll damping is very high and the height above the X stability axis is large. It is pointed out that roll ratchet is best explained by a model that assumes the pilot is closing the aileron loop on angular acceleration response cues. G.R.

A82-38968 # **An alternate method of specifying bandwidth for flying qualities.** J. Hodgkinson, J. R. Wood (McDonnell Aircraft Co., St. Louis, MO), and R. H. Hoh (Systems Technology, Inc., Hawthorne, CA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 571-578. 6 refs. (AIAA 82-1609)

It is pointed out that the task of predicting the flying qualities of a modern fighter aircraft has been complicated by the use of highly augmented control systems. Control systems intended to improve flying qualities have often degraded them instead. These degradations were unexpected because the criteria used to predict the aircraft's flying qualities were invalid, or were incorrectly interpreted, for augmented aircraft. Therefore, in the 'Proposed MIL Standard/Handbook - Handling Qualities of Piloted Airplanes', criteria for augmented aircraft are emphasized. The bandwidth criterion specifies the quality of aircraft attitude dynamics. A refined version of the bandwidth criterion is proposed. The new version offers two specific advantages as compared with the original version. It deals with the bandwidth sensitivity problem and, by using a Nichols chart, it encourages the designer to view the entire open- and closed-loop frequency responses simultaneously. G. R.

A82-38969 # **Investigation of low order lateral directional transfer function models for augmented aircraft.** D. E. Bischoff and R. E. Palmer (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926 19-18) New York, American Institute of Aeronautics and Astronautics, 1982, p. 579-586. 11 refs. (AIAA 82-1610)

The high order transfer functions representing the lateral directional responses of augmented aircraft to pilot control inputs were matched in the frequency domain with two candidate low order equivalent forms: (1) the complete three degree of freedom representation of roll and sideslip angle responses, and (2) the single degree of freedom roll mode and Dutch roll approximations. Acceptable models were generally obtained for both forms. Simultaneous matching of sideslip and roll angle responses and/or a priori information for the roots was required to match the full three degree of freedom forms. The equivalent system models are discussed in terms of their match statistics and their model parameters are compared against the requirements of the military flying-qualities specification. (Author)

A82-38970 * # **An analysis of a nonlinear instability in the implementation of a VTOL control system during hover.** J. M. Weber (NASA, Ames Research Center, Moffett Field, CA). In: Guidance and Control Conference, San Diego, CA, August 9-11, 1982, Collection of Technical Papers. (A82-38926

Zhestovskii, and V. Ia. Bratchik. *Problemy Prochnosti*, Aug. 1982, p. 90-93. 9 refs. In Russian.

The efficiency of various schemes and methods for analyzing plates, shells, and three-dimensional structures is examined in order to select appropriate mathematical models for incorporation into a computer-based system for designing aircraft engine rotors. It is shown that at the stage of preliminary design studies, the analysis of rotor components can be carried out in the approximation of axisymmetric plates and shells. Rotor design modules are developed which can be used within the automated design system or autonomously. V.L.

A82-42474 # **The Power Pair Locus - A preliminary design aid to select power ratings for multi-engined helicopters.** A. L. Neuburger (Pratt and Whitney Aircraft of Canada, Ltd., Longueuil, Quebec, Canada). *Canadian Aeronautics and Space Journal*, vol. 28, Mar. 1982, p. 56-64.

Multi-engine passenger carrying helicopters require an engine emergency rating whose magnitude affects the economics of the vehicle. The Power Pair Locus is introduced as an optimization tool suitable for initial vehicle/engine design iterations. It represents pairs of takeoff and emergency power and it is based on a creep wear criterion for the critical turbine blade such that engine qualification requirements are satisfied. Modification of these requirements has been explored and a 10% reduction in engine size appears feasible if only 1/4% of the endurance test time is spent at the emergency rating instead of the 4% which is currently required. For cooled blades, increased cooling tends to reduce the engine's emergency to takeoff power ratio. (Author)

A82-42504 **Use of aircraft-derived data to assist in ATC tracking systems. I - Accuracy and theoretical considerations.** H. W. Thomas and C. C. Lefas (Manchester, Victoria University, Manchester, England). *IEE Proceedings, Part F - Communications, Radar and Signal Processing*, vol. 129, pt. F, no. 4, Aug. 1982, p. 281-288. 9 refs. Research supported by EUROCONTROL.

The possible uses of currently available aircraft-derived data in assisting in radar tracking are investigated theoretically to establish the accuracies required for such data to improve the performance at present obtained from radar position measurements. For straight-line tracking, it is found that velocity measurements can be obtained by resolving TAS and heading in two axes. Such velocity measurements, however, are biased by the wind to such an extent that they are not directly useful. Even though the straight-line filter may be augmented in order to estimate the wind speed online, and accuracies obtained are not significantly better than those obtained by filtering SSR data only. For maneuvering aircraft, the results obtained suggest that maneuver tracking is possible using either roll-angle or heading measurements. It is noted that use of 'higher-order' measurements such as velocity and acceleration provide considerable benefit during turns and that their incorporation into the tracking algorithm is straightforward. C.R.

A82-42531 # **Adaptation and first cryogenic operation of T2 ONERA/-CERT wind tunnel.** R. Michel and A. Mignosi (ONERA, Centre d'Etudes et de Recherches de Toulouse, Toulouse, France). *La Recherche Aérospatiale* (English Edition) no. 2, 1982, p. 75-85. 5 refs.

A description is given of the transformation of the ONERA/CERT induction-driven transonic wind tunnel into a blowdown, cryogenic wind tunnel which employs high pressure air as a driving gas and nitrogen as a coolant. An analysis of results from the first series of low temperature tests shows that the combination of induction and cryogenics yields steady and well defined low temperature flows at transonic Mach numbers, with temperatures as low as 100 K and Reynolds numbers from 3 million to over 30 million. Attention is given to the design details of the liquid nitrogen supply and injection systems, as well as the performance levels achieved. O.C.

A82-42533 # **An optimum design of fuselage structure.** H.-L. Ding, W.-P. Chen, X.-X. Sun, and W. Fang. *Acta Mechanica Solida Sinica*, May 1982, p. 157-164. 6 refs. In Chinese, with abstract in English.

The application of the improved fully stressed design method to fuselage structure design is presented. The conventional stress and minimum gage constraints as well as the component buckling constraints are studied. For the latter, the oscillation in stress ratio redesign can be effectively damped by means of the 'under-relaxation' factor derived in this paper. In addition to the commonly used bars, panels and beams, some dummy and scalar elements are used to avoid the 'ill-condition' or an idealized model of the complex fuselage structure. The presented computer program includes adjustments to the converged design and a final structural analysis in order to improve reliability. In a sample application of the fuselage structure, the design is basically converged after only five iterations. The converged design is satisfactory and is about eleven percent lighter than the initial one. C.D.

A82-42544 **Aircraft R&D in Europe - A perspective view.** J. C. Wimpenny (British Aerospace Public, Ltd., Co., Aircraft Group, Kingston-upon-Thames, Surrey, England). *(European Pioneer's Day Conference, Toulouse, France, May 6, 7, 1982.) Aeronautical Journal*, vol. 86, Aug.-Sept. 1982, p. 243-251.

Research and development in European civil air transport is considered. It is suggested that industry growth depends primarily on fare reduction, resulting in an increased actual passenger per km figure. A high rate of product improvement implies a reasonable growth rate, but a low rate may reduce the amount of competition. If an excessive rise in fuel prices occurs, R&D will still have to be high in order to reduce direct operating cost (DOC) penalties. A high or low improvement rate for DOC can influence whether future developments are primarily reorders or new types. A steady R&D is essential in order to ensure high DOC reductions, and R&D effectiveness requires precise definition and management. R&D growth must be accompanied by improved profitability of manufacturers and operators. Air traffic management (ATM) can be a major improvement as it provides a 6% potential DOC reduction, and further investigation of ATM is needed. R.K.R.

A82-42545 **A supersonic V/STOL fighter design project.** J. P. Fielding (Cranfield Institute of Technology, Cranfield, Beds., England). *Aeronautical Journal*, vol. 86, Aug.-Sept. 1982, p. 252-258.

Students of the College of Aeronautics of the Cranfield Institute of Technology have designed a V/STOL aircraft, using carbon fiber reinforced plastic construction wherever possible. This material offers weight savings of 15% for wing type components, 16% for fuselage, and 10% for undercarriage, and a mass breakdown of the aircraft is given. The design offers improved lift characteristics for short take-off and combat as it employs a close-coupled canard arrangement. As engine intakes are on top of the rear fuselage, radar cross-section is reduced, area distribution is increased, and inlet duct volume is reduced. Wind-tunnel test of a similar configuration show promising efficiency results for such intakes. Other design considerations presented pertain to wing, fuselage, and powerplant and vertical take-off system design. Particular attention during construction was given to achieving a reduced vulnerability by performing extensive penetration calculations. It is suggested that further development of the powerplant and remote augmented lift system, and investigation of high temperature materials and insulation be done. R.K.R.

A82-42546 **The application of geometric programming to the structural design of aircraft wings.** M. B. Snell and P. Bartholomew (Royal Aircraft Establishment, Dept. of Materials and Studies, Farnborough, Hants., England). *Aeronautical Journal*, vol. 86, Aug.-Sept. 1982, p. 259-268. 6 refs.

The technique of geometric programming is applied to the design of optimum aircraft wings in the multi-spar monolithic skin configuration. Both flat and corrugated web systems are considered and design examples are given based on contemporary wing data. The present report is confined to the consideration of minimum weight design of metallic structure and the constraints are those which arise naturally from consideration of allowable stress, buckling and in some instances geometric limitations on the layout. Most of the problems solved give rise to closed form solutions while more complex problems are readily solved by computer program. (Author)

A82-42547 **Turbulence modelling - Report of a Working Party.** A. B. Haines (Aircraft Research Association, Ltd., Bedford, England). *Aeronautical Journal*, vol. 86, Aug.-Sept. 1982, p. 269-277. 21 refs.

A review of turbulence modelling for aeronautical applications is presented, and recommendations for future progress in the field are suggested. External flow viscous turbulence models are based on boundary-layer development calculations matched with an inviscid-flow solution. Boundary layer calculations derived from the Bradshaw finite difference method require the use of a Reynolds-stress (RS) turbulence model. Internal flow models have lower Reynolds numbers than external; thus, the viscous layers are thicker. Turbulence models for various engine parts such as compressors (basic integral methods), combustion chambers (k-epsilon model), and jets and propulsion installation (k-epsilon model, but with better methods to account for the fluxes of heat and water) are presented. Short-term priority tasks include speeding up computer programs, applying methods to configurations of more complex geometry, and incorporating viscous effects into inviscid methods. R.K.R.

A82-42552 **Modern compressible flow with historical perspective.** J. D. Anderson, Jr., (Maryland, University, College Park, MD). New York, McGraw-Hill Book Co., 1982. 479 p. 80 refs. $33.

The fundamentals of classical compressible flow are reviewed along with modern computational fluid dynamics and high-temperature flows. Topics discussed include integral forms of the conservation equations for inviscid flows, one-dimensional flow, oblique shock and expansion waves, quasi-one-dimensional flow, differential conservation equations for inviscid flows, and unsteady wave motion. Other topics are the velocity potential equation, linearized flow, conical flow, numerical techniques for steady supersonic flow, properties of high-temperature gases, and basic examples of high-temperature flows. V.L.

A82-42565 **Optimisation in multivariable design.** G. F. Bryant. In: Design of modern control systems. (A82-42558 21-63) Stevenage, Herts., England and New York, Peter Peregrinus, Ltd., 1982, p. 159-176. 8 refs.

Three new basic algorithms for achieving diagonal dominance are described: (1) the choice of optimal permutation of input or output variables of the plant; (2)

the optimal choice of scaling factors; and (3) the determination of a real precompensator to optimize the dominance measure of the compensated plant. A linear jet-engine model is considered as a design example. B.J.

A82-42572 **The sporty game.** J. Newhouse. Research supported by the Marshall Fund. New York, Alfred A. Knopf, 1982. 250 p. 70 refs. $15.

An episodic history of the airliner business in the era of widebody airplanes is presented. Competition in the development and marketing of big airplanes is focused on, with each of the major companies being discussed in detail, and the development of international competition emphasized. The relationship of governments to the individual companies is explored, and aspects such as comfort, safety, and aircraft size are evaluated as factors in the competition. Future prospects of the American airplane industry are assessed. C.D

A82-42574 **Automation of flight operational control in the German Democratic Republic (Automatisierung der Flugleitung in der DDR).** W. Raschke (Interflug Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany). *Technisch-ökonomische Information der zivilen Luftfahrt*, vol. 18, no. 2, 1982, p. 63-80. In German.

A description is given of the procedures and the equipment of the subsystem flight operational control of the automated transportation process control system of Interflug. Attention is given to radar data processing and radar data display complexes of Berlin-Schönefeld (Gamma-1). In connection with the employment of modern technological and technical solutions, this system represents a significant step from a manual flight control system to an automated flight control system. The factors which make the automation of flight operational control procedures necessary are examined. They are found to be largely related to a very significant increase in the number of flights which have to be considered. Operational experience regarding the Gamma-1 is also discussed, and plans for additional automation projects are outlined. G.R.

A82-42670 **Design and analysis of advanced composite structures.** R. N. Hadcock (Grumman Aerospace Corp., Bethpage, NY). In: Handbook of composites. (A82-42651 21-24) New York, Van Nostrand Reinhold Co., 1982, p. 533-556. 9 refs.

The iterative final design process in the case of advanced composite structures is generally so complex that it can only be readily accomplished by utilizing a computer. However, the process can be greatly simplified for preliminary design. The present investigation is concerned with a simplified design approach which is quite adequate for preliminary design. The preliminary design of composite structures begins with tradeoffs of the impact of using different types of construction and materials on the weight and cost of either a part or on the total structure associated with an aircraft or space vehicle. Parametric trade studies are discussed, taking into account fuselage weight savings, weight savings for rudders and flaps, weight reductions over metal airframes, and advanced design composite aircraft configurations. Attention is given to multidirectional laminate structural behavior, laminate strength under uniaxial loading, and the preliminary analysis and design of composite panels. G.R.

A82-42675 **Aerospace applications of composites.** G. Lubin and S. J. Dastin (Grumman Aerospace Corp., Bethpage, NY). In: Handbook of composites. New York, Van Nostrand Reinhold Co., 1982, p. 722-743. 16 refs.

It is estimated that within 10 years composites will comprise up to 40 percent of all aircraft structures. This is due to the fact that high performance composites are the only existing materials meeting the requirements for light weight, high strength, high stiffness and good fatigue resistance characteristic of aerospace applications. For example, a graphite composite has a tensile strength of 3.6 x 10 to the sixth in. compared with 0.8 x 10 to the sixth for aluminum, and a fatigue endurance of 80 percent of its static strength, compared with 35 percent for aluminum. Additional advantages over commonly used metals include: superior surface finish, dimensional stability, material uniformity and freedom of aerodynamic design and contouring. Current applications to spacecraft include: rocket nozzles, filament wound tanks and grid-stiffened composite panels. Applications for aircraft currently include wing skins and stabilizers, with static engine components envisioned. A.B.

A82-42722 † **Optimal stream surfaces in supersonic three-dimensional flows (Ob optimal'nykh poverkhnostiakh toka v sverkhzvukovykh prostranstvennykh techeniiakh).** M. P. Levin. *Zhurnal Vychislitel'noi Matematiki i Matematicheskoi Fiziki*, vol. 22, July-Aug. 1982, p. 1003-1008. 9 refs. In Russian.

A numerical solution is obtained for the optimal contouring of the supersonic part of a three-dimensional nozzle in the case when the adjoint problem for the Lagrange multipliers has an analytical solution. Attention is given to the cases of smooth stream surfaces and to cases when the optimality conditions are formulated on the characteristic control surface. The contouring problem is reduced to the solution of a three-dimensional nonlinear system of hyperbolic equations. B.J.

A82-42750 **Europe's best seller - Second-generation Airbus emerges.** *Air International*, vol. 23, Sept. 1982, p. 111-115, 116, 118, 147, 148.

The Airbus A310 is discussed, revealing extensions and modifications of the current design. Intended as a smaller capacity short/medium range transport, it has wide-body twin aisle cabins accomodating between 220-262 passengers, depending on cabin configuration. The basic model employs two turbofan engines with 22,680kgp each, and has an operating range that varies from 1,250-2,800 naut miles. Another model having a range of 3,750 naut miles and accomodating 218 passengers is likely to be introduced. Changes made in the wing design represent an extension of ideas about supercritical airfoils and peaky sections employed in the A300 wing. The main improvement is that the shock wave has been pushed back along the chord of the wing, delaying the compressibility drag rise and increasing rear loading, giving a substantial increase in the lift carried by the wing. While the span and the sweepback remain unchanged, the aspect ratio was increased from 7.73 to 8.8. As a result of improved wing efficiency, engine efficiency and lower aircraft weight, the A310 is 21 percent more fuel efficient than its predecessor. Airbus claims that the A310 will carry more passengers and cargo at lower costs than the Boeing 767, but sales figures to date show 311 767's ordered vs 183 A310's ordered. Flight testing, begun in April 1982, is expected to lead to certification in Europe in March 1983. A.B.

A82-42791 # **Passive aircraft location.** J. L. Leva (Mitre Corp., Bedford, MA). *Astronautics and Aeronautics*, vol. 20, Sept. 1982, p. 52, 53.

Results of a study of systems equations and fabrication of a test passive ground-based aircraft detection system are presented. Discrimination abilities of the system are noted to include accuracy in a noisy environment, sorting out aircraft emissions, and time-difference-of-arrival signal processing. A civilian Mark X signal transponder was employed as the test emitter, while sensors were spread on the ground with a 10-25 n mi separation. Measurements were made of pulse time of arrival, amplitude, and frequency, and fed to the sorting algorithms. Synchronization was established between the sensors using rubidium frequency standards. It was shown that the passive system could measure the signal time of arrival, frequency, and the direction of arrival, even if the aircraft were approaching in a line. M.S.K.

A82-42792 * # **Bonding procedure for Teflon seals.** S. R. Barringer, T. E. Ezell, Jr., A. B. Stacey, Jr., and D. B. Wright, Jr. (NASA, Langley Research Center, Hampton, VA). *Astronautics and Aeronautics*, vol. 20, Sept. 1982, p. 53.

Material and bonding procedures designed for use as seals at the National Transonic Facility at the NASA Langley Research Center are presented. Teflon TFE was chosen for its ability to withstand pressures of up to 130 psi and temperatures ranging from -320 to 150 F, in addition to tolerances of 0.074 in. and having a movement allowance of 0.75 in. during transient cycles. Since some of the seals are 14 in. in diameter, Teflon sheets had to be sliced and bonded together after machining to size, resulting in seals with circular, oval, straight, and rectangular cross sections. Step-by-step preparation procedures are provided, and it is noted that the scarf joints performed as predicted during tests. M.S.K.

A82-42808 # **An experimental examination of compressor blade flutter (Etude expérimentale du flottement d'aubes de compresseurs).** E. Szechenyi (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Société Française des Mécaniciens, Réunion sur Alimentation des Turbomachines - Difficultés et Remèdes, Paris, France, May 4, 5, 1982.)* ONERA, *TP* no. 1982-31, 1982. 11 p. In French.

Experimental methods and results of ONERA trials to determine ways to eliminate feed-induced flutter of axial compressor blades are described. A general equation for the flutter induced on a blade is defined, showing that two cases of instability exist; conditions when the aeroelastic force cancels the stiffness of the blades, and when the total damping is negative and amplitude of vibration increases to the rupture point. Operation of a wind tunnel with rectilinear blades at vibration frequencies between 0-500 Hz are reviewed, noting that flows between Mach 0.5 to Mach 1.0 have been examined. Hydraulic actuators initiate the vibratory movement of the pressurized air flow, and pressure measurements recorded the magnitude and characteristics of the turbulence. It has been demonstrated that in sub- and transonic regimes the angle of attack and stable vibration frequencies are dominant factors governing the onset of vibration. When no instabilities are present, conditions of an unstable feed flow are noted to be responsible for the appearance of flutter. M.S.K.

A82-42809 # **Aeroelastic equilibrium of a helicopter rotor in the presence of nonlinear aerodynamic forces (Equilibre aéroélastique d'un rotor d'hélicoptère en presence de forces aérodynamiques non linéaires).** J.-J. Costes (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(NATO, AGARD, Meeting on Prediction of Aerodynamic Loads on Rotorcraft, London, England, May 17-19, 1982.)* ONERA, *TP*, no. 1982-33, 1982. 22 p. 13 refs. In French.

A computer code for the aeroelastic coupling of a helicopter rotor, taking into account stall conditions around the retreating blade, is presented. Quasi-linear forms are developed for nonlinear lift functions, and the aerodynamics are based on the acceleration potential in a compressible fluid. Consideration is given to all quantitatively delineates: the vast differences in electromagnetic behavior exhibited by the principle composite materials (Graphite/epoxy & Kelvar), how to predict these different properties based on the materials intrinsic electrical properties (conductivity, permeability and permittivity) and how the airframe shape influences electromagnetic coupling. The electromagnetic threats of lightning electromagnetic pulse (LEMP), nuclear Electromagnetic pulse (NEMP). Author (GRA)

The work concerned in this report spans the three-year period commencing 15 September 1978 and deals with the development of electronic instrumentation for rocket and balloon-borne quadrupole ion mass spectrometers. Electronic packages containing circuits to control the quadrupole filters and data processing were developed for sounding rockets launched from Red Lake, Ontario, Canada during the 26 February 1979 Solar Eclipse; from the Poker Flat Research Range, Chatanika, Alaska during 1980 and 1981 Solar Proton Event Programs and also the 1981 Auroral E Program. A microprocessor-based control system was developed for a balloon-borne mass spectrometer. This latter system also provides a two-way communications link for ground control of the experiment and data transmission during the flight. Author (GRA)

TITANIUM SURFACE TREATMENTS FOR ADHESIVE BONDING Phase Report
S. R. Brown and G. J. Pilla 31 Mar. 1982 50 p refs
(WF61542001)
(AD-A114710; NADC-82032-60) Avail: NTIS HC A03/MF A01 CSCL 13/8

The aircraft industry prepares titanium surfaces for adhesive bonding using various types of abrasive, etchant, chemical, and anodize treatments. A study was made to determine pretreatment effects on adhesive bond durability of titanium under severe environmental conditions of temperature, humidity, and stress. Replicate sets of Ti-6Al-4V titanium specimens were provided to aircraft manufacturers who prepared the sets using eleven different pretreatment processes. The manufacturers also bonded the specimens with the same four adhesive systems. Wedge specimens, bounded from 0.150-inch thick Ti-6Al-4V titanium were tested in a 140 F, 100% relative humidity atmosphere for a period of eight weeks. Chromic acid anodize, alkaline etch, chromate-fluoride and alkaline peroxide treatments resulted in substantially lower crack growth rates than phosphate-fluoride treatments. There was a slight difference in performance ranking of bonding pretreatments depending upon the adhesive system used. Author (GRA)

STUDIES OF NEW PERFLUOROETHER ELASTOMERIC SEALANTS Final Contractor Report, 1 Oct. 1980 - 26 Sep. 1981
D. I. Basiulis and D. P. Salisbury Sep. 1981 105 p refs
(Contract NAS2-10334)
(NASA-CR-166377; NAS 1.26:166377; Rept-76-966; FR-81)
Avail: NTIS HC A06/MF A01 CSCL 11A

Channel and filleting sealants were developed successfully from cyano and diamidoxime terminated perfluoro alkylene ether prepolymers. The prepolymers were polymerized, formulated and tested. The polymers and/or formulations therefrom were evaluated as to their physical, mechanical and chemical properties (i.e., specific gravity, hardness, nonvolatile content, corrosion resistance, stress corrosion, pressure rupture resistance, low temperature flexibility, gap sealing efficiency, tensile strength and elongation, dynamic mechanical behavior, compression set, fuel resistance, thermal properties and processability). Other applications of the formulated polymers and incorporation of the basic prepolymers into other polymeric systems were investigated. A cyano terminated perfluoro alkylene oxide triazine was formulated and partially evaluated. The channel sealant in its present formulation has excellent pressure rupture resistance and surpasses present MIL specifications before and after fuel and heat aging. S.L.

THE INTERACTION OF RADIO FREQUENCY ELECTROMAGNETIC FIELDS WITH ATMOSPHERIC WATER DROPLETS AND APPLICATIONS TO AIRCRAFT ICE PREVENTION Thesis
Robert John Hansman, Jr. Jun. 1982 193 p refs
(Grants NAG1-100; NGL-22-009-640)
(NASA-CR-169246; NAS 1.26:169246; FTL-R82-5) Avail: NTIS HC A09/MF A01 CSCL 20N

The feasibility of computerized simulation of the physics of advanced microwave anti-icing systems, which preheat impinging supercooled water droplets prior to impact, was investigated. Theoretical and experimental work performed to create a physically realistic simulation is described. The behavior of the absorption cross section for melting ice particles was measured by a resonant cavity technique and found to agree with theoretical predictions. Values of the dielectric parameters of supercooled water were measured by a similar technique at lambda = 2.82 cm down to -17 C. The hydrodynamic behavior of accelerated water droplets was studied photograhically in a wind tunnel. Droplets were found to initially deform as oblate spheroids and to eventually become unstable and break up in Bessel function modes for large values of acceleration or droplet size. This confirms the theory as to the maximum stable droplet size in the atmosphere. A computer code which predicts droplet trajectories in an arbitrary flow field was written and confirmed experimentally. The results were consolidated into a simulation to study the heating by electromagnetic fields of droplets impinging onto an object such as an airfoil. It was determined that there is sufficient time to heat droplets prior to impact for typical parameter values. Design curves for such a system are presented. J.D.

UTILIZATION OF AN/APS-94 SIDE-LOOKING AIRBORNE RADAR SYSTEMS IN SEARCH AND RESCUE Interim Report, Jan. 1978 - Apr. 1982

S. R. Osmer, L. Nash, G. L. Hover, and T. J. Mazour Apr. 1982 23 p refs
(Contract DTCG39-81-C-80287)
(AD-A114484; USCG-D-14-82; CGR/DC-3/82) Avail: NTIS HC A02/MF A01 CSCL 17/9

Since September 1978, side-looking airborne radar (SLAR) detection data have been gathered in conjunction with visual detection experiments conducted by the U.S.C.G. R&D Center. These are part of a series of experiments designed to improve search planning guidance contained in the National Search and Rescue Manual. HC-130 aircraft, equipped with either the Airborne Oil Surveillance system (AOSS) or SLAR/radar image processor (SLAR/RIP) configuration of the AN/APS-94C or D SLAR, conducted controlled searches for life rafts, small boats, and 41-to 95-foot Coast Guard vessels. Through the use of a microwave tracking system and SLAR data, the positions of searchers and targets were accurately reconstructed to facilitate the verification of detections on SLAR films or video tape. These data were used to evaluate the effects of environmental and controllable parameters on SLAR detection of the various target types. Of the 12 parameters investigated, target size/composition, search altitude, swell height, wind speed, and humidity/precipitation were found to have a significant influence on SLAR detection performance. Sweep widths for SLAR search and recommendations for SLAR utilization in SAR missions are included. In addition, recommendations for future SLAR evaluation are made. Author (GRA)

NEAR FIELD ANALYSIS OF AIRBORNE ANTENNAS Final Report

W. D. Burnside and N. Wang Dec. 1981 33 p refs
(Contract N00019-80-C-0593)
(AD-A115074; ESL-713321-4) Avail: NTIS HC A03/MF A01 CSCL 09/5

The radiation pattern analysis of the prolate spheroid based on the efficient UTD and geodesic solutions developed at least partially under previous NASC contracts has been combined with the flat plate scattering analysis in order to simulate complex airborne structures. This includes the junction edge scattering which results at the union between the fuselage (prolate spheroid) and flat plate. This solution is being verified by comparisons with various airborne antenna configurations. In addition, the geodesics for an ellipsoid have been found using a perturbation theory similar to that used for the prolate spheroid. This new ellipsoid configuration will be used to represent the fuselage in future simulation analyses. Author (GRA)

THE EFFECT OF RADOME SCATTERING ON ECM ANTENNA PATTERNS M.S. Thesis

Robert K. Schneider Dec. 1981 150 p refs
(AD-A115517; AFIT/GE/EE/81D-52) Avail: NTIS HC A07/MF A01 CSCL 17/9

The problem of scattering by thin cylindrical dielectric shells of large circular cross sections is approached by two methods: (1) an infinite series of eigenfunctions, and (2) the method of moments. Numerical results are presented for shell radii of 0.3 lambda, 3.0 lambda, and 30 lambda, the source being an electric line current near but external to the shell. Computer programs are presented which implement these two solutions. When the scattering structure does become large limitations on numerical results are encountered due to computer memory and speed limitations. Author (GRA)

DATA ACQUISITION SYSTEM FOR NASA LARC IMPACT DYNAMICS RESEARCH FACILITY

Royce F. McCormick, Jack C. Spears, James W. Lynch, and Frank R. Batten Jun. 1982 13 p
(NASA-TM-84510) Avail: NTIS HC A02/MF A01 CSCL 14B

A data system is designed to permit the simultaneous recording of 90 data channels on one 28 track magnetic tape recorder using a constant bandwidth FM multiplexing technique. Dynamic signals from transducers located in the test aircraft are amplified and fed to voltage controlled oscillators where they are converted to discrete FM signals. The signals from each group of five VCO's are fed to a mixer/distribution amplifier where they are combined into one composite signal and recorded, using direct recording techniques, on one magnetic tape recorder track. Millivolt signals from the recorders reproduce heads are amplified to one volt and then electronically switched to an FM demultiplexing system where appropriate frequency discrimination and signal filtering recover the original analog information. FLOW CONTROL FOR A HIGH ENERGY LASER TURRET USING TRAPPED VORTICES M.S. Thesis

James Edward Burd Dec. 1981 101 p refs
(AD-A115263; NPS67-81-017) Avail: NTIS HC A06/MF A01 CSCL 20/5

The Department of Defense is concerned with the viability of an airborne high energy laser system. The laser is housed in a blunt turret atop a NKC-135 aircraft. Turbulence generated by flow separation around the turret causes optical distortion of the laser beam. Control of flow separation is needed to improve laser beam performance especially for aft-aimed turrets. One technique proposed for flow control is a fairing design which will stabilize shed vortices by suction. A two dimensional computer model was used to design a fairing compatible with present test equipment. Experimental research of this fairing design was conducted in wind tunnel tests. Although flow mapping demonstrated improved flow performance through the use of suction, total quiescent flow was never achieved. A more adequate three dimensional model is needed to design a fairing that will stabilize trapped vortices. GRA

GAS FOIL BEARING DEVELOPMENT PROGRAM Final Report, 1 Jul. 1979 - 28 Feb. 1981

Francis J. Suriano Wright-Patterson AFB, Ohio AFWAL Sep. 1981 135 p
(Contract F33615-79-C-2037; AF Proj. 3048)
(AD-A114692; Rept-31-4089; AFWAL-TR-81-2095) Avail: NTIS HC A07/MF A01 CSCL 13/9

This document presents the final technical report for the nineteen-month gas foil bearing development program. The 3.5-inch foil bearing design was analyzed using an elasto-hydrodynamic analysis program. Bearing configurations with 10 and 8 foils were identified as having the potential to exceed the performance of the 12-foil GTCP165 APU bearing. A total of six bearing configurations were tested, two ambient temperature configurations using Teflon-S coated foils with a chrome-plated journal, and four with high-temperature foil and journal coatings. The high-temperature bearings used foil coatings Kaman DES, Kaman DES + au, Co-20 Ni, and TiC, all of which were run with a Kaman SCA-coated journal. Program goals were met with both ambient-temperature bearing configurations and Kaman SCA versus Kaman DES and TiC high-temperature configurations. GRA

STRUCTURES AND DYNAMICS DIVISION RESEARCH AND TECHNOLOGY PLANS, FY 1982

Kay S. Bales Jun. 1982 56 p
(NASA-TM-84509; NAS 1.15:84509) Avail: NTIS HC A04/MF A01 CSCL 20K

Computational devices to improve efficiency for structural calculations are assessed. The potential of large arrays of microprocessors operating in parallel for finite element analysis is defined, and the impact of specialized computer hardware on static, dynamic, thermal analysis in the optimization of structural analysis and design calculations is determined. General aviation aircraft crashworthiness and occupant survivability is also considered. Mechanics technology required for design coefficient, fault tolerant advanced composite aircraft components subject choice of analytical methods. The components available are rigid blade rotor, elastic fuselage, rotor control system, and other structures representable by general linear second-order differential equations. The force methods available are linear rotor loads, tabular rotor aerodynamics with optional induced velocity map, fuselage flat plate drag, and sinusoidal shaker. The solution methods available are time history, linear constant coefficient eigenanalysis, and complex frequency response. The program has the capability of being expanded in its level of complexity by the addition of other technology modules. Author (GRA)

THE NOISE IMPACT OF PROPOSED RUNWAY ALTERNATIVES AT CRAIG AIRPORT

Richard DeLoach Jun. 1982 36 p refs
(NASA-TM-84503; NAS 1.15:84503) Avail: NTIS HC A03/MF A01 CSCL 20A

Four proposed runway expansion alternatives at Craig Airport in Jacksonville, Florida have been assessed with respect to their forecasted noise impact in the year 2005. The assessment accounts for population distributions around the airport and human subjective response to noise, as well as the distribution of noise levels in the surrounding community (footprints). The impact analysis was performed using the Airport-noise Levels and Annoyance Model (ALAMO), an airport community response model recently developed at Langley Research Center. Author

AEROSOUND FROM CORNER FLOW AND FLAP FLOW

W. C. Meecham Jul. 1982 41 p refs Prepared in cooperation with Mechanics Development Co., Pacific Palisades, Calif.
(Contract NAS2-10590)
(NASA-CR-166396; NAS 1.26:166396) Avail: NTIS HC A03/MF A01 CSCL 20A

Noise generation at the edge of a wing flap is analyzed. The phenomenon as a single vortex moving around a corner in an incompressible, potential flow is modelled. Vortex image retarding effects are proposed as an explanation for small Strouhal numbers. The model surface pressures, sound pressures (using Curle's theory), and Mach number dependencies agree with wind tunnel experiments. A double pressure peak is found in the model (credited to image action) which is qualitatively similar to measured sound correlations. Incompressible flow aerosound calculations are discussed. The effects of a series of vortices moving in the same idealized potential flow are also studied. The vortices are assumed to be statistically independent so their intensities can be added. The frequency of appearance of the vortices are determined from measurements. Diffraction effects caused by the presence of the wing near the dipole sound radiators on the flap surfaces are included. ROUGH ANALYSIS OF INSTALLATION EFFECTS ON TURBOPROP NOISE

Paul A. Durbin and John F. Groeneweg 1982 17 p refs Proposed for Presentation at the Acoust. Soc. of Am., Orlando, Fla., 8-12 Nov. 1982
(NASA-TM-82924; E-1316; NAS 1.15:82924) Avail: NTIS HC A02/MF A01 CSCL 20A

A rough analysis of noise from a propeller operated at angle of attack, and in the nonuniform flow due to a line vortex approximating a wing flow field suggests installation can significantly affect turboprop noise levels. On one side of the propeller, where the blades approach the horizontal plane from above, decreases of noise occur; while on the other side noise increases. The noise reduction is due to negative interference of steady and unsteady sources. An angle of attack, or distance between propeller and vortex, exists for which noise is a minimum. Author

HELICOPTER NOISE DEFINITION REPORT UH-60A, S-76, A-109, 206-L Final Report

J. Steven Newman, Edward J. Rickley (DOT, Cambridge, Mass.), and David W. Ford Dec. 1981 687 p
(AD-A116363; DOT/FAA/EE-81/16) Avail: NTIS HC A99/MF A01 CSCL 20/1

This document presents noise data for the Sikorsky UH-60A Blackhawk, the Sikorsky S-76 Spirit, the Agusta A-109 and the Bell 206-L. The acoustical data are accompanied by phototheodolite tracking data, cockpit instrument panel photo data, and meteorological data acquired from radiosonde balloons. Acoustical metrics include both noise certification metrics (EPNL, PNLT, PNL) as well as community/airport noise assessment metrics (SEL, dBA). Noise data have been acquired systematically to identify variations in level with variations in helicopter airspeed and altitude. Data contained in this report provide essential information for development of helicopter noise exposure contours as well as further evaluation of ICAO helicopter noise certification standards. Accordingly, this information will be of interest to helicopter manufacturers, airport planning consultants, acoustical engineers and airport managers. This report serves as a noise definition document establishing baseline acoustical characteristics of the test helicopters. Author (GRA)

FIBER OPTICS REMOTING OF TERMINAL RADAR AND BEACON SIGNALS Final Report, Jul. 1980 - May 1981

Robert G. Oliver May 1982 68 p refs
(FAA Proj. 021-241-860)
(AD-A116403; FAA-CT-81-71; FAA-RD-82-20) Avail: NTIS HC A04/MF A01 CSCL 17/9

This report discusses the study phase of the terminal radar-beacon fiber optics remoting project. Fiber optics technology is discussed and applied to the remoting of airport sureveillance radar (ASR) and air traffic control beacon interrogator (ATCBI) video and control signals. The requirements of this system are outlined and an engineering model, using multiplexed and nonmultiplexed video transmissions, is specified for installation at the Federal Aviation Administration (FAA) Technical Center. Tests to be conducted on this system are briefly outlined. Cost estimates are presented as well as suggested sources of supply fort the fiber optic components. The interface to the ASR and ATCBI systems is described. It is recommended that the system be built by the technical center. A schedule for completion of the remainder of the project is presented. THERMODYNAMIC AND TRANSPORT COMBUSTION PROPERTIES OF HYDROCARBONS WITH AIR. PART 1: PROPERTIES IN SI UNITS

Sanford Gordon Jul. 1982 397 p refs
(NASA-TP-1906; E-946; NAS 1.60:1906) Avail: NTIS HC A17/MF A01 CSCL 20M

Thermodynamic and transport combustion properties were calculated for a wide range of conditions for the reaction of hydrocarbons with air. Three hydrogen-carbon atom ratios (H/C = 1.7, 2.0, 2.1) were selected to represent the range of aircraft fuels. For each of these H/C ratios, combustion properties were calculated for the following conditions: Equivalence ratio: 0, 0.25, 0.5, 0.75, 1.0, 1.25 Water - dry air mass ratio: 0, 0.03 Pressure, kPa: 1.01325, 10.1325, 101.325, 1013.25, 5066.25 (or in atm: 0.01, 0.1, 1, 10, 50) Temperature, K: every 10 degrees from 200 to 900 K; every 50 degrees from 900 to 3000 K Temperature, R: every 20 degrees from 360 to 1600 R; very 100 degrees from 1600 to 5400 R. The properties presented are composition, density, molecular weight, enthalphy, entropy, specific heat at constant pressure, volume derivatives, isentropic exponent, velocity of sound, viscosity, thermal conductivity, and Prandtl number. Property tables are based on composites that were calculated by assuming both: (1) chemical equilibrium (for both homogeneous and heterogeneous phases) and (2) constant compositions for all temperatures. Properties in SI units are presented in this report for the Kelvin temperature schedules. Author

Development of the advanced composite ground spoiler for C-1 medium transport aircraft A82-39895
Development status of a composite vertical stabilizer for a jet trainer A82-39897
Operation V10F - Development of a composite material wing A82-40934
Development of materials and manufacturing technology over the next 20 years: Composite materials [MBB-UD-341-82-O] N82-28365

PLASTICS
Heat release rate calorimetry of engineering plastics A82-41075

PLOTTERS
Programs for the transonic wind tunnel data processing installation. Part 8: Programs for processing data on the central site computer [AD-A112900] N82-28310

POLYMERIZATION
Water-compatible polymer concrete materials for use in rapid repair systems for airport runways [DE82-010994] N82-29464

POROUS BOUNDARY LAYER CONTROL
Aerodynamic development of laminar flow control on swept wings using distributed suction through porous surfaces A82-40894

POROUS PLATES
Turbulent boundary layer on a porous surface with injection at various angles to the wall A82-39402

POTENTIAL FLOW
Evaluation of an asymptotic method for helicopter rotor airloads A82-40509
Transonic small disturbance code for body-wing configuration coupled with full potential code for wing alone A82-40899
The prediction of propeller/wing interaction effects A82-40948

POWDER METALLURGY
International aviation (selected articles) [AD-A114422] N82-28245

POWERED LIFT AIRCRAFT
Development of the Circulation Control Wing-Upper Surface Blowing powered-lift system for STOL aircraft A82-40969
Ejector powered propulsion and high lift subsonic wing A82-40970
QCSEE over-the-wing engine acoustic data [NASA-TM-82708] N82-29324

PREDICTION ANALYSIS TECHNIQUES
Prediction of fatigue crack growth rates under variable loading using a simple crack closure model [NLR-MP-81023-U] N82-28685
Effect of water on axial flow compressors. Part 2: Computational program [AD-A114831] N82-29327

PREDICTIONS
Future trends and problems N82-29318

PRESSURE DISTRIBUTION
Experimental and theoretical studies of three-dimensional turbulent boundary layers on an empennage of a typical transport airplane A82-40985

PRESSURE GRADIENTS
Comparison of experimental and analytic performance for contoured endwall stators
[AIAA PAPER 82-1286] A82-40422
PRESSURE MEASUREMENT
Analysis and wind tunnel tests of a probe used to sense altitude through measurement of static pressure
[AIAA PAPER 82-1361] A82-39128
An experimental investigation of leading-edge spanwise blowing
A82-40989
PRESSURE SENSORS
Analysis and wind tunnel tests of a probe used to sense altitude through measurement of static pressure
[AIAA PAPER 82-1361] A82-39128
PREVENTION
Human response to fire
N82-29281
PROBABILITY THEORY
The Shiryayev sequential probability ratio test for redundancy management
[AIAA 82-1623] A82-38998
PRODUCTION COSTS
Unmanned aircraft in future combat
A82-39728
PROJECT MANAGEMENT
Engineering aspects of international collaboration on Tornado
A82-40878
PROPELLER BLADES
The application of small propellers to RPV propulsion
A82-39737
PROPELLER FANS
Turboprop design - Now and the future
A82-40965
PROPELLER SLIPSTREAMS
The prediction of propeller/wing interaction effects
A82-40948
Use of the cavitation tunnel at the Dutch Naval Experiment station (NSP), Wageningen for the determination of the acoustic source strength of propeller cavitation
[TPD-908-720] N82-29116
PROPELLERS
Propulsion opportunities for future commuter aircraft
[AIAA PAPER 82-1049] A82-40418
Summary and recent results from the NASA advanced high-speed propeller research program
[AIAA PAPER 82-1119] A82-40419
Use of the cavitation tunnel at the Dutch Naval Experiment station (NSP), Wageningen for the determination of the acoustic source strength of propeller cavitation
[TPD-908-720] N82-29116
Heads up display
[NASA-CASE-LAR-12630-1] N82-29319
PROPULSION SYSTEM CONFIGURATIONS
Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference --- wind tunnel tests
[NLR-MP-81020-U] N82-28262
PROPULSION SYSTEM PERFORMANCE
Supersonic missile aerodynamic and performance relationships for low observables mission profiles
[AIAA PAPER 82-1298] A82-39085
Mini-RPV propulsion
A82-39736
The application of small propellers to RPV propulsion
A82-39737
Electric propulsion for a mini RPV system
A82-39744
Propulsion opportunities for future commuter aircraft
[AIAA PAPER 82-1049] A82-40418
Summary and recent results from the NASA advanced high-speed propeller research program
[AIAA PAPER 82-1119] A82-40419
Civil helicopter propulsion system reliability and engine monitoring technology assessments
A82-40518
Aerodynamic concepts for fuel-efficient transport aircraft
A82-40957
An improved propulsion system simulation technique for scaled wind tunnel model testing of advanced fighters
A82-41019
PROPULSIVE EFFICIENCY
The application of small propellers to RPV propulsion
A82-39737
Aircraft design for fuel efficiency
A82-40973
PROTECTION
Carbon fiber reinforced composite structures protected with metal surfaces against lightning strike damage
[MBB-UD-340-82-O/E] N82-28364
PROTECTIVE CLOTHING
Human response to fire
N82-29281
PROTOTYPES
Evaluation of CFRP prototype structures for aircraft
A82-39892
Fabrication of CFRP prototype structure for aircraft horizontal tail leading edge slat rail
A82-39896
PULSE COMMUNICATION
Digital computer simulation of modern aeronautical digital communication systems
A82-40940
PULTRUSION
Adaptation of pultrusion to the manufacture of helicopter components
A82-40537
PUSHBROOM SENSOR MODES
Opto-electronical push-broom scanners for navigation, reconnaissance and generation of digital data bases
A82-39747

Q

QUADRATIC PROGRAMMING
Efficient optimum design of structures - Program DDDU
A82-38146
QUALITY CONTROL
Recommended practice for a demonstration of Nondestructive Evaluation /NDE/ reliability on aircraft production parts - Introduction to the guidelines
A82-41140

R

RADAR DETECTION
Complete flexibility and realism in radar simulation
A82-38461
Demonstration of radar reflector detection and ground clutter suppression using airborne weather and mapping radar
A82-40532
RADAR EQUIPMENT
Radars for UMA
A82-39742
RADAR MAPS
Demonstration of radar reflector detection and ground clutter suppression using airborne weather and mapping radar
A82-40532
RADAR MEASUREMENT
Baseline monitoring using aircraft laser ranging --- spaceborne laser simulation and aircraft laser tracking
[NASA-TM-73298] N82-28690
RADAR REFLECTORS
Demonstration of radar reflector detection and ground clutter suppression using airborne weather and mapping radar
A82-40532
RADAR RESOLUTION
Flight test evaluation of a video tracker for enhanced offshore airborne radar approach capability
A82-40531
RADAR TARGETS
Moving target detector (Mod 2)
[AD-A114709] N82-29520

WAVE FRONTS
Design study for a low-distortion holographic HUD
[AD-A113982] N82-28292
WAVE PROPAGATION
The effect of barriers on wave propagation phenomena: With application for aircraft noise shielding
[NASA-CR-169128] N82-29111
WEAPON SYSTEMS
Target tracking using area correlation
A82-39194
Logistics research program in the United States Air Force
A82-40963
Kinematic investigation Hughes Helicopter 7.62mm chain gun
[AD-A113114] N82-28287
WEAPONS DELIVERY
Target acquisition system/air-to-surface weapon compatibility analysis
[AIAA 82-1618] A82-38995
Unmanned aircraft in future combat
A82-39728
WEATHER
The operation of aircraft and helicopters in difficult meteorological and environmental conditions --- Russian book
A82-39295
WEDGE FLOW
Improved solutions to the Falkner-Skan boundary-layer equation
A82-38263
WEIGHT REDUCTION
Committing composites to the Boeing 767
A82-38224
The national dynamics 'observer' mini-RPV for tropical operation
A82-39734
Mini-RPV propulsion
A82-39736
Radars for UMA
A82-39742
Electric propulsion for a mini RPV system
A82-39744
A summary of weight savings data for composite VSTOL structure
A82-40546
WELD TESTS
In-motion radiography of titanium spar tube welds
A82-40538
WELDED JOINTS
Fatigue behavior of weldbonded joints
A82-41115
WHEEL BRAKES
Touchdown technology --- large aircraft landing gear stress
A82-40057
WIND MEASUREMENT
The detection of low level wind shear. II
A82-38463
WIND SHEAR
The detection of low level wind shear. II
A82-38463
Wind shear - Its effect on an aircraft and ways to reduce the hazard. II
A82-38500
Optimal open-loop aircraft control for go-around maneuvers under wind shear influence
A82-40943
A study of wind shear effects on aircraft operations and safety in Australia
[ARL-SYS-REPT-24] N82-28265
WIND TUNNEL CALIBRATION
Correlation of Preston-tube data with laminar skin friction (Log No. J12984)
[NASA-TM-84827] N82-29556
WIND TUNNEL MODELS
Robust Kalman filter design for active flutter suppression systems
A82-38442
Correlation of predicted vibrations and test data for a wind tunnel helicopter model
A82-40515
Wind tunnel modeling of rotor vibratory loads
A82-40516
Wind-tunnel investigation of vortex flaps on a highly swept interceptor configuration
A82-41004
Research model wing/tail fabrication --- transonic wind tunnel 1/7.5-scale model
[AD-A114101] N82-28288
Investigation of correlation between full-scale and fifth-scale wind tunnel tests of a Bell helicopter Textron Model 222
[NASA-CR-166362] N82-29315
WIND TUNNEL STABILITY TESTS
Wind tunnel measurements of longitudinal stability and control characteristics of primary and secondary wing configurations
A82-41025
WIND TUNNEL TESTS
Measurement and visualization of skin friction on the leeside of delta wings in supersonic flow
A82-38785
An X-Wing aircraft control system concept
[AIAA 82-1540] A82-38954
An estimation of aerodynamic forces and moments on an airplane model under steady state spin conditions
[AIAA PAPER 82-1311] A82-39092
Analysis and wind tunnel tests of a probe used to sense altitude through measurement of static pressure
[AIAA PAPER 82-1361] A82-39128
Analytic extrapolation to full scale aircraft dynamics
[AIAA PAPER 82-1387] A82-39143
Summary of sting interference effects for cone, missile, and aircraft configurations as determined by dynamic and static measurements
[AIAA PAPER 82-1366] A82-40395
An experimental and numerical study of 3-D rotor wakes in hovering flight
A82-40946
Aerodynamic interactions between a 1/6-scale helicopter rotor and a body of revolution
A82-40947
The prediction of propeller/wing interaction effects
A82-40948
Wind-tunnel testing of V/STOL configurations at high lift
A82-40949
Design and tests of airfoils for sailplanes with an application to the ASW-19B
A82-40967
Spin behaviour of the Pilatus PC-7 Turbor Trainer
A82-40979
Vortex formation over double-delta wings
A82-40989
Wind tunnel test and aerodynamic analysis of three aeroelastically tailored wings
A82-41001
Fuselage effects in leading edge vortex flap aerodynamics
A82-41006
An improved propulsion system simulation technique for scaled wind tunnel model testing of advanced fighters
A82-41019
Wind-tunnel investigation of a full-scale canard-configured general aviation aircraft
A82-41024
Aerodynamic interactions between a 1/6 scale helicopter rotor and a body of revolution
[NASA-TM-84247] N82-28252
Wind-tunnel evaluation of an aeroelastically conformable rotor
[AD-A114384] N82-28260
Investigation of correlation between full-scale and fifth-scale wind tunnel tests of a Bell helicopter Textron Model 222
[NASA-CR-166362] N82-29315
Windtunnel capability related to test sections, cryogenics, and computer-windtunnel integration
[AGARD-AR-174] N82-29334
Forward velocity effects on fan noise and the suppression characteristics of advanced inlets as measured in the NASA-Ames 40 by 80 foot wind tunnel
[NASA-CR-152328] N82-30030
WIND TUNNEL WALLS
Aerodynamic behavior of a slender slot in a wind tunnel wall
A82-38281
Wind-tunnel testing of V/STOL configurations at high lift
A82-40949

Measuring the flow properties of slotted test-section walls [FFA-135] N82-28571

WIND VELOCITY
Computer enhanced analysis of a jet in a cross-stream N82-29555

WINDSHIELDS
Analysis of an airplane windshield anti-icing system [AIAA PAPER 82-1372] A82-39134

WING FLOW METHOD TESTS
The unsteady motion of a wing traveling at subsonic speed above a plane A82-39358
Vortex formation over double-delta wings A82-40989

WING LOADING
Investigation of the unsteady airloads on a transport aircraft type airfoil with two interchangeable oscillating trailing edge flaps, at transonic speed and high Reynolds numbers A82-40909
The design integration of wingtip devices for light general aviation aircraft A82-40933
Operation V10F - Development of a composite material wing A82-40934
A crack growth model under spectrum loading A82-40961
Test results of chordwise and spanwise blowing for low-speed lift augmentation A82-40999
Minimum induced drag of canard configurations A82-41116
Automated optimum design of wing structures. Deterministic and probabilistic approaches [NASA-TM-84475] N82-29317

WING NACELLE CONFIGURATIONS
The use of small strakes to reduce interference drag of a low wing, twin engine airplane [AIAA PAPER 82-1323] A82-39100
The prediction of propeller/wing interaction effects A82-40948

WING OSCILLATIONS
Dynamic load measurements with delta wings undergoing self-induced roll-oscillations [AIAA PAPER 82-1320] A82-39098
Theoretical and experimental investigation of joint-structural damping interaction for airplane construction A82-41013

WING PANELS
Efficient optimum design of structures - Program DDDU A82-38146
Operation V10F - Development of a composite material wing A82-40934

WING PLANFORMS
Wind tunnel test and aerodynamic analysis of three aeroelastically tailored wings A82-41001

WING PROFILES
Numerical methods for solving boundary value problems for noncavitating and cavitating flow past wing profiles A82-38722
Numerical solution of a problem concerning transonic flow past a wing-fuselage configuration A82-39996
Computation of supersonic flow around three-dimensional wings A82-40898
Dual wing, swept forward swept rearward wing, and single wing design optimisation for high performance business airplanes A82-40931
Ejector powered propulsion and high lift subsonic wing A82-40970
Wing design for supersonic cruise/transonic maneuver aircraft A82-41021
Automated optimum design of wing structures. Deterministic and probabilistic approaches [NASA-TM-84475] N82-29317

WING SPAN
The rectangular wing with semiinfinite span in nonlinear theory A82-39359

WING TIP VORTICES
Close-coupled canard-wing vortex interaction and Reynolds stress acquisition [AIAA PAPER 82-1368] A82-39132

WING TIPS
Gust load alleviation on Airbus A 300 A82-40881
Wing-tip jets aerodynamic performance A82-40987
Analysis of vibration induced error in turbulence velocity measurements from an aircraft wing tip boom [NASA-CR-3571] N82-28881

WING-FUSELAGE STORES
Wind tunnel studies of store separation with load factor. Freedrops and captive trajectories N82-30261

WINGLETS
The design integration of wingtip devices for light general aviation aircraft A82-40933

WINGS
Investigations regarding vortex formation at wings with bent leading edges A82-38783
Optimization of flight with tilt wings A82-40912
Advanced aerodynamic wing design for commercial transports - Review of a technology program in the Netherlands A82-40985
Means for controlling aerodynamically induced twist [NASA-CASE-LAR-12175-1] N82-28279

wakes and the blades are modeled in terms of a lifting line 1/4 from the front of the blade. Modifications of the linear theory of aeroelastic coupling is guided by two-dimensional results on stalled profiles. The complete nonlinear system is transformed by means of the introduction of quasi-steady constraints in order to estimate power increases necessary to overcome losses due to flow separation. M.S.K.

A82-42810 # Corrections for wall effects in ONERA industrial wind tunnels (Améliorations des calculs des effets de parois dans les souffleries industrielles de l'ONERA). X. Vaucheret (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(NATO, AGARD, Meeting on Prediction of Aerodynamic Loads on Rotorcraft, London, England, May 17-19, 1982.) ONERA, TP* no. 1982-34, 1982. 13 p. 11 refs. In French.

Analytical methods for allowing for the effects of the walls on flows in transonic wind tunnels operated by ONERA are presented. The discussion is limited to the case of three-dimensional models in cylindrical wind channels. Attention is given to the numerical description of the model and the sting mount, to the use of a method of characteristics for the verification of the numerical models of the model-sting configurations and the models of wall porosity, and to correction coefficients for particular wind tunnel channels. A volumetric representation of ellipsoidal fuselages is discussed, including using a number of doublets equal to twice the thickness of the fuselage. Further consideration is given to the calculation of lift, wall porosity, nonzero lift characteristics, and corrections of the Mach number. M.S.K.

A82-42811 # An examination of helicopter blade profiles and tips (Etudes de profils et d'extrémités de pale d'hélicoptère). J. J. Thibert and J. J. Philippe (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(NATO, AGARD, Meeting on Prediction of Aerodynamic Loads on Rotorcraft, London, England, May 17-19, 1982.) ONERA, TP* no. 1982-35, 1982. 15 p. 28 refs. In French.

The results of long-term ONERA research into profiles and tips of composite material helicopter blades are summarized. Consideration is given to the use of symmetric NACA profiles on older helicopter designs and to the development of new profiles with numerically modeled internal and external sections. Trials with the OA2XX profile blades on scale model helicopters in the Modane wind tunnel have shown a nominal power augmentation of 9 percent. Flight tests with OA209 blades have, in comparison with the NACA 0012 blades, displayed isopower increases of 2 percent, an enlarged flight envelope such as 10 percent maximum speed or power increases, and more economic rotor performance at high speeds. Two dimensional modeling of the interior of the rotor has been shown to give way to three-dimensional modeling near the tip in order to maintain accuracy. Iso-Mach lines have been calculated from azimuths of 60 and 120 deg and with bending of 30 deg. Further studies to evaluate parabolically flexed tip configurations are indicated. M.S.K.

A82-42813 # The use of adaptive walls in plane flows (Utilisation de parois adaptables pour les essais en courant plan). J. P. Archambaud (ONERA, Centre d'Etudes et de Recherches de Toulouse, Toulouse, France) and J. P. Chevallier (ONERA, Division d'Aérodynamique Expérimentale, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(NATO, AGARD, Meeting on Wall Interference in Wind Tunnels, London, England, May 19, 20, 1982.) ONERA, TP* no. 1982-38, 1982. 15 p. 38 refs. In French.

Computational methods which take into account the effects induced in plane flows by the presence of adaptive walls in a wind tunnel are presented, along with test results from the ONERA T2 transonic wind tunnel. Modeling of the wall effects through the method of signatures is analytically described, with consideration given to the length of the adapted regions, fairings with up- and down-stream regions, residual effects, and reference conditions. Operation of the walls to induce varying flow conditions is outlined, and iterative procedures for quantifying the flow under the initial, changing, and new conditions are presented. The numerical techniques are shown to include factors such as the diminution of the flow in proportion to the distance from the adaptive wall sections, movement of the walls in 2 mm steps to examine camber, and fast convergence of the solution of adaptation to acceleration represented by a single gust. M.S.K.

A82-42817 # Boundary layer transducers /DCL/ developed for the study of the flow over helicopter rotor blades. C. Armand, P. Combet, and J.-P. Drevet (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Institute of Electrical and Electronics Engineers, Congress on Instrumentation in Aerospace Simulation Facilities, 9th, University of Dayton, Dayton, OH, Sept. 20-Oct. 2, 1981.) ONERA, TP* no. 1981-93, 1981. 9 p. 5 refs.

The development of thermistors as a suitable replacement for hot-film transducers for boundary layer experiments in the ONERA Modane test center is described, and comparisons are made between performances of the thermistor and hot-film devices. The operation of both apparatus is described in terms of the power fluctuations necessary to maintain a constant temperature in an electrically heated element subject to ambient fluctuating flow. Operating parameters for boundary layer transducers are defined. Fabrication of a 0.2 sq mm, 10 microns thick, 200 ohms resistance (low temperature) and 250 ohms (high temperature), 11 mA heating element semiconductor thermistor for boundary layer studies is noted, including characteristics which form a Wheatstone bridge. The measurement voltage has been transmitted over 100 m without loss, and frequencies of pressure fluctuations have been detected up to 15 kHz. Wind tunnel tests with both types of transducers implanted on rotary wings have revealed conditions which are not quantifiable using models for fixed wing flowfields. M.S.K.

A82-42849 Taking the drag out of bombs. C. Epstein (NATO, Brussels, Belgium). *Flight International,* vol. 122, Aug. 21, 1982, p. 418-420.

Conformal carriage of weapons and stores offers significant advantages over external multiple ejector rack carriage, expanding the flight envelope of the F-4 (with twelve 500 pound bombs) from Mach 1.1 to 1.8, reducing overall drag 60% and extending mission radius nearly 50%. Conformal mounting of fuel tanks (fast packs) on the F-15C provides more than 230 n mi further low altitude dash, 100 n mi further radius at Mach 2, and from one and one-half to three hours extra on-station time at a 500 n mi radius. Radar cross-section and maneuverability are also improved. The General Dynamics F-16XL features semi-conformal weapons carriage, and comparable improvements of performance are expected. A.B.

A82-42865 # In-flight acoustic emission monitoring. I. G. Scott (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia). In: Symposium on Nondestructive Evaluation, 13th, San Antonio, TX, April 21-23, 1981, Proceedings. San Antonio, TX, Southwest Research Institute, 1982, p. 210-219. 8 refs.

The feasibility of the in-flight acoustic emission (AE) monitoring of fatigue cracks has been assessed by a flight test program employing a Royal Australian Air Force Macchi jet trainer aircraft. It is found that despite the hostile environment in which the equipment is operating, AE signals originating from a known spar fatigue crack have upon analysis yielded suggestive data on the relation between AE, flight regimes and crack growth parameters. Magnetic rubber replica inspection, EPROM flight data recording and flight profile data breakdowns have been employed in this research project. O.C.

A82-42887 # Laser pointing in a turbulent atmosphere. A. L. Pavel (USAF, Weapons Laboratory, Kirtland AFB, NM). In: Aero-optical phenomena. New York, American Institute of Aeronautics and Astronautics, 1982, p. 401-411. 10 refs.

The sources of jitter encountered in optical pointing from an airborne platform are surveyed. Aircraft always operate in some level of atmospheric turbulence and this turbulence induces motion which must be compensated for by an optical pointing system. Levels of atmospheric gust turbulence are related to the corresponding airframe jitter. This level of jitter will determine the capability required by the pointing system. Once the beam leaves the aircraft the final pointing accuracy becomes a function of atmospheric turbulence, which influences the index of refraction of the air through which the light must pass. Levels of atmospheric temperature turbulence are used to predict system jitter that could be expected. The combined effects of atmospheric gust and temperature turbulence constitute the budget of beam jitter that must be factored into laser pointing experiments. (Author)

A82-42893 † Antiwear properties of additives based on higher fatty acids (Protivoiznosnye svoistva prisadok na osnove vysshikh zhirnykh kislot). O. P. Lykov, T. P. Vishniakova, V. V. Sashevskii, and L. S. Zaitseva (Moskovskii Institut Neftekhimicheskoi i Gazovoi Promyshlennosti, Moscow, USSR). *Khimiia i Tekhnologiia Topliv i Masel,* no. 8, 1982, p. 16, 17. 5 refs. In Russian.

The antiwear characteristics of additives based on higher fatty acids isolated from C17-C20 fractions and residues of synthetic fatty acids production have been investigated experimentally using the additives with hydrofined jet fuel T-7. Of the additives investigated, isomonocarboxylic and unsaturated acids of C17-C20 fractions are found to have the highest antiwear characteristics when used in amounts of 0.002-0.007 mass %. V.L.

A82-42894 † Determination of antioxidant content in aviation oils using thin-layer chromatography (Opredelenie soderzhaniia antiokislitel'nykh prisadok v aviatsionnykh maslakh metodom TSKh). P. A. Mikheichev, A. V. Vilenkin, and I. M. Novikova (GOSNIIErat GA, USSR). *Khimiia i Tekhnologiia Topliv i Masel,* no. 8, 1982, p. 35-37. 6 refs. In Russian.

A method based on thin-layer gas chromatography is proposed for determining the amounts of antioxidants in fresh and used aviation oils. The accuracy of the method has been verified by determining the content (which was known to be 0.35% by mass) of dibutyl-n-cresol additive in oil. Analysis of the measurements has shown that the method is accurate to within 6.0%, which is sufficient for oil quality control purposes. V.L.

A82-42895 † Antioxidants for synthetic oils (Antiokislitel'nye prisadki k sinteticheskim maslam). Kh. N. Kulieva and V. S. Smolenkova (Akademiia Nauk Azerbaidzhanskoi SSR, Baku, Azerbaidzhan SSR). *Khimiia i Tekhnologiia Topliv i Masel,* no. 8, 1982, p. 40-42. 21 refs. In Russian.

Recent advances in the synthesis of antioxidants for synthetic lubrication oils used in modern jet engines are briefly reviewed. In particular, consideration is given to nitrogen-containing antioxidants (e.g., succinimide-type compounds, aromatic amines, and Schiff's bases), metal-containing antioxidants (e.g., complex compounds of group I or group VIII metals), and mixtures of two or three different antioxidants characterized by a synergic effect. V.L.

A82-42950 * # **Transient phenomena of shock-induced turbulent separation for a spikebody and stalling airfoil at transonic and supersonic speeds.** K. K. Yoshikawa (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, 9th, San Diego, CA, Aug. 9-11, 1982, Paper 82-1362.* 19 p. 17 refs.

The time-dependent, compressible, Reynolds-averaged, full Navier-Stokes equations are applied to solve an axisymmetric flow around a forward-facing stepbody (spikebody) at supersonic speeds and a stalling airfoil at transonic speeds. Important transient and unsteady phenomena, not yet well understood, are examined, and significant new findings of the present solution to the phenomena are discussed. The phenomena described in detail are as follows: The evolution of the shock wave pressure built up by the impact of the pressure waves, one from the trailing edge; the separation of the flow as influenced by the shock wave; the location of the reversed flow, the separation point, and the reattachment point; and the transient (or unsteady) phenomena of the flow pulsation, oscillation, and stalling of the body and airfoil wake flow. The numerical results show that the transient flow instability is caused by a supersonic jet induced in the separation bubble by the shock-bifurcation (lambda shock) mechanism between the separation shock and the reflected shock. Pulsation and stall phenomena are caused by a sudden increase in the leading-edge pressure due to the jet and the separation bubble interacting along the stagnation point flow. (Author)

A82-43091 **Apache to provide night/bad weather capability.** R. R. Ropelewski. *Aviation Week and Space Technology*, vol. 117, Sept. 13, 1982, p. 42, 43, 45 (4 ff.).

Test flights of the Hughes AH-64 Apache advanced attack helicopter, due for delivery to the Army in early 1984, displayed its capability for night and adverse weather antitank/operations. The aircraft's two 1,690 shp T700-GE-701 engines exceeded the Army's high/hot rate of climb requirements and provided a maximum 1,700-1,800 fpm rate of climb. Low altitude nap-of-the-earth flying is facilitated by the precision and quick response of the handling, as well as by the high instantaneous turn rate. Doppler navigation system, day/night vision systems, laser ranging/ designating/tracking and digital fire control computer are integrated to minimize the need for communications between the two cockpits, and to reduce the pilot workload. The AH-64 is armed with Hellfire missiles, and standard 2.75-inch rockets. A.B.

A82-43092 **New nozzle design aimed at F-15, F-16 aircraft.** *Aviation Week and Space Technology*, vol. 117, Sept. 13, 1982, p. 67, 71, 73.

The two-dimensional convergent/divergent nozzle consists of two convergent-/divergent flaps which vary thrust and exit area as well as control vectoring and reversing. Vectoring on the order of + or - 30 degrees is possible. Designed for short takeoff and landing, and for high Mach maneuvering, landing distances on dry runways are reduced from 3,000 to 1,000 feet, and from 10,000 to 1,200 feet on icy runways. The rectangular nozzle has lower cost and weight than circular nozzles with the same capacity. Ground demonstration tests produced a maximum 8,000 pound perpendicular thrust component and 6,200 pounds of reverse thrust. The nozzle could be employed in an F-15 or F-16, and several external contours for it are being considered. A.B.

A82-43111 # **Construction and testing of an Omega navigation system for the balloon-borne X-ray experiment (Aufbau und Test eines Omega-Navigationssystems für das Ballon-Röntgenexperiment).** E. Götz. Tübingen, Universität, Astronomisches Institut, Diplomarbeit, 1981. 109 p. 26 refs. In German.

Various systems are compared for their suitability for determining balloon position. The Omega navigation system is discussed, with emphasis on the propagation characteristics of VLF waves, which strongly influence the positional accuracy of the system. A concept for a Tübingen navigation system is presented that is suitable for position determination in the X-ray experiment. A software algorithm that permits the application of hyperbolic coordinates to geographic position is described along with a real-time program that would evaluate the data from the Omega receiver during balloon flight and convert them to geographical position using the algorithm. This calculation procedure is confirmed by a test and its attainable accuracy is found. The receiver electronics and its functional principle is discussed, as is the mode of data transfer to the computer. C.D.

A82-43184 **The external balance system of the German- Dutch windtunnel DNW and its strain gage load cells.** C. C. Groothoff (Nationaal Lucht- en Ruimtevaartlaboratorium, Emmeloord, Netherlands), D. Theiss, and P. Giesecke (Carl Schenck AG, Darmstadt, West Germany). In: Symposium on Force, Pressure, Displacement and Flow Sensors, Technische Hogeschool Twente, Enschede, Netherlands, May 13, 14, 1982, Proceedings. (A82-43176 21-35) Enschede, Netherlands, Technische Hogeschool Twente, 1981, p. 99-113.

The external six component balance system of the German-Dutch Windtunnel DNW is described. Although designed for a multitude of testing circumstances, the requirements on aircraft model testing were dominant. The applied aerodynamic loads (e.g. 65,000 N lift) and the dimensions of the models and wind tunnel size resulted in a large and heavy instrument. The balance is of the platform type, enabling a simple and stiff construction. The requirements regarding the allowable errors - order of magnitude 0.1% f.s for forces, 0.2% f.s for moments - posed high demands on the design of the balance and calibration equipment, but check loads showed that the requirements were met. (Author)

A82-43249 **Meteorological aspects of North Atlantic flight tracks - The development of programs for minimum-time tracks.** L. Bennett (Civil Aviation Authority, London, England). *Journal of Navigation*, vol. 35, Sept. 1982, p. 499-501.

The phase of a flight planning operation in which airline personnel calculate minimum time tracks for the purpose of advising oceanic control centers of their needs is described, before defining the Organised Track System. Results are based on 12- and 24-hour forecasts for a 250-mb level, and aircraft with a nominal constant speed of Mach 0.82. The graphical method customarily employed is that of finding the minimum time track, which involves drawing the envelopes of a large number of circles. This, however, is unsuitable for computer implementation. The problem may alternatively be defined in terms of a network, using an algorithm to obtain the shortest paths. O.C.

A82-43250 **Meteorological aspects of North Atlantic flight tracks - Some interim results of the study.** R. Monk (Civil Aviation Authority, London, England). *Journal of Navigation*, vol. 35, Sept. 1982, p. 502-513; Discussion p. 513-516.

A comparison is presented of minimum time North Atlantic flight tracks calculated for the weather conditions forecast and those analyzed after each of the flights between 12 city pairs. The differences show that the effect of forecast error is small, averaging 1.5 min of flying time for both 12- and 24-hour forecasts, and being 4 min or less in about 90% of the flights studied. The remaining 10% range from 4 min to a maximum of 21 min for a 24-hour forecast and 16 min for a 12-hour one. O.C.

A82-43261 * # **Statistical analysis of piloted simulation of real time trajectory optimization algorithms.** D. B. Price (NASA, Langley Research Center, Hampton, VA). *IEEE, AIAA, AIChE, ASME, ISA, and SME, American Control Conference, Arlington, VA, June 13-16, 1982, Paper.* 3 p.

A simulation of time-optimal intercept algorithms for on-board computation of control commands is described. The effects of three different display modes and two different computation modes on the pilots' ability to intercept a moving target in minimum time were tested. Both computation modes employed singular perturbation theory to help simplify the two-point boundary value problem associated with trajectory optimization. Target intercept time was affected by both the display and computation modes chosen, but the display mode chosen was the only significant influence on the miss distance. A.B.

A82-43264 * # **Current perspectives on emergency spin-recovery systems.** R. D. Whipple (NASA, Langley Research Center, Hampton, VA). *Society of Flight Test Engineers, Symposium on Flight Testing Technology - A State of the Art Review, New York, NY, Sept. 19-22, 1982, Paper.* 13 p. 23 refs.

The requirements generated by the loss-of-control problems of contemporary and future aircraft are discussed in connection with the development of rocket and parachute technology for spin-recovery systems used in current aircraft. Recovery rockets must be designed to provide the thrust (not impulse) levels required by the specific application, because insufficient thrust will not effect a recovery regardless of its duration. The need for long firing times and a restart capability make liquid rocket systems preferable. Alternatives to the current tail-mounted method of implementing parachute systems include: nose chutes, wing-tip parachutes, dual-bridle and rigid towline systems. Comparative test results for these and the conventional system are given along with the latest dynamic model test technique for spin-recovery rockets. A.B.

A82-43275 **757 systems key to route flexibility.** R. R. Ropelewski. *Aviation Week and Space Technology*, vol. 117, Aug. 30, 1982, p. 36-38, 43, 45, 46.

The Boeing 757 is a single-aisle narrow body commercial transport accommodating 186 passengers, with twin engines which each produce 37,000 pounds thrust, a maximum takeoff weight of 220,000 pounds, and a maximum range of 2,650 nautical miles. The operating procedures and cockpit layout of the 757 are almost identical to those of the 767, which will permit flight crews to obtain a common rating for both, and can reduce maintenance and support costs for airlines operating both aircraft. The avionics aboard include an integrated flight management computer, autopilot/flight director, thrust management system and color cathode ray tube displays. The maiden flight was on February 19, 1982, and to combined loads, impact, postbuckling effects and local discontinuities are developed. S.L.

PHOTOINTERPRETATION KEY FOR PINE REGENERATION ANALYSIS USING HIGH-ALTITUDE COLOR INFRARED PANORAMIC PHOTOGRAPHY Final Report

B. B. Eav, C. A. Clark, R. E. Kinkle, and J. C. Prill Aug. 1981 38 p refs
(Contract USDA/FS-53-3187-0-29)
(PB82-164450; LEMSCO-16379; NFAP-247) Avail: NTIS HC A03/MF A01 CSCL 02F

A photointerpretation key for analysis of pine regeneration was developed during the second of the three phases of a timber inventory project. The procedures used in developing the photointerpretation key are presented, and the resulting selective photointerpretation key with color illustrations (stereopairs) is presented. This photointerpretation key represents a model application of high-altitude color infrared panoramic photography to timber inventory and should pave the way for more imaginative applications of optical bar technoloy to resource inventories. AIRBORNE MEASUREMENTS OF EUROPEAN SKY AND TERRAIN RADIANCES Scientific Interim Report

Richard W. Johnson Aug. 1981 36 p refs
(Contract F19628-78-C-0200; AF Proj. 6210)
(AD-A114637; SIO-82-2; AFGL-TR-81-0275; SIR-19) Avail: NTIS HC A03/MF A01 CSCL 04/1

A data set which contains nearly 500 arrays representing measurements of sky and terrain radiance values from 47 different flights is described and illustrated. The measurements were made using radiometer systems mounted on a C-130 aircraft during a series of European flights associated with the NATO program OPAQUE. Radiance measurements throughout the 4 pi field surrounding the aircraft were made in four spectral bands having mean wavelengths of 478, 557, 664, and 765 nm. Spectral sets of measurements were made at each of several altitudes between the surface and approximately 6 km AGL. Evaluation of the data illustrates good orientation and radiometric accuracies, except for stray light influences as the radiometer field of view swept near and through the solar disc. Corrective procedures are outlined and their application is undergoing further refinement. These data are appropriate for use in the development of operationally useful predictive models. The radiance data in conjunction with their companion scattering coefficient data, are readily applicable to the determination of slant path contrast transmittances, atmospheric optical depths, aerosol directional scattering characteristics, flux divergences and their attendant determinations of turbid atmospheric single scattering albedos. EVALUATION OF THE FAA/MITRE WEATHER DATA DEVICE Final Report

Delmar G. Pullins Washington FAA Jan. 1982 59 p refs
(Contract DTFA01-81-C-10007)
(AD-A114646; OU/AEC/EER-54-1; DOT-FAA-RD-82-14) Avail: NTIS HC A04/MF A01 CSCL 04/2

A cockpit weather display unit was evaluated. Twenty subject pilots were flown using prerecorded weather information, and real time weather information from the Columbus weather radar. The airborne system consists of a VOR Receiver, a processor unit, a control module, and a hardcopy printer that provides the pilot with ground weather radar information in the cockpit upon demand. It is found that providing the pilot with a low cost, real time radar weather information source, will be a distinct factor in reducing unnecessary radio transmissions, controller workload, and will aid the pilot in decision making. The installation of such a unit in the cockpit would eliminate errors due to verbal communication of the weather picture, provide useful information, and directly attack the major problem of aviation thunderstorm avoidance. E.A.K.

FIELD PROGRAM OPERATIONS: TURBULENCE AND GUST FRONT Final Report, Mar. 1980 - Dec. 1980

J. T. Lee and R. J. Doviak Washington FAA Nov. 1981 43 p
(Contract DTFA01-80-Y-10524)
(AD-A115447; DOT-FAA-RD-81-108) Avail: NTIS HC A03/MF A01 CSCL 04/2

Aircraft, rawinsonde network, mesoscale surface network, low-level wind shear alert system at Will Rogers World Airport, 444 m instrumented tower and satellite observations augmented a conventional weather radar and a new, dual Doppler weather radar system to obtain concurrent data on weather hazards to aircraft. Storm days and data acquired are detailed. An objective was to determine the characteristics and detectability of turbulence, wind shear and other aircraft operational weather hazards using indirect (radar) probes. The South Dakota School of Mines T-28 aircraft and the National Aeronautics and Space Administration's F-106 aircraft made thunderstorm penetrations during Doppler radar and lightning operations. Data obtained are discussed, and the analysis of a turbulence case and two gust front cases is presented. Author

A SURVEY OF MELTING LAYER RESEARCH

Robert C. Schaller, Ian D. Cohen, Arnold A. Barnes, Jr., and Lawrence C. Gibbons 4 Jan. 1982 105 p refs
(AF Proj. 2310)
(AD-A115224; AFGL-TR-82-0007; AFGL-AFSG-438) Avail: NTIS HC A06/MF A01 CSCL 01/3

This report summarizes previous melting-layer research both within and outside AFGL and provides recommendations for future research in the melting layer. An extensive literature search provided a bibliography of previous research. This bibliography is included as an appendix. Several definitions of the top and bottom of the melting layer are presented and discussed. Aggregation and breakup appear to be the chief microphysical processes that determine the particle-size spectrum of snow and ice that enter the melting layer. Studies of the actual melting process and of the melting layer as seen by radar are presented. Microphysical and thermodynamic characteristics are discussed. Dynamic considerations are mentioned. Previously gathered aircraft data are reviewed, and recommendations are made for future aircraft and radar data-gathering efforts. Author (GRA)

EVALUATION OF A METEOROLOGICAL AIRBORNE PULSE DOPPLER RADAR

B. L. Trotter, R. G. Strauch, and C. L. Frush (National Center for Atmospheric Research) Jul. 1981 65 p
(PB82-156860; NOAA-TM-ERL-WMPO-45; NOAA-81103011) Avail: NTIS HC A04/MF A01 CSCL 04B

Doppler measurements installed in the aircraft which measure the radial velocities in light to heavy precipitation and in nonturbulent to turbulent meteorological situations was evaluated. The base line noise level in the system increased whenever video returns were present. The minimum detectable signal at the system output was approximately minus 100 dBm. It is shown that the system can be used in an airborne environment. Errors in velocity measurements will occur if the exact antenna spacial pointing angle is not known. The magnitude of error in the measurement is a function of the error in the known antenna position and the ground speed of the aircraft. GRA

The optimal control model for pilot/vehicle analysis is used to investigate the closed-loop consequences of the performance limitations associated with a computer generated image (CGI) visual system and a six degree-of-freedom motion simulator (VMS) in a helicopter hover task. The specific problem addressed was to determine the potential effects of CGI and VMS system characteristics on closed-loop hover performance and pilot workload, and to evaluate these effects in light of performance/workload levels we might expect to see in the actual flight situation. TRAINING AIRCRAFT DESIGN CONSIDERATIONS BASED ON THE SUCCESSIVE ORGANIZATION OF PERCEPTION IN MANUAL CONTROL

Robert K. Heffley, Warren F. Clement, and Samuel J. Craig (Vought Corp., Hawthorne, Calif.) *In* MIT Proc. of the 16th Ann. Conf. on Manual Control 1980 p 119-127 refs

Avail: NTIS HC A99/MF A01 CSCL 01C

Pilot skill development in the approach and landing task is very strongly tied to the aircraft closure rate and, therefore, pilot training for this task should be based on an appropriate progression closure rate. This, in turn, leads to a rational and explicit determination of design point approach speeds as well as other important aerodynamic features for training aircraft. One key is to recognize the significance of transitioning from a purely compensatory control loop technique to one involving a pursuit crossfeed between throttle and pitch attitude. Such transitioning requires significant skill development, yet reduces pilot workload while enhancing flight path and airspeed performance. The second key is to address the terminal flight path adjustment in terms of range-to-go. This establishes a bridge between the visual field and the combination of manual control technique and vehicle flight dynamics. A design summary plot is thus created in terms of: (1) performance (flight path bandwidth); (2) critical range-to-go (for terminal path correction); and (3) closure rate. Author

EFFECTS OF HIGHER ORDER CONTROL SYSTEMS ON AIRCRAFT APPROACH AND LANDING LONGITUDINAL HANDLING QUALITIES

Muhammad A. Pasha (Pakistan Air Force), John J. DAzo, and James T. Silverthorn *In* MIT Proc. of the 16th Conf. on Manual Control 1980 p 254-264 refs

Avail: NTIS HC A99/MF A01 CSCL 01C

A study of approach and landing longitudinal flying qualities, based on data generated by Calspan using a variable stability NT-33 aircraft combined with significant control system dynamics is presented. An optimum pilot lead time for pitch tracking, flight path angle tracking, and combined pitch and flight path angle tracking tasks is determined from a closed-loop simulation using integral squared error (ISE) as a performance measure. Pilot gain and lead time were varied in the closed-loop simulation of the pilot and aircraft to obtain the best performance for different control system configurations. The results lead to the selection of an optimum lead time using ISE as a performance criterion. Using this value of optimum lead time, a correlation is then found between pilot rating and performance with changes in the control system and in the aircraft dynamics. It is also shown that pilot rating is closely related to pilot workload which, in turn, is related to the amount of lead which the pilot must generate to obtain satisfactory response. The results also indicate that the pilot may use pitch angle tracking for the approach task and then adds flight path angle tracking for the flare and touchdown. Author

PILOT OPINIONS OF SAMPLING EFFECTS IN LATERAL DIRECTIONAL CONTROL

Robert F. Stengel and George E. Miller *In* MIT Proc. of the 16th Ann. Conf. on Manual Control 1980 p 265-270 refs

(Contract N00014-78-C-0257)

Avail: NTIS HC A99/MF A01 CSCL 01C

Flight experiments with a microprocessor control system were conducted to determine the effects of variations in sampling parameters on several pilots' opinions of lateral-directional flying qualities. Princeton's Variable Response Research Aircraft, which is equipped with a microprocessor-based digital flight control system was the test vehicle. Two U.S. Navy pilots evaluated the effects of sampling rate, quantization, and pure time delay during tracking, approach, and landing. Aircraft carrier approach tasks were conducted using a Navy approach mirror. Acquisition and tracking of fixed objects on the ground provided additional information related to the Navy mission. EVALUATION OF A TRAJECTORY COMMAND CONCEPT FOR MANUAL CONTROL OF CARRIER APPROACHES AND LANDINGS

Walter E. McNeill, G. Allan Smith, Jr., and Ronald M. Gerdes *In* MIT Proc. of the 16th Ann. Conf. on Manual Control 1980 p 370-392 refs

Avail: NTIS HC A99/MF A01 CSCL 01C

A trajectory control system concept for providing manual control of a conventional jet aircraft is described. The total aircraft flight control system (TAFCOS) utilizes an inverse model of the aerodynamic and propulsion characteristics and employs feedforward control to provide the required acceleration command. On-board digital computations which can easily be handled by a modern airborne computer are required. The system was studied in a piloted simulation of the carrier approach and landing task with primarily visual flight and guidance cues. The principal modes of vertical flight path control investigated were vertical velocity command and vertical acceleration command. The study included manual carrier approaches with and without moderate ship motion and associated air disturbances, and tests of the effects of discrete gusts. Manual control of flight path through this concept was shown to be feasible as an addition to an automatic control system and to have potential as an improved mode of control over conventional control for the carrier approach task. The concept also offers several advantages, among which are design flexibility, automatic compensation for external disturbances, and prevention of abusive pilot control. Author

APPLICATION OF A PILOT CONTROL STRATEGY IDENTIFICATION TECHNIQUE TO A JOINT FAA/NASA GROUND BASED SIMULATION OF HEAD UP DISPLAYS FOR CTOL AIRCRAFT

Wayne F. Jewell *In* MIT Proc. of the 16th Ann Conf. on Manual Control 1980 p 395-409 refs

(Contracts NAS2-10385; DOT-FA77WAI-725; NASA-NMI-1052.151)

Avail: NTIS HC A99/MF A01 CSCL 01D

The development, evaluation, and application of a technique for measuring a pilot's control strategy is described. The nonintrusive pilot identification program (NIPIP) estimates the pilot's input-output describing function and combined pilot vehicle performance parameters such as crossover frequency and phase margin by using a time domain model of the pilot and a least squares identification algorithm. It functions in realtime and uses a 'sliding' time window to maintain freshness in the data; thus time varying characteristics in the pilot's control strategy can be measured. The application of NIPIP to a realtime ground based simulation of two competing concepts of head up displays (HUD) for use in conventional takeoff and landing aircraft. Differences in the pilot's control strategy used for the two HUDs and the head down display are quantified in terms of differences in the pilots' describing functions and combined pilot vehicle measurements. Conclusions based on the performance evaluation and application of NIPIP are presented and some recommendations on how NIPIP could be used in other manual control tasks are discussed. J.D.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering – A Continuing Bibliography* (NASA SP-7037) lists 272 reports, journal articles, and other documents originally announced in November 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

certification is expected in December 1982 for commercial service the following year. A.B.

A82-43278 † Proposed multipurpose flying radio-physical laboratory using an IL-18 aircraft (Perspektivnaia mnogotselevaia radiofizicheskaia letaiushchaia laboratoriia na baze samoleta tipa IL-18). V. S. Abliazov, N. A. Armand, A. N. Beliunov, V. M. Berezanskii, L. F. Borodin, V. L. Bulatnikov, A. N. Vystavkin, A. A. Kalinkevich, A. A. Kirilin, and A. P. Kulakov. *(Vsesoiuznaia Konferentsiia po Problemam Issledovaniia Prirodnykh Resursov Zemli i Mirovogo Okeana Aviatsionno-Kosmicheskimi Sredstvami, Moscow, USSR, Nov. 1980.) Geodeziia i Aerofotos'emka*, no. 2, 1982, p. 11-18. In Russian.

The paper describes an airborne laboratory for performing radio-physical experiments relating to the remote sensing of earth resources and the monitoring of the environment in the microwave, infrared, and visual ranges. Consideration is given to the onboard automated data acquisition system, the radiometer system, and an algorithm for processing and classifying the radiometer data. A picture showing the arrangement of remote-sensing equipment and processing systems on the aircraft is presented along with block diagrams of the data-acquisition and radiometer systems. B.J.

A82-43311 A laser-interferometer method for determining the forces on a freely-flying model in a shock-tunnel. L. Bernstein and G. T. Stott (Queen Mary College, London, England). *Aeronautical Quarterly*, vol. 33, Aug. 1982, p. 237-257. 19 refs.

An interferometric method is developed for following the trajectory of a weakly restrained model in a shock tunnel where the force levels are of order 10N for flow duration of about 1 ms. The system consists of two simple Michelson interferometers and a single He-Ne laser that provides two measurement and reference beams for following the motion of two points on the model. Interference fringes are produced at the detectors as the model moves, and the resulting frequency-modulated wave-trains are recorded. The data are analyzed by curve fitting to a parabola in order to find the accelerations of the measurement points, and the forces on the model are calculated based on the model's internal characteristics. A lift and pitching moment for a ridge-delta of aspect-ratio 1 is obtained by suitably aligning the beams. In addition, results of tests on two models of the same geometric size but with different inertias are presented. N.B.

A82-43326 # The testing of new technologies with the aid of the Alpha Jet aircraft (Erprobung neuer Technologien am Alpha Jet). M. Natter (Dornier GmbH, Friedrichschafen, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über angewandte Flugwissenschaften bei der Entwicklung des Alpha Jet, Darmstadt, West Germany, Sept. 24, 1981, Paper.* 31 p. In German.

The Alpha Jet aircraft as weapon system of the 1980s and 1990s represents the most modern, operationally utilizable status of technology. The origin of the currently employed technologies goes back to the late 1960s. The present investigation is concerned with recent developments regarding the technologies which determine bomber aircraft design, taking into account the advantages that the new technologies will provide for future bomber aircraft. Technological changes of the 1970s are related to electronics and cybernetics, fluid mechanics and flight physics, and materials and methods of construction. The development, manufacture, and long-term testing of carbon-fiber reinforced plastics is considered, giving attention to the landing flap, rudder, elevator unit, and the wings of the Alpha Jet. The development and flight testing of a transonic wing is discussed, and a description is presented of the development and testing of a direct side force control system. G.R.

A82-43327 # Applied flight mechanics in the design and in flight tests (Angewandte Flugmechanik bei der Auslegung und Flugerprobung). H. Wünnenberg (Dornier GmbH, Friedrichshafen, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über angewandte Flugwissenschaften bei der Entwicklung des Alpha Jet, Darmstadt, West Germany, Sept. 24, 1981, Paper.* 22 p. 5 refs. In German.

It is pointed out that flight mechanics played an important part in connection with the design and the development of the Alpha Jet aircraft. The main criteria involved in a selection of the optimal configuration were related to a satisfaction of the requirements of flight mechanics. The German aerospace company engaged in the Alpha Jet project has already proposed seven alternative configurations for a jet trainer in connection with a prestudy. Factors used in comparing these configurations were related to flight mechanics, system costs, safety, structure, problems of construction, equipment, and employment possibilities as a light weapons system. The degree with which the flight-mechanics requirements were satisfied was determined on the basis of 17 criteria. Attention is also given to the procedures used in the development phase of the aircraft and the test phase. G.R.

A82-43328 # Processes and procedural approaches in the aerodynamic design of the Alpha Jet aircraft (Verfahren und Vorgehensweise bei der aerodynamischen Auslegung des Alpha-Jet). D. Welte (Dornier GmbH, Friedrichshafen, West Germany). Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über angewandte Flugwissenschaften bei der Entwicklung des Alpha Jet, Darmstadt, West Germany, Sept. 24, 1981, Paper. 18 p. In German.

The military aircraft Alpha Jet, which has been developed jointly by a French and a German aerospace company, is to be used as a training aircraft for novices and advanced students, and also as a combat aircraft to provide support to troops fighting on the ground. A description is presented of the approaches used to develop a design which will ensure the aerodynamic characteristics required by the aircraft to perform its missions. Attention is given to aspects of wing design, aids for obtaining satisfactory lift characteristics, engine inlets, jet effects, and a wind tunnel program. G.R.

A82-43330 # Aerodynamic computational procedures for subsonic and transonic aircraft (Aerodynamische Berechnungsverfahren für Unterschall- und Transschallflugzeuge). W. Schmidt. (Dornier GmbH, Friedrichshafen, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über angewandte Flugwissenschaften bei der Entwicklung des Alpha Jet, Darmstadt, West Germany, Sept. 24, 1981, Paper.* 25 p. 22 refs. In German.

The improvement of the flight characteristics of modern aircraft has been accompanied by a considerable increase in the aircraft development costs. Current procedures in connection with the aerodynamic design are still characterized by wind-tunnel studies. The use of modern aerodynamic computational processes will make it possible to restrict cost-intensive wind tunnel tests in the future to tests related to the verification of configuration characteristics and the determination of maneuverability properties. The development of the Alpha Jet aircraft is used as an example to show the advances which have been made regarding the development of aerodynamic computational procedures since the period from 1969 to 1973. Attention is given to the aerodynamic sizing program, the predesign of the wing-fuselage combination, profile design for sonic and transonic conditions, the design of flap systems, the design of engine inlets, and the aerodynamic design of the tail assembly. G.R.

A82-43331 # Processes and procedural approaches used in the dimensioning of the supporting structure and the demonstration of the airworthiness (Verfahren und Vorgehensweise bei der Dimensionierung der Tragstruktur und beim Nachweis der Lufttüchtigkeit). E. Hässler (Dornier GmbH, Friedrichshafen, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über angewandte Flugwissenschaften bei der Entwicklung des Alpha Jet, Darmstadt, West Germany, Sept. 24, 1981, Paper.* 26 p. In German.

The airworthyness of an aircraft is related to the ability of the airframe of the aircraft to tolerate the stresses occurring in flight operations in a satisfactory manner. On the other hand, a strength of the airframe exceeding the requirements to a large degree is also undesirable in connection with a corresponding unnecessary increase in the weight of the aircraft. The present investigation is concerned with the approaches used to obtain an airframe with optimum design characteristics, taking into account the procedures employed in connection with the design of the Alpha Jet aircraft. Attention is given to details regarding the airworthyness requirements in the case of the Alpha Jet, the optimal dimensioning of the airframe, questions of load mechanics, the structural calculations, and approaches for ensuring appropriate quality. G.R.

A82-43332 # A survey regarding the German-French development program Alpha Jet (Überblick über das deutsch-französische Entwicklungsprogramm Alpha Jet). P. Kania (Dornier GmbH, Friedrichshafen, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über angewandte Flugwissenschaften bei der Entwicklung des Alpha Jet, Darmstadt, West Germany, Sept. 24, 1981, Paper.* 27 p. In German.

The project Alpha Jet has its origin in the late 1960s, when in Germany and in France a need for a new jet trainer for the air force was recognized. Initial contacts between German and French aerospace companies in 1968 led to plans for the development of the Alpha Jet aircraft in a joint project by French and German companies. In response to the need of the 'Luftwaffe' for a combat aircraft providing close-air support, the development objectives for the Alpha Jet were extended to cover also requirements concerning an employment of the aircraft for combat missions. In September 1975, Belgium became the third partner in the Alpha Jet project. The last of four prototypes of the Alpha Jet performed its first flight on October 11, 1974. Attention is given to details concerning the implementation of the Alpha Jet program, organizational questions, aspects of the program schedule, financial considerations, and an outlook regarding future developments involving the Alpha Jet. G.R.

A82-43333 # Simulation in connection with the development of the Alpha Jet aircraft (Simulation bei der Entwicklung des Alpha Jet). H. Friedrich (Dornier GmbH, Friedrichshafen, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über angewandte Flugwissenschaften bei der Entwicklung des Alpha Jet, Darmstadt, West Germany, Sept. 24, 1981. Paper.* 37 p. In German.

A survey is provided of simulation studies conducted by a German aerospace company as an aid in the development of the Alpha Jet military aircraft. The first simulations were unmanned simulations, involving six degrees-of-freedom calculations. The simulation, including preprogrammed control input data or simulated pilot behavior, was performed by a digital computer. At a later time, a cockpit mock-up was provided with control elements and instruments, and the resulting installation was connected with a digital computer. In this connection, an operational simulator was developed. This simulator is used for air/ground mission applications. Investigations involving manned simulations are also discussed. Manned simulations were almost exclusively performed in connection with the adaptation of the aircraft to modified and new missions. The simulator is principally employed for mission simulations and the study of new control concepts. G.R.

A82-43394 Sensitivity analysis and optimization of aeroelastic stability. A. P. Seiranian. *International Journal of Solids and Structures*, vol. 18, no. 9, 1982, p. 791-807. 42 refs.

An analysis of the sensitivity characteristics of aeroelastic stability with respect to changes of distributed and discrete parameters is presented using variational analysis. The optimization problem of aeroelastic stability of a slender wing in incompressible flow is formulated and the solution demonstrates that this problem possesses at least two extrema, but that one of them is only a local maximum. Sensitivity analysis of flutter systems is developed by deriving the gradients of flutter and divergence critical speeds, and obtaining the necessary optimality conditions. The solution technique is then described and numerical results are presented. The optimality conditions for the distribution of nonstructural mass along the wing span are established and the bang-bang optimal distributions are obtained. N.B.

A82-43400 # Methodology in flight tests (Methodik bei der Flugerprobung). U. von Meier (Dornier GmbH, Friedrichshafen, West Germany). *Deutsche Gesellschaft fur Luft- und Raumfahrt, Symposium uber angewandte Flugwissenschaften bei der Entwicklung des Alpha Jet, Darmstadt, West Germany, Sept. 24, 1981, Paper.* 19 p. In German.

Cost considerations in connection with the conduction of flight tests make it necessary to conduct performance and property measurements, individual system tests, and flutter studies during the same flight. Flight tests conducted with the Alpha Jet aircraft provide a good example for efficient bilateral flight testing procedures. Four prototypes were used in the flight tests. Attention is given to the assignment of the various test problems to the Alpha Jet prototypes, the flight program for the test flights, aspects of performance evaluation, the excitation of structural vibration and the evaluation of the vibrations for the flutter analysis, and a survey concerning the testing of the weapons of the aircraft. G.R.

A82-43402 Mode scatterer design for fan noise suppression in two-dimensional ducts. M. S. Tsai (Boeing Commercial Airplane Co., Seattle, WA). *Journal of Sound and Vibration*, vol. 83, Aug. 22, 1982, p. 501-512. 11 refs.

The favorable scattering associated with the transfer of the lower order modal energies to the higher ones can be induced only when (1) the lower frequency waves propagate in the inlet duct or in the no mean flow conditions, and (2) the first lining which the incident waves from the fan face meet is a nearly reactive one. The phases of the incident waves from the noise source will affect the performance of the scatterer, but not the selection of the optimized scatterer. For a given baseline lining, the reactance and the length of the scatterer are the coupling factors in the determination of an optimized scatterer. (Author)

A82-43425 Northrop ECM - From B-1B to F-5E. D. Richardson. *Flight International*, vol. 122, Sept. 4, 1982, p. 683, 684, 693.

Several electronic countermeasures systems are described. The B-1 RFS/ECM jamming transmitter system has been extended to cover Band 8, as well as 6 and 7; in-phase power stacking allows the output of individual jamming sources to be combined, and phased array antennas are employed. The ALQ-171 (V) conformal countermeasures system, designed for the F-5, has a minimal effect on aircraft performance, reducing the maximum Mach number less than 4 percent at 36,000 feet. Continuous-power amplitude-modulation noise, a constant-power AM pulse repeater, and a continuous wave repeater are employed singly or in combination, and are effective against multiple threats. Future developments include the Modularised Infrared Transmitting Set consisting of an infrared transmitter and electronic control unit which provides 180 degree countermeasures coverage. A.B.

A82-43458 A field guide for scanner and photographic missions. D. L. Hawley (EG & G, Inc., Multispectral Remote Sensing Dept., Las Vegas, NV). In: American Society of Photogrammetry and American Congress on Surveying and Mapping, Fall Technical Meeting, San Francisco, CA, September 9-11, 1981 and Honolulu, HI, September 14-16, 1981, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. 513-530. 6 refs.

The guide comprises separate sections for planning, executing, and evaluating a multispectral scanner and/or photographic mission. The planning section addresses mission objectives, mission requirements, navigation, flight briefing, weather, communications, field/aircraft equipment, and logistics. The mission requirements deal with general flight parameters of sunrise, sunset, equation of time, solar altitude, solar azimuth, duration of daylight, duration of civil twilight, duration of astronomical twilight, flight line headings, flight altitude, flight line coverage, flight line interval, and number of flight lines. Among the scanner parameters discussed are the velocity/height ratio, scanner speed, and tape speed. Navigation techniques are described, together with aircraft considerations. C.R.

A82-43465 Loran-C navigation as an aid to aerial photographic operations. C. W. Dull (U.S. Department of Agriculture, Forest Service, Doraville, GA) and W. H. Clerke (U.S. Department of Agriculture, Forest Service, Atlanta, GA). In: American Society of Photogrammetry and American Congress on Surveying and Mapping, Fall Technical Meeting, San Francisco, CA, September 9-11, 1981 and Honolulu, HI, September 14-16, 1981, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. 531-541. 13 refs.

The navigational accuracy obtained during a wide variety of operational aerial photographic missions utilizing a Loran-C TDL-424 navigator is evaluated. The navigational displays, steering, and data outputs are discussed, and the parallel track steering and preprogrammed flight pattern are shown. The navigational accuracy evaluation includes a parallel flightline evaluation for three missions, a comparison of an aerial photographic mission with and without Loran-C, evaluation of return flight accuracy for a predescribed flightline, and overflights of predetermined exposure stations. C.D.

A82-43571 # Implicit model-following technique - Application to the design of longitudinal stability augmentation systems. V. Mocanu (National Institute for Scientific and Technical Research, Bucharest, Rumania). *Revue Roumaine des Sciences Techniques, Série de Mécanique Appliquée*, vol. 26, Nov.-Dec. 1981, p. 845-853. 13 refs.

Implicit model-following and static decoupling techniques are applied to the design of a control and stability augmentation system for a control-configured, relaxed static stability version of the F-4 aircraft. Implicit model-following allows the computation of the optimal feedback law which minimizes differences between aircraft and model dynamics for the cases of distinct flying qualities. The static decoupling technique is used for the computation of a feedforward matrix which decouples the steady state system outputs. O.C.

A82-43577 Technology for tomorrow's business aircraft. M. Grangier. *Interavia*, vol. 37, Sept. 1982, p. 875, 876.

Improvements of business aircraft by the end of the decade are forecast, which pertain to their structure, aerodynamics, propulsion and avionics. The increased use of composite materials in place of metal should reduce the empty weight of aircraft about 20 percent, but problems with testing and residual strength after damage must be resolved. Aerodynamic changes may include the use of new wing shapes, canard foreplanes, and wings with relative thicknesses of more than 15 percent at the root, aspect ratios over 10, and a sweep of 35 percent or more. It is hoped that engine power output will be increased 30 percent over current units by increasing the bypass ratio or by modifying the fan blade shape. Improved energy efficiency is to be expected from all of these changes. A.B.

A82-43578 Piston engines for general aviation - Is the revolution really under way. M. Grangier. *Interavia*, vol. 37, Sept. 1982, p. 898-900.

The search for higher efficiency, lower fuel consumption engines for general aviation is prompting the consideration of alternative fuels and engine designs. The Thunder engine, based on a McLaren/Chevrolet 8 cylinder automobile engine, is being developed to produce 700 HP at 4,400 rpm with fuel consumption of 0.40 pounds/HP/ hour and to run on a variety of fuels. Liquified petroleum gas is an attractive alternative fuel because its cost is 40-60 percent less than aviation gasoline with less pollution and engine carbon deposits; conversion of conventional engines is relatively simple, and it does not alter the flying characteristics of an aircraft. Alcohol is a possible fuel, but it gives lower engine performance than gas and could call for altitude restrictions. Diesel power is being considered through a 2 stroke 4 cylinder star configuration diesel for NASA. Finally, weight and cooling present problems to be overcome, as well as the high pressure fuel injection system necessary. A.B.

A82-43579 The cruise missile era dawns. J. P. Geddes. *Interavia*, vol. 37, Sept. 1982, p. 919-923.

In December 1982, 192 cruise missiles will be deployed on 16 B-52's, and will be the first out of over 4,000. In addition to the ALCM, the Tomahawk SLCM will be produced in several versions for surface launch, submarine launch and ground launch, the last of which will become operational in mid-1984. All these versions employ common propulsion and internal guidance systems with Terrain Contour Matching, and have a cruise speed of 550 mi/h and a range of 1550 nmi. A fifth version, the Medium Range Air-to-Surface Missile, will become operational in late-1986. The size of the anticipated production is made possible by the missile's low cost (about $1 million), and is made necessary by its vulnerability, considering and Walter M. Hollister *In its* Proc. of the 16th Ann. Conf. on Manual Control 1980 p 424-438 refs

The F-16 control configured vehicle (CCV) flight test program, and current aircraft display research are reviewed and task oriented and compensatory displays to further enhance the capability of the F-16 CCV are suggested. The fixed base M.I.T. 707 simulator was modified to represent the F-16 CCV. An isometric sidearm control stick and two axis CCV thumb button were installed in the cockpit. The forward cockpit CRT was programmed to present an external scene (numbered runway, horizon) and the designed heads up display. The cockpit interior was modified to represent a fighter and the F-16 CCV dynamics and direct lift and side force modes were programmed. Compensatory displays were designed from man/machine considerations. Pilots evaluated the heads up display and compensatory displays during simulated descents in the presence of several levels of filtered, zero mean wind gusts. During a descent from 2500 feet to the runway, the pilots tracked a point on the runway utilizing the basic F-16, F-16 CCV, and F-16 CCV with advanced displays. Substantial tracking improvements resulted utilizing the CCV modes, and the displays were found to even further enhance the tracking ability of the F-16 CCV. J.D.

SEPARATION MONITORING WITH FOUR TYPES OF PREDICTORS ON A COCKPIT DISPLAY OF TRAFFIC INFORMATION
Sharon Jago and Everett Palmer *In* MIT Proc. of the 16th Ann. Conf. on Manual Control 1980 p 439-447 refs

Avail: NTIS HC A99/MF A01 CSCL 01D

The concept of a cockpit display of traffic information (CDTI) includes the integration of air traffic, navigation, terrain and weather information in a single electronic display in the cockpit. Investigations designed to develop a clear and concise display format for use in later full mission simulator evaluation of the CDTI concept are described. The experiment required airline pilots to monitor a CDTI and make perceptual judgments concerning the future position of a single intruder aircraft in relationship to their own aircraft (ownship). The main experimental variable was the type of predictor used to display future position of each aircraft. Predictors were referenced to the ground or to ownship and they either included turn rate information or did not. Other variables were the aircraft's separation distance when the judgment was required and the type of encounter (straight or turning). Results indicate that under these experimental conditions fewer errors were made when the predictor included turn rate information. There was little difference in overall error rate for the curved ground referenced and the ownship referenced predictors. Author

COMPUTER ARCHITECTURE STUDY FOR VTXTS SIMULATORS Final Report, Mar. - Nov. 1981
Leonard D. Healy, Gerald A. Wyndle, and Bruce Baker (Servos and Simulation, Inc.) Apr. 1982 123 p refs
(AD-A115006; NAVTRAEQUIPC-IH-336) Avail: NTIS HC A06/MF A01 CSCL 09/2

This report provides an evaluation of computer configurations that might be applied to VTXTS simulators. Computers ranging from the large, general purpose computer ordinarily used in data processing to the microcomputer which requires 40 separate units to implement a simulator complex are considered. Eleven computer configurations are evaluated with respect to availability, maintenance, expandability, risk and life cycle cost. The information is summarized in a table of advantages and disadvantages of the various configurations. Author (GRA)

DESIGN OF A MICROPROCESSOR-CONTROLLED LINKAGE FOR SIMULATOR APPLICATIONS Final Report, Oct. 1980 - Jun. 1981
Leonard D. Healy Apr. 1982 82 p
(AD-A115421; NAVTRAEQUIPC-IH-334) Avail: NTIS HC A05/MF A01 CSCL 09/2

This report describes a method of linking a host computer to external devices and presents an implementation of such a system using multiple microcomputers. The technique used takes advantage of the statistical properties of simulator data to reduce the amount of data transferred, thereby insuring that those variables that change are updated with minimum delay. Implementation of linkage using multiple microcomputers provides a modular system easily tailored to various simulator applications. Author (GRA)

ADVANCED RELIABILITY MODELING OF FAULT-TOLERANT COMPUTER-BASED SYSTEMS
Salvatore J. Bavuso May 1982 33 p refs
(NASA-TM-84501; NAS 1.15:84501) Avail: NTIS HC A03/MF A01 CSCL 09B

Two methodologies for the reliability assessment of fault tolerant digital computer based systems are discussed. The computer-aided reliability estimation 3 (CARE 3) and gate logic software simulation (GLOSS) are assessment technologies that were developed to mitigate a serious weakness in the design and evaluation process of ultrareliable digital systems. The weak link is based on the unavailability of a sufficiently powerful modeling technique for comparing the stochastic attributes of one system against others. Some of the more interesting attributes are reliability, system survival, safety, and mission success.

The method involved the selection of three airports which were dominated by aircraft weighing 12,500 lbs or under and which were also undergoing a change relative to utilization. Also, there was interest in airports with different utilization levels so that effect of number of operations could be considered. In addition, there was a requirement to select airports with communities in the surrounding areas which were exposed to aircraft operations noise. Noise annoyance response data was obtained from available sources. These sources included environmental impact statements, interviews with airport managers, noise complaint information, community meetings concerned with projected changes in airport utilization, and social survey data. As a means of objectively assessing the noise impact due to aircraft operations, noise measurement and computer noise modeling determinations were obtained for each airport. Listening quality tape recordings were also obtained. Author

NOISE AND ECONOMIC CHARACTERISTICS OF AN ADVANCED BLENDED SUPERSONIC TRANSPORT CONCEPT
John K. Molloy, William D. Grantham, and Milton J. Neubauer, Jr. Sep. 1982 32 p refs
(NASA-TP-2073; L-15297; NAS 1.60:2073) Avail: NTIS HC A03/MF A01 CSCL 01B

Noise and economic characteristics were obtained for an advanced supersonic transport concept that utilized wing body blending, a double bypass variable cycle engine, superplastically formed and diffusion bonded titanium in both the primary and secondary structures, and an alternative interior arrangement that provides increased seating capacity. The configuration has a cruise Mach number of 2.62, provisions for 290 passengers, a mission range of 8.19 Mm (4423 n.mi.), and an average operating cruise lift drag ratio of 9.23. Advanced operating procedures, which have the potential to reduce airport community noise, were explored by using a simulator. Traded jet noise levels of 105.7 and 103.4 EPNdB were obtained by using standard and advanced takeoff operational procedures, respectively. A new method for predicting lateral attenuation was utilized in obtaining these jet noise levels. Author

A DOUBLET LATTICE METHOD FOR THE DETERMINATION OF ROTOR INDUCED EMPENNAGE VIBRATION AIRLOADS. ANALYSIS DESCRIPTION AND PROGRAM DOCUMENTATION
Santu T. Gangwani Jun. 1982 68 p refs
(Contract NAS1-16058)
(NASA-CR-165893; NAS 1.26:165893; UTRC81-7) Avail: NTIS HC A05/MF A01 CSCL 01A

An efficient state-of-the-art method was developed to determine the unsteady vibratory airloads produced by the interaction of the main rotor wake with a helicopter empennage. This method was incorporated into a computer program, Rotor Induced Empennage Vibration Analysis (RIEVA). The program requires the main rotor wake position and the strength of the vortices locates near the

A simplified approach to the free wake analysis of
a hovering rotor
A82-38474

Calculation of level flow using radial grating
A82-38922

Flight dynamics of rotorcraft in steep high-g turns
[AIAA PAPER 82-1345] A82-39117

Theory and application of optimum airloads to
rotors in hover and forward flight
A82-40506

Wind tunnel modeling of rotor vibratory loads
A82-40516

Predesign study for an advanced flight research
rotor
A82-40525

A semiempirical high-speed rotor noise prediction
technique
A82-40554

Dynamic surface measurements on a model helicopter
rotor during blade slap at high angles of attack
A82-40555

An experimental and numerical study of 3-D rotor
wakes in hovering flight
A82-40946

Aerodynamic interactions between a 1/6-scale
helicopter rotor and a body of revolution
A82-40947

Investigation of a rotor system incorporating a
constant lift tip
[NASA-CR-166261] N82-29271

Establishment of a rotor model basis
[NASA-TP-2026] N82-29311

ROTOR BLADES

The effect of hybrid composite materials on the
dynamic characteristics of helicopter rotor blades
A82-39263

Effect of tip vanes on the performance and flow
field of a rotor in hover
A82-40511

Helicopter vibration reduction by rotor blade
modal shaping
A82-40514

*Finite element analysis for bearingless rotor
blade aeroelasticity*
A82-40517

Helicopter vibration suppression using simple
pendulum absorbers on the rotor blade
[NASA-CR-169131] N82-28282

ROTOR BLADES (TURBOMACHINERY)

A simplified approach to the free wake analysis of
a hovering rotor
A82-38474

Fluctuating forces and rotor noise due to
distorted inflow
A82-40945

Establishment of a rotor model basis
[NASA-TP-2026] N82-29311

ROTOR LIFT

Investigation of a rotor system incorporating a
constant lift tip
[NASA-CR-166261] N82-29271

ROTOR SYSTEMS RESEARCH AIRCRAFT

Performance of the Rotor Systems Research Aircraft
calibrated rotor loads measurement system
A82-40549

ROTORCRAFT AIRCRAFT

Cooled variable nozzle radial turbine for rotor
craft applications
[NASA-CR-165397] N82-29323

ROTORS

The nonsynchronous whirls of the turbine rotor in
aerojet engines
A82-40944

ROUTES

Maximizing South Carolina's aviation resources:
Identifying potentially profitable commuter
airline routes, volume 2
[PB82-139353] N82-29277

RUNWAYS

Water-compatible polymer concrete materials for
use in rapid repair systems for airport runways
[DE82-010994] N82-29464

S

S-N DIAGRAMS

A roadmap toward a fatigue qualification process
for modern technology helicopters
A82-40542

SAAB AIRCRAFT

Design and experience with a low-cost digital
fly-by-wire system in the SAAB JA37 Viggen A/C
A82-40905

SAFETY DEVICES

Aircraft post-crash fire fighting/rescue
N82-29287

SAFETY MANAGEMENT

Aircraft fire safety
[AGARD-LS-123] N82-29279

Human response to fire
N82-29281

Aviation fuels-future outlook and impact on
aircraft fire threat
N82-29282

Fuel system protection methods
N82-29283

Aircraft post crash fire reduction/survivability
enhancement from a manufacturer's viewpoint
N82-29286

SATELLITE LIFETIME

Prelaunch estimates of near Earth satellite
lifetimes using quasi-dynamic atmosphere models
- application to a proposed Brazilian satellite
[INPE-2325-PRE/080] N82-29307

SATELLITE OBSERVATION

Scanner imaging systems, aircraft
N82-28713

SCALE MODELS

An experimental investigation of a bearingless
model rotor in hover
A82-40512

An investigation of scale model testing of VTOL
aircraft in hover
A82-40911

An improved propulsion system simulation technique
for scaled wind tunnel model testing of advanced
fighters
A82-41018

Research model wing/tail fabrication --- transonic
wind tunnel *1/7.5-scale* model
[AD-A114101] N82-

Investigation of correlation between full-scale
and fifth-scale wind tunnel tests of a Bell
helicopter Textron Model 222
[NASA-CR-166362] N82-

SEAT BELTS
Crashworthiness studies: Cabin, seat, restraint, and injury findings in selected general aviation accidents
[AD-A114878] N82-29275
SEATS
Crashworthiness studies: Cabin, seat, restraint, and injury findings in selected general aviation accidents
[AD-A114878] N82-29275
SELF INDUCED VIBRATION
Dynamic load measurements with delta wings undergoing self-induced roll-oscillations
[AIAA PAPER 82-1320] A82-39098
SENSORS
Primary-data devices --- Russian book
A82-39279
SEPARATED FLOW
Symposium on Flows with Separation, Stuttgart, West Germany, November 23-25, 1981, Reports
A82-38781
Lateral aerodynamics of delta wings with leading edge separation
[AIAA PAPER 82-1386] A82-39142
Analysis of jet transport wings with deflected control surfaces by using a combination of 2- and 3-D methods
A82-41022
SEQUENTIAL ANALYSIS
The Shiryayev sequential probability ratio test for redundancy management
[AIAA 82-1623] A82-38998
SERVICE LIFE
Determination of load spectra and their application for keeping the operational life-proof of sporting airplanes
A82-41010
The role of the scale parameter in service load assessment and simulation --- of aircraft flight
A82-41011
SERVOCONTROL
An analysis of a nonlinear instability in the implementation of a VTOL control system during hover
[AIAA 82-1611] A82-38990
SH-3 HELICOPTER
Development of the Sea King composite main rotor blade
A82-40539
SHALE OIL
An exploratory research and development program leading to specifications for aviation turbine fuel from whole crude shale oil. Part 1: Preliminary process analyses
[AD-A112681] N82-28462
An exploratory research and development program leading to specifications for aviation turbine fuel from whole crude shale oil. Part 2: Process variable analyses and laboratory sample production
[AD-A112682] N82-28463
An exploratory research and development program leading to specifications for aviation turbine fuel from whole crude shale oil. Part 3: Production of specification of JP-4 fuel from geokinetics shale oil
[AD-A112683] N82-28464
United States Air Force shale oil to fuels, phase 2
[AD-A114531] N82-29476
SHARP LEADING EDGES
On embedded flow characteristics of sharp edged rectangular wings
[LOG-C4712] N82-29263
SHEAR STRENGTH
Tests of CFRP spar/rib models with corrugated web
A82-39890
SHEAR STRESS
Calculation of the cross section properties and the shear stresses of composite rotor blades
A82-38475
In-plane shear test of thin panels
A82-40545
SHOCK FRONTS
Design study for a low-distortion holographic HUD
[AD-A113902] N82-28292
SHORT HAUL AIRCRAFT
Short range tactical ASW system
A82-39730
SHORT TAKEOFF AIRCRAFT
Application of advanced exhaust nozzles for tactical aircraft
[illegible]
Design and experimental verification of the USB-flap structure for NAL STOL aircraft --- Upper Surface Blowing
A82-40917
Development of the Circulation Control Wing-Upper Surface Blowing powered-lift system for STOL aircraft
A82-40963
Test results of chordwise and spanwise blowing for low-speed lift augmentation
A82-40999
Design of a longitudinal ride-control system by Zakian's method of inequalities
A82-41114
SIDESLIP
Effects of vortex breakdown on longitudinal and lateral-directional aerodynamics of slender wings by the suction analogy
[AIAA PAPER 82-1385] A82-39141
Lateral aerodynamics of delta wings with leading edge separation
[AIAA PAPER 82-1386] A82-39142
Flight-determined correction terms for angle of attack and sideslip
[AIAA PAPER 82-1374] A82-40290
Low-speed characteristics of a fighter-type configuration at high angles-of-attack and sideslip
A82-41020
SIGNAL ANALYZERS
Error minimization in ground vibration testing --- of helicopter structures
A82-40550
SIGNAL GENERATORS
Inflight IFR procedures simulator
[NASA-CASE-MSC-11210-1] N82-29231
SIGNAL PROCESSING
A recursive terrain height correlation system using multiple model estimation techniques
[AIAA 82-1513] A82-38937
Parameter estimation applied to general aviation aircraft - A case study
[AIAA PAPER 82-1313] A82-38894
Moving target detector (Mod 2)
[AD-A114709] N82-29520
SIGNAL RECEPTION
Simulation of correlation-extremal receivers of signals from sampling-phase radio-navigation systems
A82-39404
SIKORSKY AIRCRAFT
Sikorsky ACAP preliminary design --- Advanced Composite Airframe Program
A82-40536
SIMULATION
Laboratory-scale simulation of underground coal gasification: Experiment and theory
[DE82-001063] N82-28470
SKIN (STRUCTURAL MEMBER)
Non-honeycomb F-16 horizontal stabilizer structural design
A82-40534
Design considerations and experiences in the use of composite material for an aeroelastic research wing
[NASA-TM-83291] N82-28290
SKIN FRICTION
Measurement and visualization of skin friction on the leeside of delta wings in supersonic flow
A82-38785
Correlation of Preston-tube data with laminar skin friction (Log No. J12984)
[NASA-TM-84827] N82-29386
SLENDER WINGS
Effects of vortex breakdown on longitudinal and lateral-directional aerodynamics of slender wings by the suction analogy
[AIAA PAPER 82-1385] A82-39141
SLOTTED WIND TUNNELS
Aerodynamic behavior of a slender slot in a wind tunnel wall
[illegible]
Measuring the flow properties of slotted test-section walls
[FFA-135] N82-28871

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction)

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

exposure to enemy counter-measures for some three hours before reaching target. Nuclear arming requires 24 flight events, and occurs only in the target area. Future developments center on enabling small engines to run at 3000 C for more power and range. A.B.

A82-43583 **What has hypersonics research led to - Some examples of progress and spin off /17th Handley Page Memorial Lecture/.** J. L. Stollery (Cranfield Institute of Technology, Cranfield, Beds., England). *Aerospace* (UK), vol. 9, Sept. 1982, p. 14, 15, 21-26. 23 refs.

Hypersonic flight poses considerable problems due to the high kinetic heating, the great power required, and the difficulties in maintaining structural integrity. Temperatures over 1000 K are encountered, and installed thrust must equal maximum takeoff weight. The retractable spike on the Trident Missile was one of the first applications of a technique which prevents the boundary layer from becoming a bow shockwave, and reduces kinetic heating. Because no wind tunnel duplicates all the aspects of hypersonic flight, the flights of the Space Shuttle provided the opportunity to evaluate theoretical predictions of the aerodynamic conditions at speeds from Mach 27 to 0.9. Spin-offs from hypersonic research include the intermittent shock tube and the gasdynamic laser as well as developments for power cells and magnetohydrodynamics. A proposed laser powered hypersonic aircraft is also discussed. A.B.

A82-43588 **Aeronautical research and development in Europe - Perspectives (La recherche et le développement aéronautiques en Europe - Perspectives).** J. C. Wimpenny (British Aerospace Public, Ltd., Co., Aircraft Group, Kingston-upon-Thames, Surrey, England). *(Journée des Pionniers Européens, 7th, Toulouse, France, May 6, 1982.) L'Aéronautique et l'Astronautique,* no. 94, 1982, p. 3-15. In French.

Processes of design-to-cost, construction, and use of aircraft up to the year 2000 are discussed, with attention given to the purposes, directions, and constraints on research and development. Factors influencing the commercial R&D activities are identified as competition and increases in the market, which should expand at least over the extent of the period covered. The demand for new services is driven by attempts to capture markets outside the country of origin, faster flights between locations, and the cost of operations. Raises in fuel costs create new markets for manufacturers to satisfy demands of commercial customers for greater flight economy. Collaborative efforts by different European companies in R&D activities are reviewed, along with specific program goals to lower manufacturing costs and extend the lifetime of the aircraft. M.S.K.

A82-43589 **Parietal jets. I (Les jets pariétaux. I).** L. Rosenthal (Centre de Documentation de l'Armement, Paris, France). *L'Aéronautique et l'Astronautique,* no. 94, 1982, p. 17-30. 25 refs. In French.

Analytical models are explored for the characteristics of jet flow over a wall in order to describe the performance features of parietal jets in varying applications. Attention is given to physically modeling the characteristics of the Coanda and Young effects, particularly in the case of a jet exhaust directed over an inclined flat plate. Experimental studies with free stream velocities equal to zero are reviewed, and numerical models for conditions where the freestream velocity is not equal to zero are noted to require either an integral or a finite difference method for solution of the separation point. Applications of the parietal jets in helicopter blades, STOL aircraft, engines, thrust reversers, and fluidics are mentioned. M.S.K.

A82-43603 † **Survey and design of airfields (Izyskaniia i proektirovanie aerodromov).** G. I. Glushkov, V. F. Babkov, L. I. Goretskii, and A. S. Smirnov. Moscow, Izdatel'stvo Transport, 1981. 616 p. 15 refs. In Russian.

The fundamentals of airfield and airport design are reviewed with reference to the current requirements and standards, including those of ICAO and State Standard of the USSR, and results of the latest research in this area. Topics discussed include airport layout, calculation of the airfield size, vertical planning of the airfield, drainage systems, design of airfield pavements, design of unpaved airfields, heliports, airfields for VTOL aircraft, and, finally, surveying and project development. V.L.

A82-43659 **NASA studies business aircraft avionics.** B. M. Elson. *Aviation Week and Space Technology,* vol. 116, Apr. 26, 1982, p. 119, 121, 125 (4 ff.).

NASA is evaluating an approach to digital avionics using as a testbed a two-engine Cessna 402B equipped with a demonstration advanced avionics system (DAAS). DAAS functions include autopilot/flight directing, navigation/flight planning, flight warning, and weight and balance computations, and examples of system capabilities are air traffic control Mode S message processing, built-in testing, and ground simulation. Built around eight bus-connected microprocessors, DAAS uses digital implementations of the algorithms used for defining the analog autopilot, and incorporates some KFC 300 features. Selector switch, bug selection, and wind velocity are also considered. Cost constraints impose the storage of 10 navigation aids and 10 waypoints, and the use of a small CRT, but some research is being done in flat panel technology and also the use of low-cost inertial sensors should compensate for these problems. R.K.R.

A82-43660 # **Theoretical and experimental investigation of some nonlinear characteristics of electrohydraulic servovalves (Theoretische und experimentelle Untersuchung einiger nichtlinearer Eigenschaften elektrohydraulischer Servoventile).** M. Rizk. Stuttgart, Universität, Fakultät für Luft- und Raumfahrttechnik, Dr.-Ing. Dissertation, 1981. 119 p. 29 refs. In German.

Electrohydraulic control methods are used in a number of applications, including those related to positioning operations performed in connection with the control of aircraft. These control methods are based on the employment of electrohydraulic servovalves. The characteristics of the servovalves have an essential effect on the system behavior. However, the information available concerning the nonlinearities with respect to these characteristics is in many respects insufficient. The present investigation is concerned with a theoretical and experimental study of all possible nonlinear characteristics of electrohydraulic servovalves, with the exception of hysteresis. An open loop control system was built for the conduction of the experiments. The effect of the bypass choke valve on the pressure sensitivity of the first hydraulic stage is calculated, while aspects of hydraulic stiffness in the second stage are experimentally studied. Attention is given to the effect of magnetic and hydraulic saturation on valve characteristics, the effect of manufacturing tolerances, and the effect of the supply pressure. G.R.

A82-43724 # **An examination of the dynamics of rotary machines (Contribution à l'étude dynamique des machines tournantes).** R. Henry. Lyon I, Université, Docteur d'Etat ès-Sciences Thesis, 1981. 167 p. 74 refs. In French.

Numerical models are developed and tested experimentally for accuracy in modeling static and dynamic behaviors of disk-blade systems in conditions of equal or unequal rigidity of the disks and blades. The static and dynamic analyses of thin blades in rotation are carried out through a finite element method, with the choice of elements, boundary values, and matrices being discussed. Attention is given to the calculation of frequencies and modes of repetitive circular systems, with mention made of potential and kinetic energy analyses of substructures using reduced matrices. A computer program, DISCO, is introduced and applied to a disk-blade lattice and an annular plate. The frequencies and modes of an industrial centrifugal compressor wheel are calculated and compared to data, and an accuracy of 5 percent is demonstrated to be possible at cost effective levels of computation. M.S.K.

A82-43742 **A fatigue crack growth theory based on strain energy density factor.** R. Badaliance (McDonnell Aircraft Co., St. Louis, MO). In: Absorbed specific energy and/or strain energy density criterion; Proceedings of the International Symposium, Budapest, Hungary, September 17-19, 1980. The Hague, Martinus Nijhoff Publishers, 1982, p. 329-345. 7 refs.

The strain energy density at the crack tip is used to characterize the fatigue crack growth behaviro of metallic materials. Having postulated that the rate of crack propagation is a function of the range of the strain energy density, this range is used to correlate subcritical growth data of certain aluminums, titaniums, and steels. A parameter which incorporates yield stress, true ultimate stress, and stress ratio is devised to account for stress ratio effects. A single crack growth curve for each material is developed by numerical procedures, and these constant amplitude curves are then used in conjunction with cycle-by-cycle integration schemes to predict spectrum fatigue lives of center cracks and elliptic surface flaws in plates subjected to fighter aircraft landing gear stress history. The results show good agreement with data from experimental tests. N.B.

A82-43753 # **An implicit finite-volume method for solving the Euler equations.** A. Lerat (Ecole Nationale Supérieure d'Arts et Métiers; Paris VI, Université, Paris, France), J. Sidès, and V. Daru (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Conférence Internationale sur les Méthodes Numériques en Dynamique des Fluides, 8th, Aachen, West Germany, June 28-July 2, 1982.) ONERA, TP* no. 1982-59, 1982. 8 p. 10 refs.

Although the explicit methods which have been developed for the solution of steady or unsteady transonic flow Euler equations allow the prediction of supercritical flows around airfoils without restriction on shock wave strength and motion, they are computing time-intensive due to the limitation on the time step required for numerical stability. This limitation is removed through the application of the present, second-order and noniterative implicit method for the solution of Euler equations. An important feature of the present method is that the implicit terms are of the order of the truncation error, allowing simpler and easier treatment of boundary conditions. The method is expressed in the finite volume formulation and applied to both steady and unsteady transonic flows. The computing time reduction achieved while obtaining accurate results is noted. O.C.

A82-43755 # **Laser Doppler anemometry applied to the study of the airflow in the wake of an helicopter rotor.** B. Sellier and J. Pigere (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(International Symposium on Applications of Laser-Doppler Anemometry to Fluid Mechanics, Lisbon, Portugal, July 5-7, 1982.) ONERA, TP* no. 1982-61, 1982. 12 p. 6 refs.

The equipment, instrumentation and results of a laser Doppler anemometry study of helicopter rotor wake airflow are described. Azimuthal and radial distributions of vertical induced velocities and tip vortex paths are determined for the cases of hovering and forward flight. Attention is given to the arrangement of the laser velocimeter system and the data acquisition system, which can operate in both a 'wake' and a 'histogram' mode. The former simultaneously obtains the two induced velocities and the angular position of the blade, while in the latter, velocities are measured for one given azimuthal blade location. O.C.

A82-43756 # **Preliminary experiments on a centrifugal research compressor using a laser -2- focus velocimeter.** J. Labbe, G. Janssens, and P. Avram (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(International Symposium on Applications of Laser-Doppler Anemometry to Fluid Mechanics, Lisbon, Portugal, July 5-7, 1982.) ONERA, TP* no. 1982-62, 1982. 10 p. 5 refs.

Laser velocimetry methods suitable for the measurement of turbomachine flow velocities must take into account the periodicity of rotation and minimize secondary effects caused by laser light reflection from shroud, hub and impeller surfaces. These difficulties are greatest in centrifugal compressors due to shape of the casing, blade geometry, and the complexity of flow geometry near the blade tips. A two-focus laser velocimeter is described whose mean values, measured outside the centrifugal compressor impeller studied, are in accordance with those determined in the same test section by classical pressure probe methods. O.C.

A82-43757 # **Application of laser velocimetry to large industrial wind-tunnels.** A. Boutier and M. Canu (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(International Symposium on Applications of Laser-Doppler Anemometry to Fluid Mechanics, Lisbon, Portugal, July 5-7, 1982.) ONERA, TP* no. 1982-63, 1982. 11 p. Research supported by the Direction des Recherches, Etudes et Techniques.

Laser velocimetry has been recently applied in two large industrial transonic wind-tunnels at Modane. In S3 Modane, a blow-down facility, a velocity map has been obtained around a model, with a two-dimensional laser velocimeter using forward scattered light and two XYZ benches, one on each side of the test section: the whole velocimeter was monitored by a mini computer during the runs. At S2 Modane, preliminary experiments have shown that a laser velocimeter can be operated in a pressurized chamber and can provide good results, if some precautions indicated in the paper are taken. (Author)

A82-43792 **Recent results in main beam nulling.** R. N. Adams, W. G. Brodsky, L. L. Horowitz, and K. D. Senne (MIT, Lexington, MA). In: ICC '81; International Conference on Communications, Denver, CO, June 14-18, 1981, Conference Record. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 10.5.1-10.5.5. USAF-sponsored research.

The use of an adaptive, multibeam antenna, which nulls main-beam interferers while tracking and receiving the friendly signal, can significantly reduce the size of the link outage region which results when interferers pass through the main beam of a receiving antenna aboard an aircraft. A multibeam adaptive antenna system which responds to these technical requirements has been designed and partially fabricated. Details of the system design are reviewed, as are preliminary results of laboratory and antenna test range experiments. (Author)

A82-43821 **The aviation route forecast /ARF/ program - An interactive system for pilot self-briefing.** E. M. Gross, T. Laufer (NOAA, National Weather Service, Silver Spring, MD), and T. R. Mitchell (Mitre Corp., Bedford, MA), and F. J. Steckbeck (FAA, Washington, DC). In: ICC '81; International Conference on Communications, Denver, CO, June 14-18, 1981, Conference Record. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 32.1.1-32.1.9. 19 refs.

A more effective procedure of making weather information available to the user would lead to a significant improvement in weather services. A description is presented of the evolution of the Pilot Self-Briefing program and the Aviation Route Forecast (ARF) development effort. These two program efforts have been integrated so that users can directly acquire weather information tailored by the computer to their specific interests. As presently constituted, the ARF concept is oriented toward aviation, but the basic hardware, software, and algorithms could be adapted to other forecasting applications. Attention is given to the background regarding the pilot self-briefing development, the ARF concept and development, the ARF output processing rationale, the ARF output organization, pilot self-briefing data reduction due to ARF, past ARF testing, future ARF testing, and the need for forecaster analysis support systems. B.R.

A82-43840 **Electronic warfare system measure of effectiveness.** A. B. Glenn (Mitre Corp., McLean, VA). In: ICC '81; International Conference on Communications, Denver, CO, June 14-18, 1981, Conference Record. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 36.6.1-36.6.5.

A methodology is proposed to determine the measure of effectiveness (MOE) of systems used in electronic warfare (EW). This MOE will use a combination of both qualitative and quantitative measures which are based on the EW systems test data, the threat environment, and the necessary mathematical analysis. The MOE which is quantitative gives a more accurate indication of the EW effectiveness than the commonly used qualitative measures of high-medium-low. A simple example is given to illustrate how the MOE of an anti-jam (AJ) Ground Control Intercept (GCI) communications system can be determined for a specific hypothetical scenario. (Author)

A82-43870 **Combined amplitude-phase modulation for a VHF communication link.** G. Renelli, G. Borghi, V. Cappellini, E. Del Re, and S. Guidi (Firenze, Università, Florence, Italy). In: ICC '81; International Conference on Communications, Denver, CO, June 14-18, 1981, Conference Record. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 56.6.1-56.6.6. 6 refs.

In this work a combined amplitude-phase modulation communication system is considered. Amplitude modulation is used to transmit a voice signal, phase modulation is used for data transmission. Such a scheme was studied as a possible realization of a data channel between aircraft and ground stations. The performance of the combined modulation system is evaluated through computer simulation in the two cases AM-PSK and AM-MSK. (Author)

A82-43888 **A new class of routing protocols for a proposed computer network linking tactical radar sites.** C. Warner (U.S. Naval Ocean Systems Center, San Diego, CA) and J. Spragins (Clemson University, Clemson, SC). In: ICC '81; International Conference on Communications, Denver, CO, June 14-18, 1981, Conference Record. Volume 4. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 73.6.1-73.6.10. 6 refs.

An advanced forward area tactical radar network, which has been studied for the Air Force Electronic Systems Division, can be viewed as a novel form of computer network, sharing many of the problems of more standard computer networks but with other unique problems resulting from the specialized nature of the application. This network will link together a number of short range tactical radars, each with associated data processing equipment, spaced at nominal distances of approximately 30 miles, and enable each radar site to have a complete file of tracks for all targets seen by any radar in the network. In addition, the communication network is expected to be used for transmission of a variety of other types of command and control messages. As part of the design of this network, a new class of distributed and adaptive routing protocols has been developed. The results of simulation studies of these routing algorithms are presented. (Author)

A82-44051 # **Generation of boundary-conforming grids around wing-body configurations using transfinite interpolation.** L. E. Eriksson (Flygtekniska Forsoksanstalten, Bromma, Sweden). *AIAA Journal*, vol. 20, Oct. 1982, p. 1313-1320.

A computational procedure for generating three-dimensional nonorthogonal surface-fitted mesh systems around wing-fuselage configurations is presented. The method is based on the concept of transfinite interpolation, which has been extended to handle very general mapping function specifications at the boundaries, thereby making it possible to generate single-block mappings with geometry data specified only at the outer boundaries of the computational domain. Since it is a direct algebraic mapping technique, the method is very inexpensive in terms of computer cost. Different types of possible mappings are compared with respect to resolution and economy of nodal points. A procedure for a novel type of mapping, designated type O-O, is described and several plots of generated grids demonstrate the capabilities of the method. The singular lines inherent in every three-dimensional mesh for this type of surface geometry are also discussed. (Author)

A82-44052 # **Damped Euler-equation method to compute transonic flow around wing-body combinations.** A. Rizzi (Flygtekniska Forsoksanstalten, Bromma, Sweden). *AIAA Journal*, vol. 20, Oct. 1982, p. 1321-1328. 22 refs. Research sponsored by the Forsvarets Materielverk.

Inviscid transonic flows containing either strong shock waves or complex vortex structure call for the Euler equations as a realistic model. Presented here is a computational procedure for solving the Euler equations for transonic flow around a wing and fuselage upon an O-O mesh generated by transfinite interpolation. An explicit time-marching finite-volume procedure solves the flow equations and features a nonreflecting far field boundary condition, an internal mechanism for temporal damping, and use of the local time step, all of which improve the convergence of the computation. Converged after several hundred iterations, results computed on the CYBER 203 vector processor are compared with experimental data and potential-flow computations. The Euler-equation model is found to predict the existence of a tip vortex created by inviscid flow separation in the downstream region of the tip of the M6 wing where the radius of curvature approaches zero. empennage surfaces. A nonlinear lifting surface analysis is utilized to predict the aerodynamic loads on the empennage surfaces in the presence of these concentrated vortices. The analysis was formulated to include all pertinent effects such as suction of the interacting vortices and the shed vorticity behind the empennage surfaces. The analysis employs a time domain solution. The output of the program consists of chordwise and spanwise airload distributions on the empennage surfaces. The airload distributions are harmonically analyzed and formulated for input into the Coupled Rotor/Airframe Vibration Analysis. Author

A PRESCRIBED WAKE ROTOR INFLOW AND FLOW FIELD PREDICTION ANALYSIS, USER'S MANUAL AND TECHNICAL APPROACH
T. A. Egolf and A. J. Landgrebe Jun. 1982 79 p refs
(Contract NAS1-16058)
(NASA-CR-165894; NAS 1.26:165894; UTRC81-2) Avail: NTIS HC A05/MF A01 CSCL 01A

A user's manual is provided which includes the technical approach for the Prescribed Wake Rotor Inflow and Flow Field Prediction Analysis. The analysis is used to provide the rotor wake induced velocities at the rotor blades for use in blade airloads and response analyses and to provide induced velocities at arbitrary field points such as at a tail surface. This analysis calculates the distribution of rotor wake induced velocities based on a prescribed wake model. Section operating conditions are prescribed from blade motion and controls determined by a separate blade response analysis. The analysis represents each blade by a segmented lifting line, and the rotor wake by discrete segmented trailing vortex filaments. Blade loading and circulation distributions are calculated based on blade element strip theory including the local induced velocity predicted by the numerical integration of the Biot-Savart Law applied to the vortex wake model. Mathematical development is presented for the expanded capabilities of the United Technologies Research Center (UTRC) G400 Rotor Aeroelastic Analysis. This expanded analysis, G400PA, simulates the dynamics of teetered rotors, blade pendulum vibration absorbers and the higher harmonic excitations resulting from prescribed vibratory hub motions and higher harmonic blade pitch control. Formulations are also presented for calculating the rotor impedance matrix appropriate to these higher harmonic blade excitations. This impedance matrix and the associated vibratory hub loads are intended as the rotor blade characteristics elements for use in the Simplified Coupled Rotor/Fuselage Vibration Analysis (SIMVIB). Sections are included presenting updates to the development of the original G400 theory, and material appropriate to the user of the G400PA computer program. This material includes: (1) a general description of the structuring of the G400PA FORTRAN coding, (2) a detailed description of the required input data and other useful information for successfully running the program, and (3) a detailed description of the output results. SINGULARITY EMBEDDING METHOD IN POTENTIAL FLOW CALCULATIONS
Wen-Huei Jou and Hung Huynh Jun. 1982 28 p refs
(NASA Order A-77471B)
(NASA-CR-166387; NAS 1.26:166387) Avail: NTIS HC A03/MF A01 CSCL 01A

The so-called H-type mesh is used in a finite-element (or finite-volume) calculation of the potential flow past an airfoil. Due to coordinate singularity at the leading edge, a special singular trial function is used for the elements neighboring the leading edge. The results using the special singular elements are compared to those using the regular elements. It is found that the unreasonable pressure distribution obtained by the latter is removed by the embedding of the singular element. Suggestions to extend the present method to transonic cases are given. Author

AXISYMMETRIC AND NON-AXISYMMETRIC EXHAUST JET INDUCED EFFECTS ON A V/STOL VEHICLE DESIGN. PART 2: ANALYSIS OF RESULTS
W. C. Schnell Jan. 1982 202 p refs
(Contract NAS2-9887)
(NASA-CR-166365; NAS 1.26:166365) Avail: NTIS HC A10/MF A01 CSCL 01A

A wind tunnel investigation, employing a 1/8 scale model in an 11 foot transonic wind tunnel (Mach 0.4-1.4), was conducted to determine the jet effects of several exhaust nozzles on the aeropropulsive performance of a V/STOL fighter design. The force and pressure data show that significant differences in aeropropulsion performance can be expected by varying the exhaust nozzle type, jet area and deflection angle on an underwing nacelle installation. At unvectored conditions, the single expansion ramp nozzles show large performance gains relative to a circular nozzle installation. Additionally, a further drag reduction is realized when the nonaxisymmetric nozzle is vectored through a 10 degree deflection angle. The combined payoff of the vectored nonaxisymmetric nozzle over the baseline circular nozzle installation is equivalent to 25 percent of zero lift drag. R.J.F.

AXISYMMETRIC AND NON-AXISYMMETRIC EXHAUST JET INDUCED EFFECTS ON A V/STOL VEHICLE DESIGN. PART 3: EXPERIMENTAL TECHNIQUE
W. C. Schnell Jun. 1982 115 p refs
(Contract NAS2-9887)
(NASA-CR-166147; NAS 1.26:166147) Avail: NTIS HC A06/MF A01 CSCL 01A

The jet induced effects of several exhaust nozzle configurations (axisymmetric, and vectoring/modulating variants) on the aeropropulsive performance of a twin engine V/STOL fighter design was determined. A 1/8 scale model was tested in an 11 ft. transonic tunnel at static conditions and over a range of Mach Numbers from 0.4 to 1.4. The experimental aspects of the static and wind-on programs are discussed. Jet effects test techniques in general, flow through balance calibrations and tare force corrections, ASME nozzle thrust and mass flow calibrations, test problems and solutions are emphasized. S.L.

SUPERCRITICAL MANEUVERING FIGHTER CONFIGURATION. WIND-TUNNEL INVESTIGATION AT MACH NUMBERS OF 0.60 TO 0.95

Michael J. Mann, Charles E. Mercer, and Richard L. Campbell
Sep. 1982 69 p refs
(NASA-TM-84513; L-15399; NAS 1.15:84513) Avail: NTIS HC A04/MF A01 CSCL 01A

A wind tunnel investigation was conducted to study the application of supercritical technology to highly maneuverable combat aircraft. The configuration studied has a leading-edge sweep of 45 deg and an aspect ratio of 3.28. Two supercritical-wing shapes were tested at Mach numbers from 0.60 to 0.95 with angles of attack from -2 deg to 17 deg. On supercritical wing was designed to achieve a high level of transonic maneuver performance at a Mach number of 0.90; however, excessive flow separation developed on this wing at a Mach number of 0.85. A second supercritical wing was tested which had significantly reduced flow separation and improved drag characteristics at a Mach number of 0.85 and maintained the performance of the original wing at the higher Mach numbers. Leading-edge vortex generators did not improve the performance of the second wing; however, a sharp leading-edge flap produced sizable drag reductions at Mach numbers from 0.60 to 0.90. Author

HYBRID STATE VECTOR METHODS FOR STRUCTURAL DYNAMIC AND AEROELASTIC BOUNDARY VALUE PROBLEMS

Larry Lee Lehman Washington NASA Aug. 1982 195 p refs
(Grant NGL-05-020-243)
(NASA-CR-3591; NAS 1.26:3591) Avail: NTIS HC A09/MF A01 CSCL 01A

A computational technique is developed that is suitable for performing preliminary design aeroelastic and structural dynamic analyses of large aspect ratio lifting surfaces. The method proves to be quite general and can be adapted to solving various two point boundary value problems. The solution method, which is applicable to both fixed and rotating wing configurations, is based upon a formulation of the structural equilibrium equations in terms of a hybrid state vector containing generalized force and displacement variables. A mixed variational formulation is presented that conveniently yields a useful form for these state vector differential equations. Solutions to these equations are obtained by employing an integrating matrix method. The application of an integrating matrix provides a discretization of the differential equations that only requires solutions of standard linear matrix systems. It is demonstrated that matrix partitioning can be used to reduce the order of the required solutions. Results are presented for several example problems in structural dynamics and aeroelasticity to verify the technique and to demonstrate its use. These problems examine various types of loading and boundary conditions and include aeroelastic analyses of lifting surfaces constructed from anisotropic composite materials. Author

SURFACE GENERATION FOR AERODYNAMIC APPLICATIONS

H. Sobieczky (DFVLR, Goettingen, West Germany) Jun. 1981 22 p refs
(Contract N00014-78-C-0182)
(AD-A116263; TFD-81-03) Avail: NTIS HC A02/MF A01 CSCL 20/4

This paper describes an analytical procedure to obtain the geometry of wing-body combinations, missiles, rotors and propellers, to be used in computational algorithms as well as for automated tool manufacturing wind tunnel models for flow-field analysis, with emphasis on parametrical shape variations needed in aerodynamic design and optimization procedures. Analytical shape definition allows for arbitrary surface coordinates generation to be combined with three dimensional (flow space) grid generators. Present version of the code (E38-A) defines the wing along sections at constant span, with smooth deviations near the wing root section, which is projected onto the body surface. The body is defined by cross-section shapes based on superelliptic arcs, connecting analytic crown lines and planform projection curves. Wing sections are defined by an analytical blending between given root and central sections for the inner part of the wing, and the same between the central and tip section for the outer part of the wing. These three basic airfoils may be given as dense data from preceding two dimensional design or as relatively few spline supports for an interpolation technique of suitably stretched ordinates in order to density airfoil data. MATERIALS AND DESIGN CRITERIA FOR KEVLAR-29 RIBBON PARACHUTES Final Report, 1 Sep. - 1 Mar. 1980

William R. Pinnell Apr. 1982 267 p refs
(AF Proj. 2402)
(AD-A116357; AFWAL-TR-81-3138) Avail: NTIS HC A12/MF A01 CSCL 01/3

This report contains information and design criteria for application of Kevlar-29 (intermediate modulus para-aramid) textile materials to ribbon parachutes. Textile materials for this application are listed, their properties and limitations discussed, and methods for tensile testing presented. Twenty degree conical continuous ribbon parachute test items were designed and fabricated using Kevlar-29 textile materials entirely. The results of air drop and sled track testing at subsonic and transonic conditions are presented and design criteria based on these results are reported. The effects of reefing (two stages) on aerodynamic performance of the 15.3 ft nominal diameter parachutes is also reported. The report treats joining techniques for kevlar-29 parachute components and presents the results of tensile tests of joint samples. Design considerations and fabrication techniques related to application of Kevlar-29 materials are included. A comprehensive list of references useful to the parachute or decelerator system designer is provided. Author (GRA)

REDUCTION IN PARACHUTE DRAG DUE TO FOREBODY WAKE EFFECTS

Carl W. Peterson and Donald W. Johnson 1981 10 p refs
Presented at the 7th AIAA Aerodyn. Decelerator and Balloon Technol. Conf., San Diego, Calif., 21 Oct. 1981
(Contract DE-AC04-76DP-00789)
(DE81-030124; SAND-81-0510C) Avail: NTIS HC A02/MF A01

The reduction in parachute drag due to forebody wake effects was predicted. The drag of a 20 deg conical ribbon parachute was measured at several axial stations behind an ogive cylinder forebody with and without fins. The same parachute was tested in undisturbed flow (where wake effects were negligible) so that the effects of suspension line length on parachute drag could be separated from the drag losses caused by the turbulent wake. Total head pressure surveys were made across the forebody wake and integrated across the canopy skirt area to determine the effective dynamic pressure acting on the parachute. Experimental results confirmed the validity of the underlying physical model of the parachute/wake interaction: the ratio of parachute drag behind a forebody divided by wake-free parachute drag is equal to the ratio of effective dynamic pressure acting on the parachute divided by freestream dynamic pressure. Maximizing South Carolina's aviation resources: Identifying potentially profitable commuter airline routes, volume 2 [PB82-139353] N82-29277
SPACE SHUTTLE ORBITERS
NASA Dryden's experience in parameter estimation and its uses in flight test [AIAA PAPER 82-1373] A82-39135
SPACECRAFT DESIGN
CDS-the designer's media, the analyst's model --- Configuration Development System for aircraft A82-40991
SPANWISE BLOWING
Close-coupled canard-wing vortex interaction and Reynolds stress acquisition [AIAA PAPER 82-1368] A82-39132
An experimental investigation of leading-edge spanwise blowing A82-40988
Test results of chordwise and spanwise blowing for low-speed lift augmentation A82-40999
SPECIFICATIONS
An exploratory research and development program leading to specifications for aviation turbine fuel from whole crude shale oil. Part 1: Preliminary process analyses [AD-A112681] N82-28462
An exploratory research and development program leading to specifications for aviation turbine fuel from whole crude shale oil. Part 3: Production of specification of JP-4 fuel from geokinetics shale oil [AD-A112683] N82-28464
SPECTRAL SENSITIVITY
High-sensitivity holographic plates PL-3M A82-41575
SPEED INDICATORS
Correlation of Preston-tube data with laminar skin friction (Log No. J12984) [NASA-TM-84827] N82-29556
SPIN DYNAMICS
Applications of parameter estimation in the study of spinning airplanes [AIAA PAPER 82-1309] A82-39090
Prediction of high alpha flight characteristics utilizing rotary balance data A82-40953
SPIN TESTS
Prediction of high alpha flight characteristics utilizing rotary balance data A82-40953
Spin behaviour of the Pilatus PC-7 Turbo Trainer A82-40979
SPOILERS
Development of the advanced composite ground spoiler for C-1 medium transport aircraft A82-39895
SPOT WELDS
Fatigue behavior of weldbonded joints A82-41115
STABILITY AUGMENTATION
Guidance for the use of equivalent systems with MIL-F-8785C --- for aircraft flight control systems [AIAA PAPER 82-1355] A82-39124
STABILITY DERIVATIVES
Aerodynamic interactions between a 1/6 scale helicopter rotor and a body of revolution [NASA-TM-84287] N82-28283
STABILIZED PLATFORMS
Analyzing stable pad disturbances and design of a sensor vault to monitor pad stability [AIAA 82-1565] A82-39811
STABILIZERS (FLUID DYNAMICS)
Development status of a composite vertical stabilizer for a jet trainer A82-39897
A one-shot autoclave manufacturing process for carbon epoxy components A82-40935
Non-honeycomb F-16 horizontal stabilizer structural design A82-40936
STANDARDS
Perspectives of the flying qualities specification [AIAA PAPER 82-1354] A82-39123
Minimum operational performance standards for automatic direction finding (ADF) equipment [RTCA/DO-179] N82-28270
STATIC AERODYNAMIC CHARACTERISTICS
Methodology for determining elevon deflections to trim and maneuver the DAST vehicle with negative static margin [NASA-TM-84499] N82-28299
STATIC PRESSURE
Aerodynamic behavior of a slender slot in a wind tunnel wall A82-38381
Analysis and wind tunnel tests of a probe used to sense altitude through measurement of static pressure [AIAA PAPER 82-1361] A82-39128
Multistage axial compressor program on tip clearance effects [AD-A107445] N82-29325
STATIC STABILITY
Modal control of relaxed static stability aircraft [AIAA 82-1524] A82-38946
STATISTICAL ANALYSIS
Field studies of the Air Force procedures (NOISECHECK) for measuring community noise exposure from aircraft operations [AD-A113672] N82-28801
STATORS
Comparison of experimental and analytic performance for contoured endwall stators [AIAA PAPER 82-1286] A82-40422
STEREOPHOTOGRAPHY
The design of a viewing system for near real time stereo images from a UMA borne linescan sensor --- Unmanned Aircraft A82-39708
STIFFNESS MATRIX
Calculation of the cross section properties and the shear stresses of composite rotor blades A82-38[illegible]
STOCHASTIC PROCESSES
The correlation of flight test and analytic M-on-N air combat exchange ratios --- Many-on-Many [AIAA PAPER 82-1320] A82-39108
The role of the scale parameter in service load assessment and simulation --- of aircraft flight A82-41011
STRAKES
The use of small strakes to reduce interference drag of a low wing, twin engine airplane [AIAA PAPER 82-1323] A82-39106
STRESS (PHYSIOLOGY)
Special investigation report: Air traffic control system [PB82-1[illegible]2[illegible]6] N82-28217
STRESS ANALYSIS
Determination of load spectra and their application for keeping the operational life proof of sporting airplanes A82-4[illegible]
STRESS CONCENTRATION
Calculation of the cross section properties and the shear stresses of composite rotor blades A82-38[illegible]
STRESS INTENSITY FACTORS
Cracks interacting with contact forces - A finite element study on loaded holes A82-[illegible]

STRESS MEASUREMENT
  Performance of the Rotor Systems Research Aircraft calibrated rotor loads measurement system A82-40549

STRUCTURAL ANALYSIS
  Research on the behavior of a turbojet engine during internal and external disturbances with respect to early recognition of damage --- German thesis A82-40561
  Cooled variable nozzle radial turbine for rotor craft applications [NASA-CR-165397] N82-25323

STRUCTURAL DESIGN
  Efficient optimum design of structures - Program DDDU A82-38146
  Optimum structural design --- for helicopters A82-40543

STRUCTURAL DESIGN CRITERIA
  Helicopter vibration reduction by rotor blade modal shaping A82-40514
  Results of the AH-64 Structural Demonstration A82-40551

STRUCTURAL FAILURE
  On the bearing strengths of CFRP laminates A82-39930

STRUCTURAL VIBRATION
  Correlation of predicted vibrations and test data for a wind tunnel helicopter model A82-40515
  The nonsynchronous whirls of the turbine rotor in aerojet engines A82-40944
  Limiting performance of nonlinear systems with applications to helicopter vibration control problems [AD-A113239] N82-28301

SUBSONIC FLOW
  The unsteady motion of a wing traveling at subsonic speed above a plane A82-39358
  Ejector powered propulsion and high lift subsonic wing A82-40970
  Spanwise distribution of vortex drag and leading-edge suction in subsonic flow A82-41005

SUBSONIC FLUTTER
  Investigation of the unsteady airloads on a transport aircraft type airfoil with two interchangeable oscillating trailing edge flaps, at transonic speed and high Reynolds numbers A82-40909

SUBSONIC SPEED
  The use of linearized-aerodynamics and vortex-flow methods in aircraft design /invited paper/ [AIAA PAPER 82-1384] A82-40294

SUCTION
  Effects of vortex breakdown on longitudinal and lateral-directional aerodynamics of slender wings by the suction analogy [AIAA PAPER 82-1385] A82-39141
  Aerodynamic development of laminar flow control on swept wings using distributed suction through porous surfaces A82-40094
  Spanwise distribution of vortex drag and leading-edge suction in subsonic flow A82-41005

SUPERCRITICAL WINGS
  Improved solutions to the Falkner-Skan boundary-layer equation A82-38263
  Development of an advanced no-moving-parts high-lift airfoil A82-40971
  Design considerations and experiences in the use of composite material for an aeroelastic research wing [NASA-TM-83291] N82-28280

SUPERSONIC AIRCRAFT
  Forward-swept wings and supersonic zip A82-38216
  Optimal three-dimensional turning performance of supersonic aircraft [AIAA PAPER 82-1326] A82-39103
  Optimal control applications in supersonic aircraft performance A82-39374
  NASA research in supersonic propulsion - A decade of progress [AIAA PAPER 82-1048] A82-40417
  Calculations of transonic steady state aeroelastic effects for a canard airplane A82-40982
  An initial look at the supersonic aerodynamics of twin-fuselage aircraft concepts A82-41008

SUPERSONIC AIRFOILS
  Research model wing/tail fabrication --- transonic wind tunnel 1/7.5-scale model [AD-A114101] N82-28288

SUPERSONIC CRUISE AIRCRAFT RESEARCH
  Piloted simulator evaluation of a relaxed static stability fighter at high angle-of-attack [AIAA PAPER 82-1295] A82-39882
  Upper Vortex Flap - A versatile surface for highly swept wings A82-41003
  Analytical study of vortex flaps on highly swept delta wings A82-41007
  Wind-tunnel investigation of vortex flaps on a highly swept interceptor configuration A82-41006

SUPERSONIC FLIGHT
  Wing design for supersonic cruise/transonic maneuver aircraft A82-41021

SUPERSONIC FLOW
  Leading edge separation at delta wings with curved leading edges in supersonic flow A82-38784
  Measurement and visualization of skin friction on the leeside of delta wings in supersonic flow A82-38789
  Computation of supersonic flow around three-dimensional wings A82-40898

SUPERSONIC INLETS
  Intake swirl - A major disturbance parameter in engine/intake compatibility A82-41016

SUPERSONIC LOW ALTITUDE MISSILE
  Supersonic missile aerodynamic and performance relationships for low observables mission profiles [AIAA PAPER 82-1298] A82-39885

SUPERSONIC TRANSPORTS
  Advanced aerodynamic wing design for commercial transports - Review of a technology program in the Netherlands A82-40905

SUPPORT INTERFERENCE
  Summary of sting interference effects for cone, missile, and aircraft configurations as determined by dynamic and static measurements [AIAA PAPER 82-1366] A82-40295

SURFACE VEHICLES
  Requirements and trends in fuel consumption in transport mission with aircraft and surface vehicles A82-40984

SURVIVAL
  Aircraft fire safety [AGARD-LS-123] N82-29279
  Aircraft fire mishap experience/crash fire scenario quantitation N82-29280
  Human response to fire N82-29281
  Fuel system protection methods N82-29283
  Aircraft post crash fire reduction/survivability enhancement from a manufacturer's viewpoint N82-29286

SWEPT FORWARD WINGS
  Forward-swept wings and supersonic zip A82-38216
  X-29A flight control system design experiences [AIAA 82-1538] A82-39989
  High angle-of-attack characteristics of a forward-swept wing fighter configuration [AIAA PAPER 82-1322] A82-39099

Two approaches to the calculation of runway capacity are presented, and are compared by application to a specific situation. The analytic model provides point-by-point estimates of the capacity for given percentages of landings out of the total number of operations, but the relationship between capacity, input flow and average delays per aircraft cannot be determined. The simulation model, employing the Monte Carlo method, takes into consideration the input flows into the system, so average aircraft delays can be estimated and the relationship of the capacity to the values of the parameters can be determined. This makes the simulation model more suitable for the analysis of airport operation. A block diagram of the simulation model is included. A.B.

A82-44218 # **New approaches to fighter design.** *Dornier-Post* (English Edition), no. 3, 1982, p. 4-6.

The principles of the development of a cost-effective weapons system which could replace the Luftwaffe F-4 Phantom tactical combat aircraft are summarized. The first principle which Dornier has proposed is maximum fleet effectiveness, and the approach to this goal includes such considerations as determining the effects of aircraft, weapons, and equipment requirements on costs, evaluating the effects of requirements on combat effectiveness, and identifying cost-effective substitute performances. A second principle is that new technologies be developed which are based on cost-effectiveness criteria, rather than performance criteria. Criteria include the use of cost-effective carbon fiber materials, and plastic-formed and diffusion-bonded titanium components. The tailless all-wing aircraft is considered as an example of the integration of new technologies for new weapons systems capabilities. Operational analysis reveals that the dry thrust concept can match tactical fighters' combat performance, and, in some missions, offers a superiority of 50%. R.K.R.

A82-44219 # **New technologies for future fighters.** *Dornier-Post* (English Edition), no. 3, 1982, p. 7-10.

Recent activities underway at Dornier in the fields of aerodynamics and flight mechanics are presented. The Alpha Jet is being used to test a transonic wing (TST), which, compared to the standard wing, has an 18% thicker profile, advanced wing/fuselage blending, and maneuver flaps comprised of leading-edge slats and trailing-edge flaps. Tests have shown an improvement in drag-rise and buffeting limits, and the thicker wing permits carrying additional fuel without external tanks. The maximum lift coefficient has been increased by approximately 20%, allowing higher stationary and unstationary load factors, thus improved maneuverability. In addition, direct side force control (DSFC) tests, aimed at accelerating aircraft alignment, have shown that the system is good in all three axes, the drag control mode is effective with decelerations of up to 0.75 g in horizontal flight, and well-controlled steep dives at constant speed are possible. A combination of the TST and DSFC programs will be tested on a modified Alpha Jet. R.K.R.

A82-44220 # **Perspectives for the use of remotely piloted vehicles in military technology.** W. Klaar. *Dornier-Post* (English Edition), no. 3, 1982, p. 23-29.

An overview of remotely piloted vehicle (RPV) technology is presented in terms of crew replacement, design possibilities, and mission tasks. In air attack applications, one-way missile concepts are preferred, as they use airborne signal processing and need no remote pilot. Terrain contours have been used for en-route navigation, and more precise methods are being investigated. For mission planning, computer-based methods and systems must be used. In addition, unmanned carrier platforms and net recovery methods are being developed at Dornier. This recovery method reduces launch vehicle weight by 8-15%, and ensures well-controllable landing decelerations. Applications for unmanned systems include air target simulation, aerial reconnaissance, and electronic warfare tasks. R.K.R.

A82-44221 # **Image processing in tactical flight guidance.** *Dornier-Post* (English Edition), no. 3, 1982, p. 32-36.

Work performed by Dornier in the field of image processing in tactical flight guidance is presented. Image-forming sensors scan the scene and store the energy potential to form a TV image, and sensors are being designed for the infrared range and the millimeter wave range. To remove errors and imperfections from the image, preprocessing methods such as a two-dimensional high pass filter, a histogram for contrast spreading, and inverse filtering methods are used. An object recognition process is explained which involves a comparison between stored images and recently scanned area images. Pattern and feature recognition can be achieved by two approaches. The first is a direct image comparison (image point brightness value), and the second consists of transforming two images into a single feature space for comparison. Images which represent these processes are included. R.K.R.

A82-44222 # **Automated flight data processing.** K. Blumenwitz. *Dornier-Post* (English Edition), no. 3, 1982, p. 39-43.

The automated flight data processing (AFA) system for use in the Alpha Jet consists of six components which are (1) a digital computer with two disk drives, (2) an electronic cabinet with central voltage cutoff, (3) a single-color screen (38 cm x 28 cm), (4) a screen copier which supplies an A4 hardcopy of the screen display, (5) a printer with keyboard, and (6) an elevated and inclining map table. Stored meteorological data can be updated for a planned mission, and once they are verified, a low-level or a high-level mission, or any combination of the two, can begin. Due to time savings in low- and high-level flight planning, the pilot has more time to study the planned flight path and the available flight information. It is mentioned that the AFA has been designed such that it is adaptable to the requirements of other flying weapons systems. R.K.R.

A82-44223 # **Interactive graphics design with CODEM.** L. Thieme. *Dornier-Post* (English Edition), no. 3, 1982, p. 49-52.

The Computer-Graphics Augmented Design and Manufacturing System (CODEM) is user-optimized and can be connected to other program systems. CODEM offers a time savings in making precise drawings, resulting in a cost savings and a shorter project cycle time. Aspects to consider when the system is introduced include user participation during preparations, computer configuration planning which avoids lengthy response times, and well planned file organization and data security. In addition, it is found that a six-hour work day for each designer is required, and such tasks as short discussions and consulting, calculations, and looking up of standard components can be performed at the display. In order to ensure uninterrupted and transparent data transfer in the design, development, and production of the aircraft, link-ups with other program systems are made via the defined interfaces of CODEM. R.K.R.

A82-44224 # **The design of airfoil profiles with trailing edge loading in transonic flow (Conception de profils à charge arriere en écoulement transsonique).** E. Lavigne. *Toulouse, Conservatoire National des Arts et Métiers, Ingénieur en Aérodynamique Thesis, 1981. 112 p. In French. Research supported by the Service Technique des Programmes Aéronautiques.*

The results and techniques of a series of studies to define airfoil profiles with satisfactory characteristics in transonic flows are presented. An inverse numerical model for transonic flows past an airfoil is developed, along with techniques for a two-dimensional analysis of transonic flows coupled to a boundary layer. The results of trials performed in wind tunnels with perforated walls to diminish the intensity of reflected waves are presented, along with a description of the instrumentation, including 76 pressure sensors, photographic equipment, and carborundum bands to induce transition to separation. Results are presented for configurations producing higher maximum lift, augmented buffeting lift, and reducing drag. It is shown that increasing the trailing edge loading increases drag. M.S.K.

A82-44231 # **Radionavigation for civil aviation (La radionavigation de l'aviation civile).** O. Carel (Direction Générale à l'Aviation Civile, Paris, France). *Société des Electriciens, des Electroniciens et des Radioélectriciens, Journée d'Etudes sur l'Electronique dans l'Aéronautique, Nice, France, Nov. 26, 27, 1981, Paper 811760.* 17 p. In French.

Radionavigation systems involving beacons either on the ground or on satellites which transmit and receive signals from general aviation aircraft for fixing location and distance are reviewed. The systems are intended to allow flight in the shortest possible route, to aid in avoiding ground obstacles, to keep flight within controlled airspace and aid in avoiding air collisions, and to aid landing in safe and timely conditions. In France, ground based beacons comprise 160 radiocompasses, 30 VHF goniometers, 70 VOR installations, 80 ILS stations, 30 DME units, and the ILS successor, the MLS. Additionally, the Navstar global positioning system will eventually feature 18 satellites to give continuous worldwide coverage. The use of frequency synthesizers to allow high volume multiple access to DME units is noted, along with widespread use of the MLS to replace ILS beacons. Finally, the increasing radio noise from citizen band radios, television, and industry as a threat to VHF radionavigation systems' effectiveness is mentioned. M.S.K.

A82-44232 # **The ILS in Category III operations (L'ILS dans les opérations de Catégorie III).** J. P. Dupont (Direction Générale à l'Aviation Civile, Service Technique de la Navigation Aérienne, Paris, France). *Société des Electriciens, des Electroniciens et des Radioélectriciens, Journée d'Etudes sur l'Electronique dans l'Aéronautique, Nice, France, Nov. 26,t27, 1981, Paper 811761.* 19 p. In French.

The evolution of ground-based equipment for support of an inertial landing system (ILS) for the French national air routes is described, along with nominal functioning characteristics. The approach trajectory is defined by a track represented by a three degree angle from the ground which includes the point of touchdown. The ILS consists of two signals giving angular references within a limited volume. The signals register on the same display grid for the pilot, while the autopilot performs functions of maintaining center of gravity and aligning the aircraft in its approach, taking into account both lateral and longitudinal motions. Specific features of monitoring the radio beacons to assure accuracy are outlined, and attention is given to the certification process. All weather landing is made feasible by use of the ILS, even in conditions of extremely low ceiling. M.S.K.

A82-44233 # The flight management computer (Calculateurs de gestion du vol). J. Grossin (Société Nationale Industrielle Aérospatiale, Direction des Etudes, Toulouse, France). *Société des Electriciens, des Electroniciens et des Radioélectriciens, Journée d'Etudes sur l'Electronique dans l'Aéronautique, Nice, France, Nov. 26, 27, 1981, Paper 811762.* 23 p. In French.

Numerical models and their implementation into flight management computers to ensure maximum flight economies in the air transport industry are discussed. The FMC system comprises a data bank, a memory-filed flight plan, built-in programs for determining the position of the aircraft and optimizing the performance, a display system for alerting the pilot to autopilot actions or recommending actions, and a series of sensors to monitor the aircraft interior, the environment, and waypoints on the flight path. Optimization is shown to reside in minimizing both fuel consumption and the flight time. The flight is divided into three phases in the computer: ascent, cruise, and descent, with calculations proceeding through use of a singular perturbation algorithm. The necessity of the computer being able to receive and process data in-flight is stressed, and the implementation of bubble chips and magnetic disks is noted. M.S.K.

A82-44234 # Electronic aircraft stabilization (Stabilisation d'un avion par l'électronique). A. Chadeau (Ministère de la Defense, Service Technique des Télécommunications et des Equipements Aéronautiques, Paris, France). *Société des Electriciens, des Electroniciens et des Radioélectriciens, Journée d'Etudes sur l'Electronique dans l'Aéronautique, Nice, France, Nov. 26, 27, 1981, Paper 811763.* 13 p. In French.

The performance, components, circuitry, and degree of totality of electronic autopilots are discussed. The systems are noted to alleviate the pilot work load in cruise flight and bad weather conditions as well as correcting instabilities which are beyond human capability and freeing the pilot for other tasks, such as managing armaments. Electronic autopilots have been shown to be capable of maintaining trim in pitch and roll, stabilizing the flight slope, course, altitude, speed, the course as determined by fixed radio beacons, landing an aircraft, and in controlling flare. A block diagram is furnished of an electrohydraulic servocontrol system, and the limits of on board computers to calculate responses to changing demands are discussed, along with safety procedures. Finally, programmed features for limiting and assessing the gravity and probability of malfunctions are outlined. M.S.K.

A82-44235 # Air-air anticollision systems (Systèmes d'anticollision air-air). A. Michel (Direction Générale à l'Aviation Civile, Service Technique de la Navigation Aérienne, Paris, France). *Société des Electriciens, des Electroniciens et des Radioélectriciens, Journée d'Etudes sur l'Electronique dans l'Aéronautique, Nice, France, Nov. 26, 27, 1981, Paper 811764.* 47 p. In French.

The requirements for a successful air-air on-board anticollision system for aircraft are reviewed and test results to date on prototype equipment are discussed. The systems are noted to require the capability of detecting all possible collision dangers, must function at all times, offer clear avoidance paths, be compatible with air traffic control and other anticollision systems, function in controlled and uncontrolled airspace, have a low rate of false alarms, and be able to take into account multiple dangers in dense air traffic. Attention is given to BCAS (beacon collision avoidance system), a system equipped with a secondary radar set to detect the presence of other aircraft, measure the separation distance and altitude, discern those aircraft which pose a threat, and calculate an avoidance path. The safety maneuver can be done in coordination with the other aircraft's system if compatibility is present between the on-board systems. Block diagrams are furnished of a test system of the BCAS, along with an analysis of operational procedures. M.S.K.

A82-44236 # New image generators for the next generation of civil aircraft (Nouvelles visualisations pour la prochaine génération d'avions civils). M. Bernard and D. Giroux (Thomson-CSF, Division Equipements Avioniques, Malakoff, Hauts-de-Seine, France). *Société des Electriciens, des Electroniciens et des Radioélectriciens, Journée d'Etudes sur l'Electronique dans l'Aéronautique, Nice, France, Nov. 26, 27, 1981, Paper 811767.* 21 p. In French.

The results of studies of problems, benefits, and applications, and design of CRT displays for private aircraft are discussed. Particular attention is given to avionics for the Airbus A 310 and the A 300-600 aircraft, and the possibilities of enhancing the reliability of pilot data displays while reducing the volume necessary for cockpit instrumentation. The CRTs will produce color images, and in being coupled to the central computer, will permit the pilots to call up a wide range of data on any screen with the mode of display adapted for each stage of a flight. The displays will follow the flight path and provide changing parameters during takeoff and during automatic adaptation during velocity changes to maintain efficient flight under changing mass due to fuel being consumed. M.S.K.

A82-44238 # New trends and concerns in the airliner radio equipment market (Nouvelles tendances et nouvelles préoccupations sur le marché des équipements radio avions de ligne). H. Medioni (Electronique Aérospatiale, Le Bourget, Seine-Saint-Denis, France). *Société des Electriciens, des Electroniciens et des Radioélectriciens, Journée d'Etudes sur l'Electronique dans l'Aéronautique, Nice, France, Nov. 26, 27, 1981, Paper 811768.* 10 p. In French.

The types of new electronics for avionics communication and navigation displays which are currently available to airlines, and problems inherent in assuring that microprocessors installed on fleet aircraft are not made obsolescent in too short a time are discussed. Airline regulations in France which require the interchangeability of certain electronic equipment in order to assure, at least in the respect, the financial viability of making repairs to electronic equipment in a safe manner with a short down time are noted. One requirement for equipment such as multiplexers, multiemitters/multireceivers, and locators has been in operation at 1 Mbit/sec, while monoemitters in open switch position transmit at 12 kbit/sec. Problems which are expected to occur in flight-qualifying totally automated pilot systems, including landing systems, are explored. M.S.K.

A82-44239 # Satellite localization of aircraft accidents - The Sarsat program (La localisation par satellite des accidents d'avion - Le programme SARSAT). M. Leveque (Centre National d'Etudes Spatiales, Direction des Programmes et de la Planification, Paris, France). *Société des Electriciens, des Electroniciens et des Radioélectriciens, Journée d'Etudes sur l'Electronique dans l'Aéronautique, Nice, France, Nov. 26, 27, 1981, Paper 811765.* 24 p. In French.

Features of the search and rescue satellite aided tracking (Sarsat) system, which will aid in locating air and seacraft in distress conditions, are outlined. The first Sarsat will be launched in 1982 and a globally operating system is envisioned by 1990. The program, a joint effort by the U.S. and Canada beginning in 1976, was joined by the French in 1977 for coordination with the Sargos program, and by the Soviet Union for the Cospas program. Doppler location by Sarsat will comprise beacons operating between 121.5-243 MHz for demonstration purposes, and then use beacons at 406 MHz in cooperation with the Sargos system. Repeaters are used if a distress signal in the 121.5-243 MHz band is received by an NOAA spacecraft equipped with SAR. The distress signal is stored on board and transmitted by downlink to a ground station when the satellite recrosses the continental U.S. or Canada. M.S.K.

A82-44244 # Pneumatic tire model for aircraft simulations. J. R. Kilner (Boeing Military Airplane Co., Seattle, WA). *Journal of Aircraft*, vol. 19, Oct. 1982, p. 851-857. 5 refs. Research supported by the Boeing Military Airplane Co.

The development of a tire model for the prediction of vertical and drag loads in response to large discrete surface obstacles shorter than the tire footprint length is presented. The tire is modeled as a toroidal membrane with the objective of characterizing the enveloping properties of the tire. An explicit set of equations is used to calculate the tire footprint in contact with a user specified surface profile, the tire volume, the pneumatic pressure, and the resultant vertical and drag loads at the wheel axle. Tire carcass and bottoming loads are also predicted. The model is designed to be computationally efficient for use with aircraft digital taxi simulations. Model predictions are compared with tire test data for low-speed fixed axle excursions over short rectangular bumps and dips. Excellent quantitative correlation is demonstrated. (Author)

A82-44245 # Transonic flutter and response analyses of two 3-degree-of-freedom airfoils. T. Y. Yang (Purdue University, West Lafayette, IN) and C. H. Chen. *Journal of Aircraft*, vol. 19, Oct. 1982, p. 875-884. 33 refs. Grant No. AF-AFOSR-78-3523.

Time-response and flutter analyses are presented for a conventional and a supercritical airfoil which are oscillating with plunge, pitch and aileron pitch degrees-of-freedom (DOFs) in small disturbance transonic flow, using the LTRAN2-NLR transonic code to calculate aerodynamic characteristics. The flutter speeds associated with the bending-torsion branch of aeroelastic parameters are plotted against Mach number for different parameter values, and the transonic dip phenomenon is demonstrated. The flutter modes are studied by plotting the flutter speed, amplitude ratio, and phase difference at various Mach numbers against the mass ratio for both a 2DOF and a 3DOF case. Time-response results are given for the conventional and supercritical airfoils at Mach 0.85 and 0.765, respectively. O.C.

A82-44246 * # Higher-order flow angle corrections for three-dimensional wind tunnel wall interference. M. H. Rizk (Flow Research Co., Kent, WA). *Journal of Aircraft*, vol. 19, Oct. 1982, p. 893-895. 5 refs. Contract No. NAS1-16262.

A second-order theory including camber effects in wind tunnel wall interference corrections is described. Changes in the geometrical configuration of the model tested are avoided by introducing the camber correction as an equivalent angle-of-attack correction. Tabular and graphic data are presented which indicate improved accuracy for second-order over first-order theory. O.C.

A82-44291 Improving aircarrier water survival. C. T. Lindemann, Jr. (Air Line Pilots Association International, Washington, DC). *SAFE Journal*, vol. 12, Fall 1982, p. 11-13.

Existing deficiencies in planning, preparation and equipment for aircraft water accident survival are reviewed and recommendations made. Many approved seat cushions are not adequate flotation devices for passengers, because the required level of buoyancy is lost after a few minutes of use, and because users have

IDENTIFICATION OF TERMS TO DEFINE UNCONSTRAINED AIR TRANSPORTATION DEMANDS Final Report, 26 Mar. 1980 - 31 Aug. 1981
Ira D. Jacobson and A. Robert Kuhlthau Apr. 1982 60 p refs
(Contract NAS1-14908)
(NASA-CR-165961; NAS 1.26:165961; UVA/528194/MAE-CE82/101) Avail: NTIS HC A04/MF A01 CSCL 01C

The factors involved in the evaluation of unconstrained air transportation systems were carefully analyzed. By definition an unconstrained system is taken to be one in which the design can employ innovative and advanced concepts no longer limited by present environmental, social, political or regulatory settings. Four principal evaluation criteria are involved: (1) service utilization, based on the operating performance characteristics as viewed by potential patrons; (2) community impacts, reflecting decisions based on the perceived impacts of the system; (3) technological feasibility, estimating what is required to reduce the system to practice; and (4) financial feasibility, predicting the ability of the concepts to attract financial support. For each of these criteria, a set of terms or descriptors was identified, which should be used in the evaluation to render it complete. It is also demonstrated that these descriptors have the following properties: (a) their interpretation may be made by different groups of evaluators; (b) their interpretations and the way they are used may depend on the stage of development of the system in which they are used; (c) in formulating the problem, all descriptors should be addressed independent of the evaluation technique selected. FAA ACCEPTANCE TESTS ON THE NAVIGATION SYSTEM USING TIME GLOBAL POSITIONING SYSTEM Z SET RECEIVER Final Report, Jun. - Dec. 1979
Robert J. Esposito Jul. 1982 21 p refs
(FAA Proj. 049-330-110)
(DOT/FAA/RD-82/9) Avail: NTIS HC A02/MF A01

Acceptance tests on the Navigation System Using Time and Ranging (NAVSTAR) Global Positioning System (GPS) Z-set receiver are described. The Yuma laser tracking system computed a reference trajectory against which the GPS receiver solution was compared. Data from five flights, totaling over 6 hours, are presented with the objective of assessing Z-set capabilities to meet civil aviation requirements for nonprecision approaches. Author

OPERATIONAL AND FUNCTIONAL REQUIREMENTS FOR THE NAVIGATION SYSTEM IN TERMINAL AREAS Final Report
Satish C. Mohleji Feb. 1982 63 p refs
(Contract DOTA01-82-C-10003)
(AD-A116127; MTR-82W13; FAA-RD-82-10) Avail: NTIS HC A04/MF A01 CSCL 17/7

A comprehensive set of operational requirements relating the capabilities of the navigation system and its use in the ATC environment are developed in this paper by modifying the operational requirements for MLS established by the International Civil Aviation Organization. In order to establish the functional requirements, an interrelationship is established between the navigation system parameters, route geometry and ATC procedures considering system uncertainties. An impact of each ATC uncertainty (navigation, surveillance, communication delays, airspeeds and winds) is first examined individually by computing the time dispersions between the planned vs. the achieved aircraft performance. Then a total dispersion and control interaction is established by calculating the time variability due to speed adjustments permitted under ATC procedures, and by statistically combining the impact of the ATC uncertainties using a root sum square (RSS) approach. This technique is general enough to permit evaluation of functional requirements (accuracy, coverage and channel capacity) of any navigation system under varying ATC parameters, procedures and operational requirements. ANALYSIS OF ACTIVE BCAS ALERT RATES AND PROTECTION BASED ON ACTUAL AIRCRAFT TRACKS Final Report
Lillian B. Zarrelli Feb. 1982 239 p refs
(Contract DTFA01-82-C-10003)
(AD-A116402; MTR-80W267; FAA-RD-82-33) Avail: NTIS HC A11/MF A01 CSCL 17/7

This document describes an evaluation of the performance of the Active Beacon Collision Avoidance System (Active BCAS) using the Houston data base and simulated midair collision scenarios. The Houston data was extracted from ARTS III tapes and consisted of 65 hours of operation. This data was used to measure alert rates and assess desensitization techniques aimed at reducing the number of unnecessary alerts. The midair data base consisted of the reconstructed flight paths of 15 actual midair collisions. Measures of protection and tradeoffs were made based on the performance of the BCAS logic in resolving these simulated collision scenarios. Author (GRA)

EXPERIMENTAL INVESTIGATION OF ACTIVE LOADS CONTROL FOR AIRCRAFT LANDING GEAR
John R. McGehee and Robert C. Dreher Aug. 1982 72 p refs

(NASA-TP-2042; L-15224; NAS 1.60:2042) Avail: NTIS HC A04/MF A01 CSCL 01C

Aircraft dynamic loads and vibrations resulting from landing impact and from runway and taxiway unevenness are recognized as significant in causing fatigue damage, dynamic stress on the airframe, crew and passenger discomfort, and reduction of the pilot's ability to control the aircraft during ground operations. One potential method for improving operational characteristics of aircraft on the ground is the application of active control technology to the landing gears to reduce ground loads applied to the airframe. An experimental investigation was conducted which simulated the landing dynamics of a light airplane to determine the feasibility and potential of a series hydraulic active control main landing gear. The experiments involved a passive gear and an active control gear. Results of this investigation show that a series hydraulically controlled gear is feasible and that such a gear is very effective in reducing the loads transmitted by the gear to the airframe during ground operations. AN EFFECTIVE ALGORITHM FOR SHOCK-FREE WING DESIGN

K.-Y. Fung, A. Robert Seebass, L. J. Dickson, and C. F. Pearson Jun. 1981 31 p refs Presented at the 14th AIAA Fluid and Plasma Dyn. Conf., Palo Alto, Calif., 23-25 Jun. 1981

(Contract N00014-76-C-0182)

(AD-A116265; TFD-81-06) Avail: NTIS HC A03/MF A01 CSCL 20/4

This paper reviews the fictitious gas procedure of Sobieczky for finding shockfree airfoils and wings. Results for inviscid and viscous flows for airfoils and wings are described. The method is applied to a business jet planform resulting in a wing that should have good low speed characteristics as well as an M-infinity L/D that is near the maximum achievable for the wing lift and thickness chosen for the study. THE MANEUVERABLE ATMOSPHERIC PROBE (MAP), A REMOTELY PILOTED VEHICLE Final Report

Roberto Rubio, Claude L. Tate, Maynard L. Hill, Harold N. Ballard, Mike Izquierdo, and Carlos McDonald May 1982 56 p refs

(DA Proj. 1L1-62111-AH-71)

(AD-A116118; ERADCOM/ASL-TR-0110) Avail: NTIS HC A04/MF A01 CSCL 01/3

This report documents, in considerable detail, the physical and aerodynamic characteristics of the 10-hp, 36.5-kg, radio-controlled MAP aircraft, as well as the novel fluidic and electrostatic vertical stabilizer systems assisting in aircraft control. The atmospheric and aerodynamic sensor configurations, including the sensor data telemetry system, are described. Three distinct flight experiments were conducted with the instrumented MAP vehicle. During the first experiment, dust particulate samples, raging in size from 0.2 micrometer to 400 micrometer, were obtained by flying the RPV-mounted samplers through low altitude dust clouds generated by ground-based 105-mm artillery shell explosions. Data from this experiment are presented. The second experiment involved characterizing typical atmospheric conditions along a laser propagation range (path). Graphs of atmospheric temperature, pressure, RH, and derived air density, all as functions of RPV altitude, present data that are representative of those obtained from the second experiment. Measurement accuracies for temperature, pressure, and RH are respectively shown to be plus or minus 1 deg C, plus or minus 2 percent of the total pressure and plus or minus 4 percent of actual RH. The third experiment was conducted with the instrumented RPV being flown near a mountain peak whose altitude is 2440 millimeter relative to mean sea level (msl). Atmospheric electric field intensity and turbulence structure measurements as functions of RPV position relative to the mountain peak make up the third set of data presented in this report. GRA

SIMULATION OF THE INTERACTION BETWEEN AIRDROP PLATFORMS AND AIRCRAFT ROLLERS

Earl C. Steeves Apr. 1982 54 p

(DA Proj. 1L1-62210-D-283)

(AD-A116370; NATICK/TR-82/014) Avail: NTIS HC A04/MF A01 CSCL 01/2

All airdrop loads must be certified as not exceeding the maximum aircraft roller loads. This certification is presently accomplished by a series of tests which are numerous and complex. This report looks at the possibility of replacing this test procedure with a numerical simulation. Two simulations are examined; a straightforward deterministic structural simulation and a structural simulation that includes the imperfections in the system in a statistical manner. The imperfections in the system are large enough to make the deterministic structural model inadequate, and insufficient data are available to make an accurate statistical model of the imperfections. As a result, it was not possible to develop a complete model to carry out the roller load simulation, although only the imperfection model is needed for completion of the statistical simulation. The statistical model was used to demonstrate that the use of very flexible rollers would reduce the importance of the imperfections in the system. GRA

A METHOD FOR DESIGNING INLET DISTORTION SCREENS FOR AIRCRAFT GAS TURBINE ENGINE TESTS USING AN INTERACTIVE COMPUTER PROGRAM Final Report

Robert E. Anderson May 1982 35 p ref

(AD-A116584; NAPC-PE-66) Avail: NTIS HC A03/MF A01 CSCL 21/5

The design of inlet distortion screens used for testing aircraft gas turbine engines can be facilitated by using an interactive computer program. This report describes a computer program which has been developed by the Naval Air Propulsion Center to aid in the screen design process. The computer program can be used to establish the initial screen design and to develop modifications after the screen is tested. Author (GRA)

FUNCTIONAL DESIGN TO SUPPORT CDTI/DABS FLIGHT EXPERIMENTS Final Report

Tsuyoshi Goka Jul. 1982 170 p refs

(Contract NAS1-16802)

(NASA-CR-165947; NAS 1.26:165947) Avail: NTIS HC A08/MF A01 CSCL 01D

The objectives of this project are to: (1) provide a generalized functional design of CDTI avionics using the FAA developed DABS/ATARS ground system as the 'traffic sensor', (2) specify software modifications and/or additions to the existing DABS/ATARS ground system to support CDTI avionics, (3) assess the existing avionics of a NASA research aircraft in terms of CDTI applications, and (4) apply the generalized functional design to provide research flight experiment capability. DABS Data Link Formats are first specified for CDTI flight experiments. The set of CDTI/DABS Format specifications becomes a vehicle to coordinate the CDTI avionics and ground system designs, and hence, to develop overall system requirements. The report is the first iteration of a system design and development effort to support eventual CDTI flight test experiments. Author

Computer outages at air terminal facilities and their correlation to near miss mid-air collisions (AFMD-82-43) [B-206064] N82-28264

SYSTEM IDENTIFICATION
Parameter estimation applied to general aviation aircraft - A case study [AIAA PAPER 82-1313] A82-39094

SYSTEMS ANALYSIS
System identification of nonlinear aerodynamic models N82-29996

SYSTEMS COMPATIBILITY
Target acquisition system/air-to-surface weapon compatibility analysis [AIAA 82-1618] A82-38995
Inlet and airframe compatibility for a V/STOL fighter/attack aircraft with top-mounted inlets A82-40908

SYSTEMS ENGINEERING
A design criterion for highly augmented fly-by-wire aircraft [AIAA 82-1570] A82-38969
The use of differential pressure feedback in an automatic flight control system [AIAA 82-1596] A82-38981
Avoiding the pitfalls in automatic landing control system design [AIAA 82-1599] A82-39013
Application of multivariable model following method to flight controller [AIAA PAPER 82-1349] A82-39120
A practical approach to the incorporation of technical advances in avionics A82-40886
Design and experience with a low-cost digital fly-by-wire system in the SAAB JA37 Viggen A/C A82-40905
Design of a longitudinal ride-control system by Zakian's method of inequalities A82-41114
Hydraulic Universal Display Processor System (HUDPS) [AD-A114428] N82-28294

SYSTEMS INTEGRATION
VHF radio link for ground-air-ground communications using an integrated voice-data modulation A82-38405
A preliminary laboratory evaluation of a reconfigurable integrated flight control concept [AIAA 82-1597] A82-38982
Conceptual design of the LHX integrated cockpit A82-40827
Avionics systems for helicopter integration A82-40554
Advanced fighter technology integration program AFTI/F-16 A82-40906
Preliminary design of an advanced integrated power and avionics information system A82-40907
Multifunction multiband airborne radio architecture study [AD-A114427] N82-28523
Problems related to the integration of fault tolerant aircraft electronic systems [NASA-CR-165926] N82-29022
Windtunnel capability related to test sections, cryogenics, and computer-windtunnel integration [AGARD-AR-174] N82-29334

SYSTEMS MANAGEMENT
Special investigation report: Air traffic control system [PB82-136276] N82-28277

SYSTEMS SIMULATION
Problems in the simulation of correlation-extremal navigation systems A82-39403
Sensor stabilisation requirements of RPV's - A simulation study A82-39761

T

T-2 AIRCRAFT
Developments on graphite/epoxy T-2 nose landing gear door A82-39893
Design, fabrication and qualification of the T-2 composite rudder A82-39894

T-37 AIRCRAFT
USAF bioenvironmental noise data handbook. Volume 148. T-37B in-flight crew noise [AD-A114943] N82-30031

T-56 ENGINE
Results of T56 engine performance monitoring trial in Hercules aircraft, February - July 1977 [ARL-MECH-ENG-TECH-MEMO-409] N82-29322

TABLES (DATA)
Flight attendant injuries: 1971-1976 [AD-A114909] N82-29274

TAIL ASSEMBLIES
Tail versus canard configuration - An aerodynamic comparison with regard to the suitability for future tactical combat aircraft A82-40901
Experimental and theoretical studies of three-dimensional turbulent boundary layers on an empennage of a typical transport airplane A82-40955
Research model wing/tail fabrication --- transonic wind tunnel 1/7.5-scale model [AD-A114101] N82-28286

TAKEOFF
Alert aircraft roll over chocks [AD-A107456] N82-28307
The cost of noise reduction for departure and arrival operations of commercial tilt rotor aircraft [NASA-CR-137803] N82-29316

TANDEM ROTOR HELICOPTERS
Tandem rotor helicopter characteristics in a continuous icing environment A82-40523

TARGET ACQUISITION
Target acquisition system/air-to-surface weapon compatibility analysis [AIAA 82-1618] A82-38995
Algorithm development for infra-red air-to-air guidance systems A82-39151
Target tracking using area correlation A82-39194
U.S. Army remotely piloted vehicle program A82-39782

TARGET RECOGNITION
Target acquisition system/air-to-surface weapon compatibility analysis
[AIAA 82-1618] A82-38985
Moving target detector (Mod 2)
[AD-A114709] N82-29520
TASKS
Jobs and tasks in air traffic control N82-29298
TAXIING
Alert aircraft roll over chocks
[AD-A107456] N82-28307
TECHNOLOGICAL FORECASTING
Future terminal area systems A82-38462
Future helicopter cockpit design A82-40529
Engine controls for the 1980s and 1990s A82-40986
Advanced casting: Today and tomorrow --- aerospace industry components casting N82-28406
TECHNOLOGY ASSESSMENT
Canadair rotary wing technology development A82-39731
On the state of technology and trends in composite materials in the United States A82-39882
Touchdown technology --- large aircraft landing gear stress A82-40057
Civil helicopter propulsion system reliability and engine monitoring technology assessments A82-40518
Support of the HH-65A - The impact of advanced technology of VTOL systems upon existing product support A82-40541
Recent advances in the performance of high bypass ratio fans A82-40891
Advanced technologies applied to reduce the operating costs of small commuter transport aircraft A82-40915
Assessment of advanced technologies for high performance single-engine business airplanes A82-40932
Turboprop design - Now and the future A82-40965
New technology for the next generation of commercial transports - Real or imaginary A82-41007
Cost analysis of the Discrete Address Beacon System for the low-performance general aviation aircraft community
[AD-A112957] N82-28274
TECHNOLOGY TRANSFER
Optimizing aerospace structures for manufacturing cost A82-41016
TECHNOLOGY UTILIZATION
The need for a dedicated public service helicopter design A82-38422
The technological aspects of titanium application in the TU-144 aircraft structure A82-39718
On the state of technology and trends in composite materials in the United States A82-39882
800 Shaft Horsepower Advanced Technology Demonstrator Engine A82-40520
Advanced technologies applied to reduce the operating costs of small commuter transport aircraft A82-40915
Nondestructive testing in aircraft construction using holographic methods A82-40977
TELECOMMUNICATION
Communications N82-29302
TELEVISION CAMERAS
The design of a viewing system for near real time stereo images from a CCD large linear sensor --- Unmanned Aircraft A82-39746
TELEVISION SYSTEMS
Sensor stabilization requirements of RPVs - A simulation study A82-39761
TEMPERATURE EFFECTS
Evaluation of heat damage to aluminum aircraft structures A82-41001
TEMPERATURE MEASUREMENT
The use of analog computers in solutions of inverse problems of heat conduction for the identification of boundary conditions on the surfaces of gas-turbine-engine parts on the basis of temperature-measurement results A82-39467
TERMINAL FACILITIES
Future terminal area systems A82-38462
TERMINAL GUIDANCE
Algorithm development for infra-red air-to-air guidance systems A82-39191
Terminal information display system benefits and costs
[AD-A110937] N82-28291
TERRAIN ANALYSIS
A recursive terrain height correlation system using multiple model estimation techniques
[AIAA 82-1513] A82-38887
TERRAIN FOLLOWING AIRCRAFT
Simulator investigations of various side-stick controller/stability and control augmentation systems for helicopter terrain flight
[AIAA 82-1522] A82-38848
A terrain following system, an algorithm and a sensor A82-39700
Terrain following/terrain avoidance system concept development
[AIAA PAPER 82-1518] A82-40420
TEST STANDS
Analyzing stable pad disturbances and design of a sensor vault to monitor pad stability
[AIAA 82-1565] A82-39011
TF-34 ENGINES
TF34 Convertible Engine System Technology Program A82-40521
THEMATIC MAPPING
Scanner imaging systems, aircraft A82-38715
THERMAL EXPANSION
Evaluation of an asymptotic method for helicopter rotor airloads A82-40509
THERMOPLASTIC RESINS
Heat release rate calorimetry of engineering plastics A82-41075
THERMOVISCOELASTICITY
Recent development in hygrothermoviscoelastic analysis of composites A82-39676
THIN PLATES
In-plane shear test of thin panels A82-40985
THIN WALLS
The behavior of composite thin-walled structures in dynamic buckling under impact A82-40976
THIN WINGS
The unsteady motion of a wing traveling at subsonic speed above a plane A82-39336
On embedded flow characteristics of sharp edged rectangular wings
[LGB-C4712] N82-29301
THREE DIMENSIONAL BOUNDARY LAYER
Experimental and theoretical studies of three-dimensional turbulent boundary layers on an empennage of a typical transport airplane A82-[illegible]
THREE DIMENSIONAL FLOW
Comparison of experimental and analytic performance for contoured endwall nozzles
[AIAA PAPER 82-1286] A82-[illegible]
Computation of supersonic flow around three-dimensional wings A82-[illegible]

ERKELENS, L. J. J.

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal*, vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. A82-41686 # The analysis of the thermal-mechanical stress conditions in axisymmetric rotating hot components of /aircraft/ gas turbines (Zur Analyse des thermisch-mechanischen Spannungszustandes in rotationssymmetrischen drehenden Heissteilen von /Flug-/ Gasturbinen). D. Keppeler. München, Technische Universität, Fakultät für Maschinenwesen, Dr.-Ing. Dissertation, 1980. 183 p. 85 refs. In German.

The essential equations for computations concerning axial turbine disks are presented, taking into account steady and unsteady heat transfer, linear-elastic calculations, elastoplastic calculations, and thermal, aerodynamic, and mechanical boundary conditions. Two different numerical methods are described. One is used to obtain numerical values regarding the aerodynamic-thermal boundary conditions at the hub and on the surfaces. The second procedure considered is the method of finite elements. This method provides a good approximation regarding the solution of the considered problems even in the case of axial turbine disks of complex shape. The suitability of the developed programs for the solution of the considered problems is demonstrated with the aid of comprehensive computational examples. The elastoplastic calculation discussed represents a first important step towards the computation of the operational life of hot gas turbine components which are subjected to great thermal-mechanical stresses. G.R.

A82-41687 # A restrained model helicopter, which is able to fly, for investigations regarding human multiparameter control behavior (Ein flugfähig eingespannter Modellhubschrauber für Untersuchungen zum menschlichen Mehrgröessenreglerverhalten). W. H. Oesterlin. Darmstadt, Technische Hochschule, Fachbereich Regelungs- und Datentechnik, Dr.-Ing. Dissertation, 1980. 259 p. 77 refs. In German. Research supported by the Deutsche Forschungsgemeinschaften.

The control of a Remotely Piloted Vehicle (RPV) with six degrees of freedom of motion represents for the human operator a very difficult problem. The present investigation is concerned with this problem. The conducted studies involve the control of the hovering flight of a remotely piloted model helicopter. A 'model helicopter trainer' was employed in place of a model engaged in free flight. By means of a special mechanism, the helicopter is connected to a carriage which is mounted on two rails. The constructional design involved permits helicopter hovering flight operations. The conduction of investigations regarding the control behavior of man requires that the dynamic behavior of the controlled system is known. A model for the operational characteristics of the helicopter in hovering flight was, therefore, developed. The model provided the basis for the development of a dynamic multiparameter control model for two experienced pilots. G.R.

A82-41700 Characteristics of a Paris-New York flight on board the Concorde (Réalisation d'un vol Paris-New York sur Concorde). F. Vicens (Compagnie Nationale Air France, Paris, France). *Navigation* (Paris), vol. 30, July 1982, p. 310-328. In French.

A summary of crew operating procedures in-flight on board the Concorde during a trip from Paris to New York is presented. Details of checklist sequences are reviewed, including adjustment of the center of gravity through fuel pumping, noise suppression steps, climb through the transonic regime, and use of afterburners for supersonic cruise. The inertial navigation system is activated once cruise speed is reached at Mach 2 and over 50,000 ft altitude, and maintains control for the Atlantic crossing. The landing phase is guided either by a VOR/DME designated Hyannis-Long Island, or by means of a VOR situated 119 nmi along a 142 deg radial vector from New York. Using the second beacon is noted to allow approximately six more miles in a supersonic regime. M.S.K.

A82-41725 Oxidation-resistant materials for hot-gas turbines and jet engines. I (Über oxidationsbeständige Werkstoffe für Heissgasturbinen und Strahltriebwerke. I). K. Hauffe. *Metall,* vol. 36, Aug. 1982, p. 882-888. In German.

High-alloy chromium and chromium-nickel steels are very suitable for a use as construction material in gas turbines operating at high temperatures and in jet engines. Nickel-chromium alloys containing aluminum are superior to cobalt-chromium alloys with respect to corrosion resistance. It is pointed out that the presence of halides and sulfur compounds in the combustion gases makes it necessary to utilize special approaches in order to keep the corrosion of expensive alloys, even at high temperatures, within acceptable limits. These approaches involve the development of oxidation-resistant materials which can provide a protective coating for the basic alloy. Possibilities are discussed for improving the inherent corrosion resistance of pure nickel with the aid of suitable alloying ingredients. G.R.

A82-41795 Simulated ILS using a laser tracker. L. H. Morinaga (Douglas Aircraft Co., Long Beach, CA). In: International Instrumentation Symposium, 27th, Indianapolis, IN, April 27-30, 1981, Proceedings. Part 1. Research Triangle Park, NC, Instrument Society of America, 1981, p. 347-355.

The Simulated ILS (Instrument Landing System) was developed to test and evaluate an aircraft's Autopilot modes, particularly autoland and ground rollout. This system utilizes a laser tracker to obtain continuous space position data of the test aircraft. A minicomputer software program determines the aircraft position relative to the test runway. Aircraft deviation from the center of a simulated ILS beam is calculated on the ground, telemetered to the test aircraft, and input to the airborne flight guidance system. Since beam simulation is accomplished in software, almost any type of desired simulation is possible. By the simulation of numerous actual airport ILS beams at a single test site, significant cost savings in flight time and fuel are realized. This system is currently in use on a major commercial aircraft flight-test program. (Author)

A82-41796 Analysis of flight data in the frequency domain. W. R. Wells (Wright State University, Dayton, OH) and S. S. Banda (Dayton, University, Dayton, OH). In: International Instrumentation Symposium, 27th, Indianapolis, IN, April 27-30, 1981, Proceedings. Part 1. Research Triangle Park, NC, Instrument Society of America, 1981, p. 357-365. 9 refs.

This paper describes the methods commonly used to process flight data in the frequency domain for application to aircraft parameter estimation. Estimates of stability and control derivatives were obtained by the use of maximum likelihood estimation methods in the frequency domain. The case used for illustration purposes is flight data from a single engine general aviation airplane. The airplane equations of motion included unsteady aerodynamics. The airplane responses were generated by using rudder and aileron deflections. Measured data is converted by a Fast Fourier Transform algorithm into the frequency domain. An interpolation technique such as 'zero packing' is demonstrated for the purpose of increasing the frequency sampling rate for the estimation algorithm. It was shown that the use of zero packing technique will improve the estimates of stability and control derivatives. (Author)

A82-41846 * Programmable controller system for wind tunnel diversion vanes. R. F. King (NASA, Ames Research Center, Moffett Field, CA). In: International Instrumentation Symposium, 28th, Las Vegas, NV, May 3-6, 1982, Proceedings. Part 1. Research Triangle Park, NC, Instrument Society of America, 1982, p. 457-463.

A programmable controller (PC) system automatic sequence control, which acts as a supervisory controller for the servos, selects the proper drives, and automatically sequences the vanes, was developed for use in a subsonic wind tunnel. Tunnel modifications include a new second test section (80 ft x 100 ft with a maximum air speed capability of 110 knots) and an increase in maximum velocity flow from 200 knots to 300 knots. A completely automatic sequence control is necessary in order to allow intricate motion of the 14 triangularly arranged vanes which can be as large as 70 ft high x 35 ft wide and which require precise acceleration and deceleration control. Rate servos on each drive aid in this control, and servo cost was minimized by using four silicon controlled rectifier controllers to control the 20 dc drives. The PC has a programming capacity which facilitated the implementation of extensive logic design. A series of diagrams sequencing the vanes and a block diagram of the system are included. R.K.R.

A82-41854 * A miniature electro-optical air flow sensor. D. D. Kershner (NASA, Langley Research Center, Cockpit Systems Branch, Hampton, VA). In: International Instrumentation Symposium, 28th, Las Vegas, NV, May 3-6, about one-half of their heads immersed, speeding hypothermia. Life vests designed for easy donning with improved buoyancy and hypothermia protection should be employed. Slide/rafts, like those already installed in wide-body aircraft, should be developed for narrow-body aircraft, and airports should develop emergency plans for water accidents. A.B.

A82-44293 **Problems with the use of percentages in the analysis of AAES data.** J. E. Vetter (U.S. Navy, Washington, DC). *SAFE Journal*, vol. 12, Fall 1982, p. 23-26, 28, 29.

Techniques for rectifying common problems with the statistical analysis of in-service usage data for aircrew automated escape systems are outlined and illustrated. The comparison of percentage data should be made with regard to the sample size and its variation. Percentage points can be plotted along with a bar representing the confidence level. Trend-line analysis should use the method of weighted least squares, when some points have a larger variance than others. Pie charts can make a decrease in one component appear as an increase in another unless sample size is included. Log-linear model analysis is recommended for the analysis of categorical data. A.B.

A82-44467 # **Mediating Mach's mechanics - Bombs away.** D. Spurgeon. *Science Dimension*, vol. 14, no. 4, 1982, p. 10, 12, 14.

The Canadian National Aeronautical Establishment's (NAE) approach to the problems posed when cargo is carried externally at the speed of sound is presented. At such speed flutter can occur, leading to the break-up of the vehicle. In addition, stores released at transonic speeds may rise after a short fall as the aircraft moves ahead, and eventually collide with the tail section. Wind tunnel experiments have been carried out using force-measuring devices to determine the results of simulated flying conditions. These results can be scaled up to approximate real conditions, and may reduce the number of flight tests needed, while increasing the safety of actual tests. By flying a loaded aircraft equipped with accelerometers in the wing tips, it is found that a precise velocity must not be exceeded in order to avoid flutter. Weight, type, and suspension of the stores carried can influence this velocity. Research on this problem has significant applications in the production of civilian aircraft. R.K.R.

A82-44468 **XV-15 program update.** T. Thomason (Bell Helicopter Textron, Tilt Rotor Aircraft Dept., Fort Worth, TX). *Vertiflite*, vol. 28, Sept.-Oct. 1982, p. 12-15.

After nearly 500 hours of total operating time, the operating characteristics of the Army/NASA XV-15 Tiltrotor aircraft are becoming clear. Level flight at 301 knots, and descent at 345 knots have been demonstrated, as well as operation at 24,500 feet and between -0.5 and +2.7 G's; more than 100 full conversions have been made from the helicopter to the airplane mode and back. In addition, the aeroelastic stability of the wing/pylon/rotor system, gust sensitivity and the effects of disk loading and tipspeed on downwash, noise and hover mode operations have been investigated, and do not limit the aircraft's capability, although further modifications are planned. The Joint Services Advanced Vertical Lift Aircraft Development Program has been initiated partly as a result of the demonstration of the Tiltrotor concept. A.B.

A82-44469 **It's too logical - It'll never work /Commercial applications of the JVX/.** J. F. Zugschwert. *Vertiflite*, vol. 28, Sept.-Oct. 1982, p. 24-27.

It is proposed that both military and commercial applications of V/STOL aircraft be developed by the Joint Services Advanced Vertical Lift Aircraft Fleet, the commercial models would be subject to, and suitable for wartime call-up. Such cross utilization would have the benefit of spreading the R & D and acquisition costs over a larger base, and of reducing the total operational flying hour cost by permitting a return on investment from the commercial aircraft. This proposal is also deemed appropriate for the Heavy Lift Helicopter and the Advancing Blade Concept aircraft. A.B.

A82-44470 **Helicopter commuters - An optimistic outlook.** L. K. Smith. *Vertiflite*, vol. 28, Sept.-Oct. 1982, p. 28-32.

Current operations of helicopter airline services in the United States are reviewed along with past attempts at providing such a service. Problems which plagued helicopter services in the past included: the high number of maintenance hours per flight hour, high seat mile costs, percentages of on-time departures, labor-managment problems, and the need for city center heliports. Technological advances have reduced maintenance time as well as reducing noise and vibration, and improving avionics and crashworthiness; it is expected that seat mile costs will also be made more competitive with those of fixed wing aircraft. The recent start of helicopter shuttle operations by major airlines for their first-class and business-class passengers has reinforced the conviction that there is a need for helicopter commuter services. A.B.

A82-44480 * # **Minimum fuel horizontal flight paths in the terminal area.** E. Kreindler and F. Neuman (NASA, Ames Research Center, Moffett Field, CA). *Journal of Guidance, Control, and Dynamics*, vol. 5, Sept.-Oct. 1982, p. 490-497. 16 refs.

A82-44481 # **Maximum likelihood failure detection of aircraft flight control sensors.** B. Friedland (Singer Co., Kearfott Div., Little Falls, NJ). *Journal of Guidance, Control, and Dynamics*, vol. 5, Sept.-Oct. 1982, p. 498-503. 11 refs.

A recently developed maximum likelihood failure detection algorithm, based on processing the residuals from an observer designed on the assumption of no failures, is applied to the problem of detecting and correcting gyro or accelerometer failures in the vertical axis of an aircraft flight control system. Design calculations are illustrated with a simplified dynamic model and the effectiveness of the failure detection method is demonstrated by simulation. (Author)

A82-44482 # **Minimum-time three-dimensional turn to a point of supersonic aircraft.** C.-F. Lin (Wisconsin, University, Madison, WI). *Journal of Guidance, Control, and Dynamics*, vol. 5, Sept.-Oct. 1982, p. 512-520. 13 refs.

The objective of this paper is to present real-time, on-line, minimum-time three-dimensional turn to a point of supersonic aircraft. The analytic aspect of the theory of optimal trajectories is emphasized. This includes the general properties of optimal trajectories consisting of the integrals of motion and the characteristic features in engine and aerodynamic controls. By using the integrals of motion the totality of the optimal trajectories can be obtained as a family of curves depending on a certain number of arbitrary constants. The optimal control is obtained by geometrical method through the domain of maneuverability. This makes explicit the switching characteristics of the optimal control, in particular when singular or chattering control is involved. The optimality of singular thrust control and the optimal junction of different subarcs are analyzed. The computation of the optimal trajectories is carried out using the aerodynamic and engine characteristics of a lightweight, high thrust-to-weight ratio supersonic fighter. By using normalized control variables, i.e., the thrust-to-weight ratio, the bank angle, and the load factor, results can be applied to any supersonic aircraft. (Author)

A82-44695 # **Design to life cycle cost capability of the PRICE models.** M. H. Burmeister (RCA, Cherry Hill, NJ). *International Astronautical Federation, International Astronautical Congress, 33rd, Paris, France, Sept. 27-Oct. 2, 1982, Paper 82-221.* 8 p.

PRICE is a family of three parametric cost predicting models, currently widely used in U.S. government and industrial circles. A number of European organizations also use the PRICE models. A case study, utilizing the PRICE Hardware and Life Cycle models, is presented here to illustrate the cost impact of maintainability considerations for Avionic equipment. The study depicts a trade-off analysis to assess the economic impact of designing equipment with two different technologies for changing deployment scenarios. This case study is not intended to provide a definitive answer on the level of technology to be employed in the design of avionics. Rather, the purpose of this analysis is to illustrate the flexibility and utility of parametric estimating models. Through the use of these parametric models, a practical method now exists to conduct multiple, rapid, design-to-life-cycle-cost trade-off analyses. (Author)

A82-44699 # **Consideration of an international private sector satellite search and rescue locating system.** C. M. Case (Boeing Aerospace Co., Seattle, WA). *International Astronautical Federation, International Astronautical Congress, 33rd, Paris, France, Sept. 27-Oct. 2, 1982, Paper 82-236.* 11 p. 24 refs.

This paper presents a rationale for the creation of a private sector organization to establish, finance, and operate an international satellite aided search and rescue locating system. The social and political impact of such a system on the global community is examined. Organizational structure, ownership, and control design issues are considered using Intelsat and Inmarsat as models. Questions of financial support including source and stability of income streams are addressed. Search and rescue requirements and satellite design trades are considered, and a conceptual network design is described. (Author)

The DFLR-F4 wing-body combination is studied. The 1/38 model is formed by a 9.5 aspect ratio transonic wing and an Airbus A 310 fuselage. The F4 wing geometrical characteristics are described and the main experimental results obtained in the S2MA wind tunnel are discussed. Both wing-fuselage interferences and viscous effects, which are important on the wing due to a high rear loading, are investigated by performing 3D calculations. An attempt is made to find their limitations. S.L.

Jet noise on underexpanded supersonic jets are studied with emphasis on determining the role played by large scale organized flow fluctuations in the flow and acoustic processes. The experimental conditions of the study were chosen as low Reynolds number (Re = 8,000) Mach 1.4 and 2.1, and moderate Reynolds number (Re = 68,000) Mach 1.6 underexpanded supersonic jets exhausting from convergent nozzles. At these chosen conditions, detailed experimental measurements were performed to improve the understanding of the flow and acoustic properties of underexpanded supersonic jets. S.L.

AEROPROPULSIVE CHARACTERISTICS OF MACH NUMBERS UP TO 2.2 OF AXISYMMETRIC AND NON-AXISYMMETRIC NOZZLES INSTALLED ON AN F-18 MODEL
Francis J. Capone Aug. 1982 80 p refs
(NASA-TP-2044; L-15208; NAS 1.60:2044) Avail: NTIS HC A05/MF A01 CSCL 01A

An investigation to determine the aeropropulsive characteristics of nonaxisymmetric nozzles on an F-18 jet effects model was conducted in the Langley 16-foot transonic tunnel and the AEDC 16-foot supersonic wind tunnel. The performance of a two dimensional convergent-divergent nozzle, a single expansion ramp nozzle, and a wedge nozzle was compared with that of the baseline axisymmetric nozzle. Test data were obtained at static conditions and at Mach numbers from 0.60 to 2.20 at an angle of attack of 0 deg. Nozzle pressure ratio was varied from jet-off to about 20. Author

EFFECTS OF CANOPY GEOMETRY AND CLOTH PERMEABILITY ON THE DRAG COEFFICIENT OF A CROSS PARACHUTE IN THE FULLY OPEN AND REEFED CONDITIONS FOR A W/A RATIO OF 0.3 Final Report, FY 1981
W. P. Ludtke 1 Feb. 1982 77 p
(AD-A115046; AD-F500030; NSWC/TR-81-441) Avail: NTIS HC A05/MF A01 CSCL 01/3

This report describes a series of wind-tunnel tests on the cross-type parachute to investigate the effects of cloth permeability, number of suspension lines, and suspension line length in the fully opened and reefed conditions. Forty-inch-diameter models with a canopy arm width-to-length ratio (W/L) of 0.3 were tested at various velocities from 50 fps to 293 fps in the fully inflated state. Results of these tests demonstrate that the parachute geometry and cloth permeability do have an effect on the drag capability of the cross parachute. Additional tests of reefed configurations for several reefing line lengths-to-canopy-diameter ratios from 0.6 to 1.6 at a constant velocity of 203 fps established the reefed characteristics of this parachute. The steady state forces in the reefing line were measured by use of strain gage links. Data are presented in tabular and graphical format. Photographs of representative canopy shapes are included for illustration. GRA

WIND TUNNEL INVESTIGATIONS ON THIN SUPERCRITICAL AIRFOILS IN HIGH SUBSONIC FLOW
Horst Koerner and Wolfgang Puffert-Meissner Feb. 1982 63 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-774)
(DFVLR-FB-82-06; ESA-TT-774) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 19.30

Four thin airfoils (t/c = 0.05) were investigated experimentally. The aerodynamic efficiency of three supercritical airfoils is compared with that of a conventional one. The investigation was conducted in a transonic wind tunnel within a Mach number

Head-Up Display (HUD) system; (2) Air-to-air lead angle computation for the HUD air-to-air gunsight; (3) Air-to-ground weapon depression and across-wind aimpoint computation for the HUD air-to-ground Continuously Computed Impact Point (CCIP) weapon release cue; and (4) Breakway warning computation for terrain and weapon fragmentation avoidance for the HUD air-to-ground CCIP mode. DEVELOPMENT OF A SPINNING WAVE HEAT ENGINE Final Report

B. T. Zinn, E. A. Powell, and J. E. Hubbartt Aug. 1982 100 p refs

(Grant NAG3-96)

(NASA-CR-165611; NAS 1.26:165611) Avail: NTIS HC A05/MF A01 CSCL 21E

A theoretical analysis and an experimental investigation were conducted to assess the feasibility of developing a spinning wave heat engine. Such as engine would utilize a large amplitude traveling acoustic wave rotating around a cylindrical chamber, and it should not suffer from the inefficiency, noise, and intermittent thrust which characterizes pulse jet engines. The objective of this investigation was to determine whether an artificially driven large amplitude spinning transverse wave could induce a steady flow of air through the combustion chamber under cold flow conditions. In the theoretical analysis the Maslen and Moore perturbation technique was extended to study flat cylinders (pancake geometry) with completely open side walls and a central opening. In the parallel experimental study, a test moel was used to determine resonant frequencies and radial pressure distributions, as well as oscillatory and steady flow velocities at the inner and outer peripheries. The experimental frequency was nearly the same as the theoretical acoustic value for a model of the same outer diameter but without a central hole. Although the theoretical analysis did not predict a steady velocity component, simultaneous measurements of hotwire and microphone responses have shown that the spinning wave pumps a mean flow radially outward through the cavity. SINGULAR PERTURBATION TECHNIQUES FOR REAL TIME AIRCRAFT TRAJECTORY OPTIMIZATION AND CONTROL Final Report, Feb. 1978 - Dec. 1981

Anthony J. Calise and Daniel D. Moerder NASA Washington Aug. 1982 111 p refs

(Grant NsG-1496)

(NASA-CR-3597; NAS 1.26:3597) Avail: NTIS HC A06/MF A01 CSCL 01C

The usefulness of singular perturbation methods for developing real time computer algorithms to control and optimize aircraft flight trajectories is examined. A minimum time intercept problem using F-8 aerodynamic and propulsion data is used as a baseline. This provides a framework within which issues relating to problem formulation, solution methodology and real time implementation are examined. Theoretical questions relating to separability of dynamics are addressed. With respect to implementation, situations leading to numerical singularities are identified, and procedures for dealing with them are outlined. Also, particular attention is given to identifying quantities that can be precomputed and stored, thus greatly reducing the on-board computational load. Numerical results are given to illustrate the minimum time algorithm, and the resulting flight paths. An estimate is given for execution time and storage requirements. Author

DESIGN OF ADVANCED DIGITAL FLIGHT CONTROL SYSTEMS VIA COMMAND GENERATOR TRACKER (CGT) SYNTHESIS METHODS, VOLUME 1 M.S. Thesis

Richard M. Floyd Dec. 1981 226 p refs 2 Vol.

(AD-A115510; AFIT/GE/EE/81-20-Vol-1) Avail: NTIS HC A11/MF A01 CSCL 01/2

This study develops a computer program for interactive execution to aid in the design of Command Generator Tracker control systems employing Proportional-plus-Integral inner-loop controllers and Kalman Filters for state estimation (CGT/PI/KF controllers). Design parameters are specified in the continuous-time domain and the computer program obtains the corresponding discrete-time parameters and determines a direct digital design for sampled-data implementation. Designs are based upon the Linear system mode, Quadratic cost, and Gaussian noise process (LQG) assumptions of optimal control theory. The report discusses the theoretical background and applications of optimal model-following designs which preceded the CGT theory. A development of the CGT/PI/KF controller theory is presented, and performance evaluation tools for the controller design are discussed. Following a brief description of the computer program developed, results of applying it to example aircraft-related controller design problems are presented and discussed. GRA

DESIGN OF ADVANCED DIGITAL FLIGHT CONTROL SYSTEMS VIA COMMAND GENERATOR TRACKER (CGT) SYNTHESIS METHODS, VOLUME 2 M.S. Thesis

Richard M. Floyd Dec. 1981 246 p refs 2 Vol.

(AD-A115511; AFIT/GE/EE/81-20-Vol-2) Avail: NTIS HC A11/MF A01 CSCL 01/2

CGTPIF is a controller design program which executes interactively. Three design paths are offered: (1) design of a Proportional-plus-Integral (PI) regulator via linear-quadratic (LQ) methodology; (2) design of a Command Generator Tracker, either open-loop (CGT) or closed-loop (CGT/PI); and (3) design of a Kalman filter (KF). These three designs are components of a final controller implemented as a Command Generator Tracker, with an inner-loop proportional-plus-integral regulator, and a Kalman filter for state estimation (CGT/PI/KF). For each design path there is a corresponding set of routines to evaluate the quality of the design achieved. The program is written in FORTRAN IV and consists of about 2500 lines of source code. In addition, numerous routines are employed from a library of matrix routines described in Reference 24. Author (GRA)

DESCRIPTION OF A SIMPLE MODEL TO DETERMINE LANDING GEAR FORCES DURING THE TAKEOFF OF AERODYNAMICALLY UNSTABLE AIRCRAFT [BESCHREIBUNG EINES EINFACHEN MODELLS ZUR ERMITTLUNG VON FAHRWERKSKRAEFTEN WAEHREND DES STARTVORGANGS EINES AERODYNAMISCHES INSTABILEN FLUGZEUGS]

M. Soelter 25 Nov. 1981 43 p refs In GERMAN

(EX-22B) Avail: NTIS HC A03/MF A01

A simple model to simulate the lateral motion during the takeoff of an aerodynamically unstable aircraft is presented. By neglecting the landing gear dynamics no additional solution of the corresponding differential equations was required. Landing gear forces were determined from the geometrical ratios of the aircraft to the ground reference line. This procedure is particularly efficient when no high frequency landing gear drive-as, e.g., during touchdown has to be taken into account. The objection free function of the control concept for an aircraft aerodynamically unstable in the lateral plane is shown. Author (ESA)

STUDY OF THE DE-ICING PROPERTIES OF THE ASDE-3 ROTODOME Final Report, Sep. 1978 - Sep. 1980

Merrill K. Goulding Washington FAA Apr. 1982 132 p refs

(Grant DOT-TSC-15950)

(AD-A115445; DOT/FAA/RD-81/112; DOT-TSC-FAA-81-24; DTS-541) Avail: NTIS HC A07/MF A01 CSCL 01/5

A study was conducted of the thermal characteristics of the

ASDE-3 system's rotating radome (rotodome), a spheri-toroidal thin wall structure, approximately 16 feet in diameter and 6 feet in height. The purpose of the study was to determine the thermal transmissivities of the various regions of the design, discover 'hot spots,' determine the need for insulation, heater exhaust deflectors and other enhancements, and to make a prediction of the ability of its heaters to prevent system outages due to ice accretion on the rotodome. An analysis made using test data to predict the ability of the rotodome to resist icing conditions was very encouraging, demonstrating that convection becomes the dominant mode of heat loss during high wind conditions. A conservative analysis was made with winds applied at full velocity across all regions of the rotodome. The results indicate that the goal of de-icing the rotodome appears achievable using 30 kW of power. Although there are hot spots about the rotodome, the de-icing function using the hot air blower system is satisfactory. To reduce hot spots near the blower assembly, a deflector is recommended at the output of the blower. Author (GRA)

CALIBRATION AND PERFORMANCE OF THE AEDC/VKF TUNNEL C, MACH NUMBER 4, AEROTHERMAL WIND TUNNEL Final Report, 15 May - 18 Dec. 1981
W. T. Strike, Jr. Jun. 1982 117 p refs
(AD-A116279; AEDC-TR-82-6) Avail: NTIS HC A06/MF A01 CSCL 14/2

The shakedown and calibrated characteristics of the new AEDC Mach Number 4 Aerothermal Wind Tunnel were experimentally identified at several test conditions. The nominal Mach number of the test core as defined by a 30-probe pitot pressure rake varied between nominally 3.95 and 4.0, depending on the test section Reynolds number and stilling chamber temperature. The overall variation in the stilling chamber pressure is nominally 15 to 180 psia, with temperatures from 250 to 1,210 F for an overall Reynolds number range of 0.2 to 8.1 million per foot and true temperature-pressure altitude simulation from 56,000 to 105,000 ft. KEVLAR/PMR-15 REDUCED DRAG DC-9 REVERSER STANG FAIRING
R. T. Kawai Aug. 1982 140 p refs
(Contract NAS3-21763)
(NASA-CR-165448; NAS 1.26:165448) Avail: NTIS HC A07/MF A01 CSCL 11D

A reduced drag fairing for the afterbody enclosing the thrust reverser actuators on the DC-9 has been developed with Kevlar-49/PMR-15 advanced composite material. The improved fairing reduces airplane drag 1% compared to the production baseline. Use of composites reduces weight 40% compared to an equivalent metal fairing. The Kevlar-49/PMR-15 advanced composite is an organic matrix material system that can be used at temperatures up to 500 F. Author

ENVIRONMENTAL AND HIGH-STRAIN RATE EFFECTS ON COMPOSITES FOR ENGINE APPLICATIONS
C. C. Chamis and G. T. Smith 1982 20 p refs Presented at the 23rd Struct. Dyn. and Mater. Conf., New Orleans, 10-12 May 1982; sponsored by AIAA, ASME, ASCE, and AHS Previously announced in IAA as A82-30110
(NASA-TM-82882; NAS 1.15:82882) Avail: NTIS HC A02/MF A01 CSCL 11D

The Lewis Research Center is conducting a series of programs intended to investigate and develop the application of composite materials to structural components for turbojet engines. A significant part of that effort is directed to establishing resistance, defect growth, and strain rate characteristics of composite materials over the wide range of environmental and load conditions found in commercial turbojet engine operations. Both analytical and experimental efforts are involved. Author

ADDITIONAL EXPERIMENTS ON FLOWABILITY IMPROVEMENTS OF AVIATION FUELS AT LOW TEMPERATURES, VOLUME 2 Final Report
Francis J. Stockemer and Ronald L. Deane Aug. 1982 56 p refs
(Contract NAS3-21977)
(NASA-CR-167912; NAS 1.26:167912) Avail: NTIS HC A04/MF A01 CSCL 21D

An investigation was performed to study flow improver additives and scale-model fuel heating systems for use with aviation hydrocarbon fuel at low temperatures. Test were performed in a facility that simulated the heat transfer and temperature profiles anticipated in wing fuel tanks during flight of long-range commercial aircraft. The results are presented of experiments conducted in a test tank simulating a section of an outer wing integral fuel tank approximately full-scale in height, chilled through heat exchange panels bonded to the upper and lower horizontal surfaces. A separate system heated lubricating oil externally by a controllable electric heater, to transfer heat to fuel pumped from the test tank through an oil-to-fuel heat exchanger, and to recirculate the heated fuel back to the test tank. AN INVESTIGATION OF THE EFFECTS OF SMOKE SUPPRESSANT FUEL ADDITIVES ON ENGINE AND TEST CELL EXHAUST GAS OPACITIES Final Report, 1981
Donald W. Thornburg, Thomas R. Darnell, and David W. Netzer May 1982 116 p refs
(AD-A116171; NPS67-82-004) Avail: NTIS HC A06/MF A01 CSCL 21/4

Tests were conducted in a one-eighth scale turbojet test cell with a ramjet type combustor to investigate the effects of fuel additives on smoke reduction. Particle size and mass concentrations were determined at the engine and stack exhausts using three wavelength optical detector systems. Particulate samples were also collected at the engine exhaust and analyzed with a scanning electron microscope. Combustor temperature and fuel additives were found to significantly affect particulate mass concentrations emitted from the engine while particle size appeared to be unaffected. No significant changes in the particulate size or mass occurred from the engine exhaust to the stack exhaust. The optical determination of exhaust mean particulate size/mass concentration with three wavelength optical detector systems appears to be reasonably accurate technique for evaluating the effects of engine and test cell operating conditions and fuel composition changes on the emitted particulates. TRACKING PROBLEM
Target tracking using area correlation
A82-39194

Research on an adaptive Kalman filter for solving the radar tracking problem --- German thesis
A82-40562

TRAILING EDGES
Inflated wings
A82-40966

Development of an advanced no-moving-parts high-lift airfoil
A82-40971

TRAILING-EDGE FLAPS
Investigation of the unsteady airloads on a transport aircraft type airfoil with two interchangeable oscillating trailing edge flaps, at transonic speed and high Reynolds numbers
A82-40909

Determination of the efficiency of a trailing edge flap in unsteady three-dimensional flow
A82-40910

TRAINING AIRCRAFT
Development status of a composite vertical stabilizer for a jet trainer
A82-39891

Spin behaviour of the Pilatus PC-7 Turbo Trainer
A82-40970

A discussion of the flying quality requirements of a basic training aircraft
[AD-A114805] N82-29318

TRAINING ANALYSIS
Operational test and evaluation handbook for aircraft training devices. Volume 1: Planning and management
[AD-A112498] N82-29332

TRAINING DEVICES
Smoke abatement system for crash rescue/fire training facilities
[AD-A114380] N82-28268

TRAINING EVALUATION
Operational test and evaluation handbook for aircrew training devices. Volume 3: Operational suitability evaluation
[AD-A112569] N82-28306

Operational test and evaluation handbook for aircraft training devices. Volume 1: Planning and management
[AD-A112498] N82-29332

TRAINING SIMULATORS
Complete flexibility and realism in radar simulation
A82-38461

TRAJECTORIES
Wind tunnel studies of store separation with load factor. Freedrops and captive trajectories
N82-30261

TRAJECTORY ANALYSIS
User's manual for the AMEER flight path-trajectory simulation code
[DE82-007004] N82-29343

TRANSFER FUNCTIONS
The ideal controlled element for real airplanes is not K/s
[AIAA 82-1606] A82-38988

Investigation of low order lateral directional transfer function models for augmented aircraft
[AIAA 82-1610] A82-38989

The effects of atmospheric turbulence on a quadrotor heavy lift airship
[AIAA 82-1542] A82-39009

TRANSFORMATIONS (MATHEMATICS)
Applications to aeronautics of the theory of transformations of nonlinear systems
[NASA-TM-84249] N82-30013

TRANSMISSION
Advances in high-speed rolling-element bearings
[NASA-TM-82910] N82-28644

TRANSMISSION LINES
Feasibility study of a 270V dc flat cable aircraft electrical power distributed system
[AD-A114026] N82-28533

TRANSMISSIONS (MACHINE ELEMENTS)
Reliability model for planetary gear
[NASA-TM-82859] N82-28643

TRANSONIC FLIGHT
Wing design for supersonic cruise/transonic maneuver aircraft
A82-41027

TRANSONIC FLOW
Numerical solution of a problem concerning transonic flow past a wing-fuselage configuration
A82-[illegible]

A new Transonic Airfoil Design Method and its application to helicopter rotor airfoil design
A82-[illegible]

Calculations of transonic steady state aeroelastic effects for a canard airplane
A82-[illegible]

Viscous transonic airfoil flow simulation
A82-[illegible]

Transonic small disturbance code for body-wing configuration coupled with full potential code for wing alone
A82-[illegible]

A finite difference method for the calculation of transonic flow about a wing, based on small perturbation theory
[NLR-TR-81031-U] N82-[illegible]

TRANSONIC WIND TUNNELS
Aerodynamic behavior of a slender slot in a wind tunnel wall
A82-38281
Estimation of simulation errors in the European Transonic Wind Tunnel /ETW/
A82-40930
National Transonic Facility (NTF) prototype fan blade fatigue test
[AD-A114405] N82-28261
Programs for the transonic wind tunnel data processing installation. Part 8: Programs for processing data on the central site computer
[AD-A112900] N82-28310
Design basis for a new transonic wind tunnel
[AD-A112899] N82-28311
Windtunnel capability related to test sections, cryogenics, and computer-windtunnel integration
[AGARD-AR-174] N82-29334
Correlation of Preston-tube data with laminar skin friction (Log No. J12984)
[NASA-TM-84827] N82-29556

TRANSPORT AIRCRAFT
Investigation of the unsteady airloads on a transport aircraft type airfoil with two interchangeable oscillating trailing edge flaps, at transonic speed and high Reynolds numbers
A82-40909
A concept for 4D-guidance of transport aircraft in the TMA --- Terminal Manoeuvering Area
A82-40942
Experimental and theoretical studies of three-dimensional turbulent boundary layers on an empennage of a typical transport airplane
A82-40955
Requirements and trends in fuel consumption in transport mission with aircraft and surface vehicles
A82-40956
Aerodynamic concepts for fuel-efficient transport aircraft
A82-40957
Progress at Douglas on laminar flow control applied to commercial transport aircraft
A82-40958
A crack growth model under spectrum loading
A82-40961
Application of composite materials and new design concepts for future transport aircraft
A82-40994
Aerodynamic research applications at Boeing
A82-41000
Analysis of jet transport wings with deflected control surfaces by using a combination of 2- and 3-D methods
A82-41022
Analytical and simulator study of advanced transport
[NASA-CR-3572] N82-28290
Fireworthiness of transport aircraft interior systems
N82-29284
System data communication structures for active-control transport aircraft, volume 1
[NASA-CR-165773-VOL-1] N82-29510
System data communication structures for active-control transport aircraft, volume 2
[NASA-CR-165773-VOL-2] N82-29511

TRANSPORTATION
Maximizing South Carolina's aviation resources: Identifying potentially profitable commuter airline routes, volume 2
[PB82-139353] N82-29277

TRANSPORTATION ENERGY
Requirements and trends in fuel consumption in transport mission with aircraft and surface vehicles
A82-40956

TRAPEZOIDAL WINGS
An experimental investigation of leading-edge spanwise blowing
A82-40988

TROPOSPHERE
Two-dimensional model studies of the impact of aircraft exhaust emissions on tropospheric ozone
A82-40124

TRUSSES
Efficient optimum design of structures - Program DDDU
A82-38146

TU-144 AIRCRAFT
The technological aspects of titanium application in the TU-144 aircraft structure
A82-[illegible]

TURBINE BLADES
Comparison of HP turbine 'deep blade design' effects in turbofan engine gas generators with different bearing structure configurations
A82-40996

TURBINE ENGINES
An exploratory research and development program leading to specifications for aviation turbine fuel from whole crude shale oil. Part 1: Preliminary process analyses
[AD-A112681] N82-28462
An exploratory research and development program leading to specifications for aviation turbine fuel from whole crude shale oil. Part 2: Process variable analyses and laboratory sample production
[AD-A112682] N82-28463
An exploratory research and development program leading to specifications for aviation turbine fuel from whole crude shale oil. Part 3: Production of specification of JP-4 fuel from geokinetics shale oil
[AD-A112683] N82-28464
Aviation fuels-future outlook and impact on aircraft fire threat
N82-29302

TURBINE WHEELS
Sliced disc design - A composite conform concept for a turbo engine axial compressor
A82-40993

TURBINES
CF6 jet engine performance improvement: High pressure turbine active clearance control
[NASA-CR-165556] N82-28197
Cooled variable nozzle radial turbine for rotor craft applications
[NASA-CR-165397] N82-29323

TURBOCOMPRESSORS
The effect of intake flow disturbances on APU compressor blade high cycle fatigue in the Airbus A300
A82-40983
Sliced disc design - A composite conform concept for a turbo engine axial compressor
A82-40993
Multistage axial compressor program on tip clearance effects
[AD-A107445] N82-29325
Water ingestion into axial flow compressors. Part 3: Experimental results and discussion
[AD-A114830] N82-29326
Effect of water on axial flow compressors. Part 2: Computational program
[AD-A114831] N82-29327
Aerodynamics of advanced axial-flow turbomachinery
[AD-A114911] N82-29328

TURBOFAN ENGINES
Optimized 10 ton class commercial aircraft engine
A82-40990
Recent advances in the performance of high bypass ratio fans
A82-40991
Third generation turbo fans
A82-40994
Comparison of HP turbine 'deep blade design' effects in turbofan engine gas generators with different bearing structure configurations
A82-40996
Forward velocity effects on fan noise and the suppression characteristics of advanced inlets as measured in the NASA-Ames 40 by 80 foot wind tunnel
[NASA-CR-152328] N82-[illegible]

TURBOJET ENGINE CONTROL
Performance of a 2D-CD nonaxisymmetric exhaust nozzle on a turbojet engine at altitude
[AIAA PAPER 82-1137] A82-40418

TURBOJET ENGINES
Performance of a 2D-CD nonaxisymmetric exhaust nozzle on a turbojet engine at altitude
[AIAA PAPER 82-1137] A82-40418

HANSEN, H.
Investigation of the unsteady airloads on a transport aircraft type airfoil with two interchangeable oscillating trailing edge flaps, at transonic speed and high Reynolds numbers
A82-40909

HARRINGTON, W. W.
Terrain following/terrain avoidance system concept development
[AIAA PAPER 82-1518] A82-40428

HARRIS, G. L.
Electric propulsion for a mini RPV system
A82-39744

HARRIS, R. J.
Development of the Circulation Control Wing-Upper Surface Blowing powered-lift system for STOL aircraft
A82-40969

HARRIS, W. L.
Dynamic surface measurements on a model helicopter rotor during blade slap at high angles of attack
A82-40555

HAWORTH, L. A.
HISS calibration, ice phobics and FAA R/D evaluations
[AD-A114435] N82-28289

HEARON, B. F.
Comparative vertical impact testing of the F/FB-111 crew restraint system and a proposed modification
[AD-A113957] N82-28267

HEATH, B. O.
Engineering aspects of international collaboration on Tornado
A82-40878

HEBB, R. C.
Computer program for analysis of spherical screen distortion
[AD-A113136] N82-28309

HECKERT, C. H.
Carbon fiber reinforced composite structures protected with metal surfaces against lightning strike damage
[MBB-UD-340-82-O/E] N82-28364
Development of materials and manufacturing technology over the next 20 years: Composite materials
[MBB-UD-341-82-O] N82-28365

HEDMAN, S. G.
Calculations of transonic steady state aeroelastic effects for a canard airplane
A82-40882

HEFFLEY, R. K.
Pilot models for discrete maneuvers
[AIAA 82-1519] A82-38940

HEINBOLD, R. L.
The fourth dimension
A82-39540

HELLARD, G.
Operation V10F - Development of a composite material wing
A82-40934

HELMS, J. L.
Noise pollution and airport regulation
A82-40051

HENDERSON, J. C.
HISS calibration, ice phobics and FAA R/D evaluations
[AD-A114435] N82-28289

HENKE, R.
Leading edge separation at delta wings with curved leading edges in supersonic flow
A82-38784

HESS, R. A.
The effects of the delays on systems subject to manual control
A82-38943

HEUMANN, W.
Visual scene simulation concerning the landing of sporting aircraft in connection with investigations regarding the control and learning behavior of the pilot
A82-41447

HILAIRE, G.
Technical and economic comparison of carbon fiber tape and woven fabric applications
A82-40993

HILBIG, R.
Aerodynamic concepts for fuel-efficient transport aircraft
A82-40957

HILL, R. G.
The development and applications of a full-scale wide body test article to study the behavior of interior materials during a postcrash fuel fire
N82-29285

HILL, W. G., JR.
An investigation of scale model testing of VTOL aircraft in hover
A82-40911

HILLE, H. K.
USAF bioenvironmental noise data handbook. Volume 148. T-37B in-flight crew noise
[AD-A114943] N82-30031

HOAD, D. R.
Helicopter model scale results of blade-vortex interaction impulsive noise as affected by blade planform
A82-40556

HOCKENBERGER, R. I.
Operational test and evaluation handbook for aircraft training devices. Volume 1: Planning and management
[AD-A112498] N82-29332

HOCKENBERGER, R. L.
Operational test and evaluation handbook for aircrew training devices. Volume 3: Operational suitability evaluation
[AD-A112569] N82-28306

HODDER, D.
Wind tunnel modeling of rotor vibratory loads
A82-40516

HODGKINSON, J.
An alternate method of specifying bandwidth for flying qualities
[(AIAA 82-1609] A82-38988
Flying quality requirements for V/STOL transition
[AIAA PAPER 82-1293] A82-40276

HOFMANN, O.
Opto-electronical push-broom scanners for navigation, reconnaissance and generation of digital data bases
A82-39747

HOGE, F. E.
Baseline monitoring using aircraft laser ranging
[NASA-TM-73298] N82-28690

HOH, R. H.
An alternate method of specifying bandwidth for flying qualities
[(AIAA 82-1609] A82-38988
Handling qualities criteria for flight path control of V/STOL aircraft
[AIAA PAPER 82-1292] A82-39081
Flying quality requirements for V/STOL transition
[AIAA PAPER 82-1293] A82-40276
Flying qualities requirements for roll CAS systems
[AIAA PAPER 82-1356] A82-40287

HOLLINS, H. L.
Fuselage effects in leading edge vortex flap aerodynamics
A82-41006

HOLMES, B. J.
Observations and implications of natural laminar flow on practical airplane surfaces
A82-40893
Assessment of advanced technologies for high performance single-engine business airplanes
A82-40932

HOPKIN, V. D.
Human factors in air traffic control
[AGARD-AG-275] N82-29293

HOPKINS, A. L.
System data communication structures for active-control transport aircraft, volume 1
[NASA-CR-165773-VOL-1] N82-29510
System data communication structures for active-control transport aircraft, volume 2
[NASA-CR-165773-VOL-2] N82-29511

HOREFF, T. G.
Aircraft fire mishap experience/crash fire scenario quantitation
N82-29280

HORI, N.
Application of multivariable model following method to flight controller
[AIAA PAPER 82-1349] A82-39120

HOWELL, G. A.
Test results of chordwise and spanwise blowing for low-speed lift augmentation
A82-40999
HOWELL, W. D.
The development and applications of a full-scale wide body test article to study the behavior of interior materials during a postcrash fuel fire
N82-29285
HOWELL, W. E.
Heads up display
[NASA-CASE-LAR-12630-1] N82-29319
HOWISON, W. W.
Electronic/electric technology benefits study
[NASA-CR-165890] N82-28243
HSU, C.-H.
Effects of vortex breakdown on longitudinal and lateral-directional aerodynamics of slender wings by the suction analogy
[AIAA PAPER 82-1385] A82-39141
HU, Y.
Models for the motor state of VSCF aircraft electrical power system
A82-40982
HUANG, H. Y.
Multifunction multiband airborne radio architecture study
[AD-A114427] N82-28523
HUBBARD, J. E., JR.
Dynamic surface measurements on a model helicopter rotor during blade slap at high angles of attack
A82-40555
HUENECKE, K.
Low-speed characteristics of a fighter-type configuration at higa angles-of-attack and sideslip
A82-41020
HUIZING, G. H.
A finite difference metaod for the calculation of transonic flow about a wing, based on small perturbation theory
[NLR-TR-81031-U] N82-28263
HUMMEL, D.
Investigations regarding vortex formation at wings with bent leading edges
A82-38783
Vortex formation over double-delta wings
A82-40989
HUNT, L. R.
Applications to aeronautics of the theory of transformations of nonlinear systems
[NASA-TM-84249] N82-30013
HUSON, G. G.
Development of the Circulation Control Wing-Upper Surface Blowing powered-lift system for STOL aircraft
A82-40969
HWANG, D. P.
A summary of V/STOL inlet analysis methods
A82-40921
A summary of V/STOL inlet analysis methods
[NASA-TM-82885] N82-28249

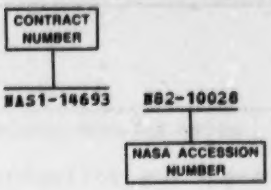
CONTRACT NUMBER INDEX

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

1982, Proceedings. Part 2. Research Triangle Park, NC, Instrument Society of America, 1982, p. 645-652.

Miniature sensors are needed for rapid and uncomplicated installation on light aircraft engaged in stability research programs. One particularly difficult sensor to miniaturize to the required degree has been a flow angle and velocity sensor for measuring the local flow ahead of a wing. However, by using an electrooptical technique it was possible to overcome the encountered difficulties and to design a sensor satisfying the requirements. The developed sensor for measuring angle-of-attack, yaw, and airspeed was shown to be suitable for rapid instrumentation of research aircraft because of its small size. The size reduction was accomplished by a design feature which eliminates the need for slip rings and wiring within the movable components of the sensor. G.R.

A82-41868 * A floating-point/multiple-precision processor for airborne applications. R. Yee (NASA, Ames Research Center, Moffett Field, CA). In: International Instrumentation Symposium, 28th, Las Vegas, NV, May 3-6, 1982, Proceedings. Part 2. Research Triangle Park, NC, Instrument Society of America, 1982, p. 857-864.
(Previously announced in STAR as N82-26289)

A82-41869 Integrated sensor system for flight test instrumentation. L. D. Plews (USAF Flight Test Center, Edwards AFB, CA). In: International Instrumentation Symposium, 28th, Las Vegas, NV, May 3-6, 1982, Proceedings. Part 2. Research Triangle Park, NC, Instrument Society of America, 1982, p. 865-873.

The motivation for the integrated sensor system (ISS) was to take advantage of advances in strapdown inertial navigation systems and microcomputer technology to improve flight test efficiency at lower cost by providing a standard interface with the data acquisition system, aircraft sensors, and onboard flight-/navigation computers. The ISS will generate flight test data in a form which can be used to document the aerodynamic properties of the test aircraft. Flight tests applications are related to performance testing, stability and control testing, and pre and poststall flying qualities testing. Attention is given to data accuracy, sensors for performance and flying qualities testing, a system definition, the ISS computer, the ISS interface, the inertial measurement unit, the air data system, and aspects of implementation. G.R.

A82-41881 # Requirements and possible design choices for improving the operation of aircraft in the terminal control area (Requisiti e possibili scelte di progetto per migliorare la operatività degli aeromobili in area di controllo terminale). F. Bossa. *Ingegneria,* May-June 1982, p. 130-136. 6 refs. In Italian.

Ways to optimize operations in the terminal control area are discussed with particular reference to the Terminal Configured Vehicle Program. Attention is given to criteria for the design of aircraft that are compatible with the terminal control area. Questions of aircraft noise and airport congestion are examined. B.J.

A82-41888 Hover jam - US Army studies EW helicopter. D. Boyle. *Interavia,* vol. 37, Aug. 1982, p. 760-762.

An airborne radar jamming system (ARJS) has been conceived to provide tactical jamming and operational flexibility necessary to suppress enemy radars (e.g., surveillance, anti-mortar, and anti-artillery radars) to protect attack helicopters and close air support aircraft. The ARJS electronic system is similar to EA-6B and EF-111 systems, but is lighter and simpler. Three frequency bands would have to be covered by the ARJS, reducing power and cooling requirements, as opposed to eight covered by the EF-111 system; but within these three bands, more radar frequencies would have to be covered. The ALQ-99 tactical jamming system is fundamental to the ARJS, and developments include mechanically steerable antennas in the pods. Other developments are underway such as the use of phased lens arrays, and an increased need for battlefield support jamming is foreseen. R.K.R.

A82-41914 Acoustic emission inspection of aircraft engine turbine blades for intergranular corrosion. W. D. Feist (Motoren- und Turbinen-Union München GmbH, Munich, West Germany). *NDT International,* vol. 15, Aug. 1982, p. 197-200.

The depth of the intergranular corrosion on turbine blades is of decisive significance with regard to their suitability for continued use. An acoustic emission method is introduced that is suitable for examination of blades during regular engine overhaul and which permits a statement on the depth of the corrosion to be made. (Author)

A82-41951 Long-range radio NAVAID signal reliability. W. B. Ruhnow (Rockwell International Corp., Cedar Rapids, IA). *Navigation,* vol. 29, Summer 1982, p. 152-159.

The results of a continuing study of Loran-C, VLF communication and Omega long range radio navigation signal reliability are updated. MTBF and mean time to repair statistics are given for the ground stations of the three systems, and trends in failure statistics from late 1973 to 1981 are presented in yearly and half-year intervals. The trends show that while the Loran-C signal reliability has improved significantly in recent years, VLF communication stations show random fluctuations which degrade performance in certain years and Omega signal integrity has remained constant since 1973. The 1981 probability of completing a stated mission of given duration is calculated for each transmitter type in zero- or two-station redundancy situations. The redundant signal coverage calculations show that airborne equipment should be structured to take advantage of redundant signals which have good geometry. O.C.

A82-42035 1980 Conference on Propeller Propulsion, Dayton, OH, April 22-24, 1980, Proceedings. Conference sponsored by AIAA, AHS, SAE, and University of Dayton. Edited by B. Lindenbaum, D. L. Quam, W. T. Grady (Dayton, University, Dayton, OH), J. R. Hunter (Boeing Co., Seattle, WA), E. J. Leach (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT), and J. J. Lusczek, Jr. (USAF, Washington, DC). New York, American Institute of Aeronautics and Astronautics, 1982. 157 p. $25.

Following a report on conference results, and a series of reports on the deliberations of panels on aircraft design and manufacture, propulsion system performance, propulsion hardware design and manufacture, and noise and vibration, the topics presented at this conference on the development status of propeller and propeller fan aircraft propulsion systems include Navy, Air Force and Commercial user views of propeller propulsion, the application of this technology to general aviation aircraft, and NASA research on low to high speed propeller systems. Also considered are the aerodynamic and structural analyses of propeller fan systems, the mechanical drive requirements of turboshaft gas turbine engines, the prospective fuel efficiency gains of state-of-the-art propeller propulsion systems, and the aerodynamic compatibility of propellers and the wing and fuselage flows with which they interact. O.C.

A82-42055 † Models for controlling reliability in aviation (Modeli upravleniia nadezhnost'iu aviatsionnoi tekhniki). V. P. Molomin. Moscow, Izdatel'stvo Mashinostroenie, 1981 200 p. 91 refs. In Russian.

Ways of formalizing and optimizing the control of reliability are considered, with an allowance made for the maintainability and useful life of parts and units that are serviced in processes that involve several stages (the extent of control differing in each stage). The mathematical models required to provide the basis for the operational control actions that are optimum in relation to reliability control are elaborated. C.R.

A82-42059 † Repair and maintenance of buildings in civil aviation (Ekspluatatsiia i remont zdanii grazhdanskoi aviatsii). A. M. Malyshkov and Iu. Ia. Berlin. Moscow, Izdatel'stvo Transport, 1981. 224 p. 28 refs. In Russian.

Basic information is presented in this handbook on the repair and maintenance of civil-aviation buildings, with particular reference to the situation in the Soviet Union. A classification of such buildings is presented, and their structural and equipment requirements are considered. Regulations concerning the planning, financing, and organization of repair operations are examined. B.J.

A82-42063 † Structural strength of materials and parts of gas turbine engines (Konstruktsionnaia prochnost' materialov i detalei gazoturbinnykh dvigatelei). I. A. Birger, B. F. Balashov, R. A. Dul'nev, T. P. Zakharova, L. A. Kozlov, A. N. Petukhov, and R. N. Sizova. Moscow, Izdatel'stvo Mashinostroenie, 1981. 224 p. 90 refs. In Russian.

Aspects of the study of the fatigue strength, thermal fatigue, and long-term strength of the materials and parts of gas turbine engines are reviewed. Particular consideration is given to fatigue-test methods, low-cycle fatigue under isothermal and nonisothermal loading, and determinate and statistical models of fracture. B.J.

A82-42066 † A history of aerostatics and aviation in Russia - In the period up to 1914 /2nd revised and enlarged edition/ (Istoriia vozdukhoplavaniia i aviatsii v Rossii - Period do 1914 g /2nd revised and enlarged edition/). P. D. Duz'. Moscow, Izdatel'stvo Mashinostroenie, 1981. 272 p. 52 refs. In Russian.

A history of the planning and building of piloted balloons, dirigibles, and airplanes in Russia, focusing on the period 1861-1914, is presented based on an extensive use of archival and published documentation. Following a survey of the designing and testing of piloted balloons up to 1861, the development of theoretical aerodynamics in Russia is examined, including the work of Tsiolkovskii and Zhukovskii. The pioneer efforts in the construction of airplanes in Russia are treated in detail, including the first airplanes designed and built by Sikorsky. N.B.

A82-42067 † Aircraft radio communications equipment: Design and use (Samoletnoe radiooborudovanie sviazi: Ustroistvo i ekspluatatsiia). A. P. Shved, Iu. V. Efremenkov, and F. F. Tiagun. Moscow, Izdatel'stvo Transport, 1981. 264 p. In Russian.

Descriptions are given of the Mikron and Landysh radio sets, the SPU-7 interphone, the SGS-25 loudspeaker system, and the Arfa-MB, MS-61, and Mars-BM tape recorders. Attention is also given to the operation of the equipment and to prospects for the development of shortwave and ultrashort-wave radio sets. C.R.

A82-42176 **Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings.** Symposium sponsored by IEEE, AIAA, ASME, et al. New York, Institute of Electrical and Electronics Engineers, 1982. 548 p. Members, $30.; nonmembers, $40.

Topics considered include reliability and the rare event, life-cycle costing, screening, new developments in analysis, software reliability, equipment readiness, new developments in mathematics and modeling, R&M data systems, new developments in testability, manufacturing reliability, and reliability testing. Case histories are presented on mechanical reliability, energy, consumer and industrial projects, maintainability, transportation, and military and aerospace. Aspects of reliability in the Space Shuttle program are discussed. B.J.

A82-42178 **Repair-discard concepts in design.** J. K. Seger (Lockheed-California Co., Burbank, CA). In: Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1982, p. 21-24.

The repair-discard and expanded repair-level analysis methodology is being developed at Lockheed, and initial experience shows that this methodology is a practical means for determining LRU (line replaceable unit) and SRU (shop replaceable unit) maintenance policy. This methodology provides a structured approach for proposing design changes and for assessing the impact of economic and operational factors when the objective is to achieve mission and readiness requirements at a minimum life cycle cost. The methodology complements the logistic support analysis process of MIL-STD 1388. B.J.

A82-42181 # **R/M/LCC effects of commercial off-the-shelf equipment.** P. R. MacDiarmid, A. D. Pettinato (USAF, Rome Air Development Center, Griffiss AFB, NY), and B. G. Johnson (Rockwell International Corp., Cedar Rapids, IA). In: Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1982, p. 40-46. 8 refs.

This paper addresses the effects of using commercial off-the-shelf equipment in military environments. Comparisons are made of military vs commercial reliability approaches and an analytical approach for choosing the most appropriate acquisition strategy is presented. Life cycle cost comparisons are made of commercial off-the-shelf equipment vs similar militarized equipment in military environments. Examples are presented of assessing risks under varying applications and choosing the best acquisition strategy. (Author)

A82-42206 # **F-16 Centralized Data System /CDS/.** G. M. Arnold (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). In: Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1982, p. 326-328.

This paper describes a data system developed for the F-16 System Program Office (SPO). This Centralized Data System (CDS) contains F-16 maintenance, operational, and configuration data which is used for engineering and management information. Existing data sources within the Air Force are used and special queries and transmission procedures were developed. The existing data sources utilized included various base level tapes. These tapes contain operational and maintenance information and are updated on a daily basis. Mitron tape transmitters are then used to transfer the data from the base locations to the contractor's centralized computers. The contractors facility uses two Honeywell 852s and a Honeywell 820 to process and store the information. (Author)

A82-42208 **Economic analysis for data base management.** F. M. Hall (Evaluation Research Corp., Arlington, VA). In: Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1982, p. 343-352. 11 refs.

The purpose of this paper is to establish those factors which must be evaluated and properly structured to institute a cost effective field data collection system to support a system readiness improvement program. Factors outlined in this paper represent decision points to tailor a data collection system which effectively contributes to a readiness improvement program at a level which is equal to the cost of the data system. Cost-effectiveness is determined through a detailed evaluation and comparison of: (1) the cost of obtaining information; and (2) the value and benefits of information obtained. In order to relate some practical experience in the use of field data for operational readiness improvement, a brief review is provided on Department of Defense experience with large-scale field data collection systems. The proposed analysis procedure does not assume that a dedicated readiness data collection system is required for any program. The functions of data collection and analysis are evaluated for return on investment in the same manner as other systems effectiveness engineering elements within a program. If a cost-benefit analysis of a proposed data collection system indicates a low rate of return, resources should be reallocated to other functions, such as reliability design analysis, parts and material control, production readiness planning, or testing. (Author)

A82-42210 **Fault isolation BITE for increased productivity.** C. R. Stander (Boeing Commercial Airplane Co., Seattle, WA). In: Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1982, p. 365-369.

The paper discusses the potential effect of fault isolation on productivity, the development of BITE (built-in test equipment) on the 757/767 aircraft, and a new analytical method for verifying the level of system fault isolation efficiency. It is noted that the 757/767 BITE is designed for the mechanic, not the engineer. It eliminates such problems as the inability to deal with intermittent faults, and is expected to lead to improved aircraft productivity through improved schedule reliability and decreased maintenance cost. B.J.

A82-42211 # **Analysis of built-in-test accuracy.** D. Gleason (USAF, Rome Air Development Center, Griffiss AFB, NY). In: Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1982, p. 370-372.

Built-in-test (BIT) accuracy is a combined measure of fault detection capability and false alarm occurrences. This paper provides a Markovian analysis of BIT accuracy. The results of the analysis are used to develop tradeoff techniques for achieving optimal BIT accuracy levels. (Author)

A82-42216 **R & M characteristics of a Microwave Landing System.** W. R. Belcher (Amalgamated Wireless (Australasia), Ltd., North Ryde, New South Wales, Australia) and R. E. Kuehn (Kuehn and Co., North Ryde, New South Wales, Australia). In: Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1982, p. 404-407. 10 refs.

The function, performance and hardware implementation of the Time Reference Scanning Beam (TRSB) Interscan Microwave Landing System (MLS) are briefly discussed. Reliability and Maintainability (R and M) design goals for MLS are established. Selected aspects of R and M design support to monitor and optimize implementation are discussed, and the R and M status of an Interscan prototype system assessed. (Author)

A82-42217 **Computer Monitored Inspection Program /CMIP/, a key to increased aircraft and personnel productivity.** H. D. Hall (Lockheed-Georgia Co., Marietta, GA). In: Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1982, p. 408-416.

A computer program has been developed which permits maintenance managers to maintain aircraft scheduled inspection programs in a dynamic and cost-effective configuration. This program, which is called CMIP (Computer Monitored Inspection Program), was specifically designed to increase the aircraft's and the maintenance manager's productivity by assisting the maintenance manager in evaluating the effectiveness of scheduled maintenance programs. The CMIP gives the maintenance manager the ability to keep inspection programs dynamic and cost-effective while simultaneously maintaining inherent design levels of safety and reliability. (Author)

A82-42229 **F/A-18 Hornet reliability challenge - Status report.** M. P. Ricketts (McDonnell Aircraft Co., St. Louis, MO). In: Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1982, p. 491-496.

A development status report is given for the F/A-18 Hornet Reliability Program, in which an attempt is made to give reliability criteria the same design emphasis as weight, performance and cost. Among the established reliability assurance techniques applied are periodic status assessments for each subsystem manager, failure mode and affects analyses, an approved parts list, selective use of Sneak Circuit Analysis, and a closed loop evaluation and reporting system which reports and tracks all equipment failures. The F/A-18's 3.7-hour mean flight time between failures (MFTBF) requirement was tested in 50 Reliability Demonstration flights, and an 8.4-hour MFTBF was demonstrated. The F/A-18 incorporates such high inherent reliability design components as solid state avionics, improved avionics cooling, a fixed-geometry engine air inlet, simpler hydraulics, and the highly simplified F404 engine. O.C.

A82-42462 † **Mathematical models of rotor strength and optimization in computer-aided design (Matematicheskie modeli prochnosti i optimizatsii rotorov pri avtomatizirovannom proektirovanii).** I. V. Dem'ianushko, V. V.

range of 0.6 to 0.95 and at Reynolds numbers 4 million to 6 million. Results show the superiority of supercritical airfoil design. This is explained, referring to overall aerodynamic coefficients, limits of efficiency, and in special cases to pressure distributions. Author (ESA)

AIRCRAFT ICING RESEARCH AT NASA
J. J. Reinmann, R. J. Shaw, and W. A. Olsen, Jr. 1982 17 p refs Presented at the 1st Intern. Workshop on Atmospheric Icing of Struct., Hanover, N.H., 1-3 Jun. 1982
(NASA-TM-82919; E-1307; NAS 1.15:82919) Avail: NTIS HC A02/MF A01 CSCL 01C

Research activity is described for: ice protection systems, icing instrumentation, experimental methods, analytical modeling for the above, and in flight research. The renewed interest in aircraft icing has come about because of the new need for All-Weather Helicopters and General Aviation aircraft. Because of increased fuel costs, tomorrow's Commercial Transport aircraft will also require new types of ice protection systems and better estimates of the aeropenalties caused by ice on unprotected surfaces. The physics of aircraft icing is very similar to the icing that occurs on ground structures and structures at sea; all involve droplets that freeze on the surfaces because of the cold air. Therefore all icing research groups will benefit greatly by sharing their research information. Author

AERODYNAMIC PENALTIES OF HEAVY RAIN ON A LANDING AIRCRAFT Final Report
Patrick A. Haines and James K. Luers Jul. 1982 72 p refs
(Grant NsG-6026)
(NASA-CR-156885; NAS 1.26:156885; UDR-TR-82-26) Avail: NTIS HC A04/MF A01 CSCL 01C

The aerodynamic penalties of very heavy rain on landing aircraft were investigated. Based on severity and frequency of occurrence, the rainfall rates of 100 mm/hr, 500 mm/hr, and 2000 mm/hr were designated, respectively, as heavy, severe, and incredible. The overall and local collection efficiencies of an aircraft encountering these rains were calculated. The analysis was based on raindrop trajectories in potential flow about an aircraft. All raindrops impinging on the aircraft are assumed to take on its speed. The momentum loss from the rain impact was later used in a landing simulation program. The local collection efficiency was used in estimating the aerodynamic roughness of an aircraft in heavy rain. The drag increase from this roughness was calculated. A number of landing simulations under a fixed stick assumption were done. Serious landing shortfalls were found for either momentum or drag penalties and especially large shortfalls for the combination of both. The latter shortfalls are comparable to those found for severe wind shear conditions. Author

The Air Force installed a Fuel Savings Advisory System (FSAS) in three C-141 aircraft and performed an operational test and evaluation. At the request of the USAF Airlift Center, observers from the USAF School of Aerospace Medicine evaluated human-engineering, workload, and fatigue aspects of FSAS during three long-duration missions. Pilot's subjective fatigue/workload reports, interviews with crewman, and human-engineering analyses indicated that the FSAS was satisfactory for use in MAC airlift operations. Human-engineering solutions are provided, also suggestions for future improvement of the FSAS. Author (GRA)

Integration of dual helmet-mounted displays, a helmet-attitude tracking device, a six-degree of freedom fighter aircraft digital simulation and dynamic stereo-pair computer graphics line drawings permitted overlaying 3-D (stereo) information on a pilot's view of the world. Display content for weapon delivery and 4-D navigation was investigated. A second display medium using a forward projection, TV, and PLZT goggles was incorporated to aid in the training process. This report documents what was learned in developing and evaluating the displays. Author (GRA)

DESIGN AND IMPLEMENTATION OF USAF AVIONICS INTEGRATION SUPPORT FACILITIES M.S. Thesis
Jon G. Hanson Dec. 1981 337 p refs
(AD-A115537; AFIT/GCS/EE/81D-10) Avail: NTIS HC A15/MF A01 CSCL 01/3

The design and implementation of avionic software support facilities known as Avionic Integration Support Facilities (AISFs) are investigated. A complete set of AISF functional requirements is presented in Data Flow Diagram format. This method of presentation facilitated the hierarchical development of the functional requirements. From these functional requirements an implementation model for such a facility is developed. The modeling vehicle used is Softech's Structured Analysis and Design Technique (SADT). The SADT model depicts inputs, outputs, processes, controls, and the mechanisms required to implement the AISF. Author (GRA)

A PRELIMINARY ANALYSIS OF TF34-100/400 JET ENGINE

REWORK DATA IN SUPPORT OF THE MRP SYSTEM IMPLEMENTATION AT NARF ALAMEDA M.S. Thesis
Ernest R. Slaybaugh Dec. 1981 83 p refs
(AD-A114452) Avail: NTIS HC A05/MF A01 CSCL 15/5

The Naval Air Rework Facility (NARF) located at Naval Air Station (NAS) Alameda is in the process of implementing a Material Requirements Planning (MRP) system which will incorporate an inventory model to help manage those repair parts which are not always replaced during component rework. This thesis focused on analyzing TF34-100/400 jet engine rework data as one phase of that implementation. In particular, probability of replacement values were generated for the repair parts from demand data and the rework schedule during 1980, and the engine's bill of materials. In addition, a parametric analysis was conducted to study the optimal relationship between the shortage and surplus costs of the proposed inventory model for the TF34 repair parts. The analyses highlighted the importance of determining the actual shortage costs resulting from a work stoppage and suggested some potentially useful forms for the surplus cost parameter. REMOTE SENSING OF TURBINE ENGINE GASES Final Report, 1 Oct. 1980 - 30 Sep. 1981
Dennis K. Killinger, Norman Menyuk, and Aram Mooradian 30 Sep. 1981 81 p refs
(Contract F19628-80-C-0002; AF Proj. 1900)
(AD-A115443; ESD-TR-82-014; AFESC/ESL-TR-82-016)
Avail: NTIS HC A05/MF A01 CSCL 20/5

This is the FY 81 final report on the program entitled 'Remote Sensing of Turbine Engine Gases'. The specific tasks which were conducted during FY 81 consisted of the following: (1) the feasibility demonstration of a dual-laser differential-absorption LIDAR(DIAL) system for the remote sensing of CO, NO, and C2H4, (2) the development of a data acquisition and processing system for the dual-laser DIAL system, (3) the laser remote sensing of CO and C2H4 in the exhaust of a stationary jet aircraft, and (4) the laser remote sensing of hydrazine, monomethylhydrazine (MMH), and unsymmetrical dimethylhydrazine (UDMH). THE LATERAL RESPONSE OF AN AIRSHIP TO TURBULENCE M.S. Thesis
John J. Wrobleski, Jr. Dec. 1981 151 p refs
(AD-A115197) Avail: NTIS HC A08/MF A01 CSCL 20/4

A method is derived for finding the linear response and loading transfer functions for the lateral aerodynamic case of airship flight through atmospheric turbulence. The functions obtained are in a form that can be applied to the various spectral analysis methods used to predict survivability currently employed by designers. A numerical example using the USS AKRON (ZR-4) is presented. The results show that peak motion response and loading occur when the encountered spectral component has a wavelength equal to the airship length, and that simple feedback of heading angle does not significantly decrease this peak. OPTIMAL PERIODIC DOLPHIN GLIDING FLIGHT [OPTIMALER PERIODISCHER DELPHIN-SEGELFLUG]
E. D. Dickmanns Feb. 1982 48 p refs In GERMAN
Avail: NTIS HC A03/MF A01

Numerically calculated time optimal flight paths through vertical wind fields are discussed for different wind field types and airplane classes. For solution types 1 (prefers speed to altitude, globally optimal for small wind fields), the ratio of path oscillation wavelength to up-wind field wavelength was chosen as criterion for global optimization. The most favorable control sequence as well as the most favorable periodic boundary values for the speed components are determined. Calculations on examples for three wind field families and three airplane types with the best reciprocal glide numbers 29, 41, and 55, show that the unstationary type 2 the for aerodynamically highly sophisticated airplanes with large wing load (water ballast) are more meaningful than for conventional gliders with small wing load. ANALYSIS AND PREPARATION OF A DIGITAL TERRAIN DATA BASE FOR FLIGHT SIMULATOR USE M.S. Thesis
Harry D. Ross Nov. 1981 68 p refs
(AD-A115547; AFIT/GEO/MA-81D-1) Avail: NTIS HC A04/MF A01 CSCL 06/6

The Air Force needs low-level, high speed flight simulators capable of producing correlated visual, radar, and infra-red display scenes. These scenes can be produced by computer generated imagery if a suitable data base is available. The purpose of this thesis is to develop a digital terrain data base suitable for use in a high speed, low-level flight simulator. A 164,000 square nautical mile data base was constructed from data supplied by the Defense Mapping Agency. This paper discussed the construction and organization of the data base, as well as the data retrieval algorithms. It was demonstrated that the data could be accessed fast enough to simulate Mach 1 flight. Author (GRA)

HIGH TEMPERATURE COMPOSITES. STATUS AND FUTURE DIRECTIONS
Robert A. Signorelli 1982 25 p refs Presented at the 4th Intern. Conf. on Composite Mater., Tokyo, 25-28 Oct. 1982
(NASA-TM-82929; E-1280; NAS 1.15:82929) Avail: NTIS HC A02/MF A01 CSCL 11D

A summary of research investigations of manufacturing methods, fabrication methods, and testing of high temperature composites for use in gas turbine engines is presented. Ceramic/ceramic, ceramic/metal, and metal/metal composites are considered. Directional solidification of superalloys and eutectic alloys, fiber reinforced metal and ceramic composites, ceramic fibers and whiskers, refractory coatings, metal fiber/metal composites, matrix metal selection, and the preparation of test specimens are discussed. J.D.

REAL TIME ESTIMATION AND PREDICTION OF SHIP MOTIONS USING KALMAN FILTERING TECHNIQUES

Michael A. Triantafyllou, Marc Bodson, and Michael Athans Jul. 1982 142 p refs

(Grant NGL-22-009-124)

(NASA-CR-169284; NAS 1.26:169284; LIDS-R-1220) Avail: NTIS HC A07/MF A01 CSCL 20D

A landing scheme for landing V/STOL aircraft on rolling ships was sought using computerized simulations. The equations of motion as derived from hydrodynamics, their form and the physical mechanisms involved and the general form of the approximation are discussed. The modeling of the sea is discussed. The derivation of the state-space equations for the DD-963 destroyer is described. Kalman filter studies are presented and the influence of the various parameters is assessed. The effect of various modeling parameters on the rms error is assessed and simplifying conclusions are drawn. An upper bound for prediction time of about five seconds is established, with the exception of roll, which can be predicted up to ten seconds ahead. R.J.F.

LAMINAR FLOW CONTROL, 1976 - 1982: A SELECTED ANNOTATED BIBLIOGRAPHY

Marie H. Tuttle and Dal V. Maddalon Aug. 1982 82 p

(NASA-TM-84496; L-15434; NAS 1.15:84496) Avail: NTIS HC A05/MF A01 CSCL 20D

Laminar Flow Control technology development has undergone tremendous progress in recent years as focused research efforts in materials, aerodynamics, systems, and structures have begun to pay off. A virtual explosion in the number of research papers published on this subject has occurred since interest was first stimulated by the 1976 introduction of NASA's Aircraft Energy Efficiency Laminar Flow Control Program. The purpose of this selected bibliography is to list available, unclassified laminar flow (both controlled and natural) research completed from about 1975 to mid 1982. Some earlier pertinent reports are included but listed separately in the Appendix. Reports listed herein emphasize aerodynamics and systems studies, but some structures work is also summarized. Aerodynamic work is mainly limited to the subsonic and transonic sped regimes. Because wind-tunnel flow qualities, such as free stream disturbance level, play such an important role in boundary-layer transition, much recent research has been done in this area and it is also included. DEVELOPMENT AND UTILIZATION OF A LASER VELOCIMETER SYSTEM FOR A LARGE TRANSONIC WIND TUNNEL

Robert J. Freedman and John P. Greissing Jun. 1982 17 p refs

(NASA-TM-82886; E-1264; NAS 1.15:82886) Avail: NTIS HC A02/MF A01 CSCL 14B

The need for measurements of the velocity flow field about spinner propeller nacelle configurations at Mach numbers to 0.8 was met by a specially developed laser velocimeter system. This system, which uses an argon ion laser and 4 beam 2 color optics, was required to operate in the hostile environment associated with the operation of a large transonic wind tunnel. To overcome the conditions present in locating the sensitive optics in close proximity to the wind tunnel, an isolation system was developed. The system protects the velocimeter from the high vibrations, elevated temperatures, destructive acoustic pressures and low atmospheric pressures attendant with the operation of the wind tunnel. The system was utilized to map the flow field in front of, behind and in between the rotating blades of an advanced swept blade propeller model at a Mach number of 0.8. The data collected by the system will be used to correlate and verify computer analyses of propeller nacelle flow fields and propeller performance. R.J.F.

EXPERIMENTAL INVESTIGATION OF AEROELASTIC INSTABILITY OF OPEN FIELD THIN PROFILES [INDAGINE SPERIMENTALE SUL'INSTABILITA AEROELASTICA DI PROFILI SOTTILI APERTI]

G. Casarico (Soc. Anonima Elettrificazione SPA), S. DePonte, and P. Faggiano (Soc. Anonima Elettrificazione SPA) 1981 11 p In ITALIAN Presented at Coll. dei Tec. dell'Acciaio (CTA) Giornate Ital. della Costruzione in Acciaio, Palerma, Italy, Oct. 1981

Avail: Issuing Activity

The behavior of thin wall metal profiles under oscillating aerodynamic loads was investigated in a wind tunnel. The beams were held by elastic constraint, being able to move in all directions, while the air incidence angle was varied throughout the experiments. Three types of transient response characterized by one or two critical wind velocities and either flexional or torsional vibration, which are related to the profile characteristics and the wind incidence, are described. Author (ESA)

LARGE DISPLACEMENTS AND STABILITY ANALYSIS OF NONLINEAR PROPELLER STRUCTURES

Robert A. Aiello 1982 18 p refs Presented at the 10th NASTRAN User's Colloq., New Orleans, 13-14 May 1982

(NASA-TM-82850; NAS 1.15:82850) Avail: NTIS HC A02/MF A01 CSCL 20K

The use of linear rigid formats in COSMIC NASTRAN without DMAP procedures for the analysis of nonlinear propeller structures is described. Approaches for updating geometry and applying follower forces for incremental loading are demonstrated. Comparisons are made with COSMIC NASTRAN rigid formats and other independent finite element programs. Specifically, the comparisons include results from the four approaches for updating the geometry using RIGID FORMAT 1, RIGID FORMATS 4 and 13, MARC and MSC/NASTRAN. It is shown that 'user friendly' updating approaches (without DMAPS) can be used to predict the large displacements and instability of these nonlinear structures. These user friendly approaches can be easily implemented by the user and predict conservative results. Author

STRESS INTENSITY FACTORS FOR RADIAL CRACKS AT OUTER SURFACE OF A PARTIALLY AUTOFRETTAGED CYLINDER SUBJECTED TO INTERNAL PRESSURE Final Report
S. L. Pu May 1982 50 p refs
(DA Proj. 1L1-61102-AH-60)
(AD-A116396; ARLCB-TR-82003) Avail: NTIS HC A03/MF A01 CSCL 12/1

The functional stress intensity factor approach which combines the finite element, thermal simulation and weight function methods developed for the computation of stress intensity factors for multiple radial cracks at the inner surface of a partially autofrettaged cylinder is applied in this report to external cracks. Numerical results of stress intensity factors are obtained for a cylinder with outer diameter twice the inner diameter. A slight increase into the degree of autofrettage will increase stress intensity factors of inner cracks slightly but will decrease stress intensity factors of external cracks considerably. As in the inner crack case, the cylinder with two diametrically opposed external cracks is in general the weakest configuration and for more than two cracks, the stress intensity factor decreases as the number of external cracks increase. AERODYNAMIC FORCES ACTING ON THE BLADES OF STALL REGULATED PROPELLER TYPE WINDMILLS
F. Rasmussen Aug. 1981 37 p refs In DANISH
(DE82-901178; RISO-M-2316) Avail: NTIS (US Sales Only) HC A03/MF A01; DOE Depository Libraries; also available from Risoe Library, DK-4000, Roskilde, Denmark

Aerodynamic forces acting on the blades of stall regulated propeller type windmills are discussed. The expected dynamic behavior of the loads are outlined. Great dynamic loads under stall condition and skew wind (yaw or tilt) are shown by theoretical calculations from the blade element theory for one typical design. The forces on the three blades are calculated as well as the total forces from the rotor acting on the main shaft. Blade strut forces on a 10 m diameter, three blades Riisager windmill are measured. Dynamic System Coupling (DYSCO) is a computer program which allows an interactive user to couple arbitrary components and force algorithms into a model of a helicopter or other dynamic system. The equations of the system may then be solved by a choice of analytical methods. The components available are rigid blade rotor, elastic fuselage, rotor control system, and other structures representable by general linear second-order differential equations. The force methods available are linear rotor loads, tabular rotor aerodynamics with optional induced velocity map, fuselage flat plate drag, and sinusoidal shaker. The solution methods available are time history, linear constant coefficient eigenanalysis, and complex frequency response. The program has the capability of being expanded in its level of complexity by the addition of other technology modules. Author (GRA)

DEICING
Aircraft icing research at NASA
[NASA-TM-82919] N82-30297
Study of the de-icing properties of the ASDE-3 rotodome
[AD-A115445] N82-31335

DESIGN ANALYSIS
Repair-discard concepts in design
A82-42178
Design and analysis of advanced composite structures
A82-42670
Applied flight mechanics in the design and in flight tests
A82-43327
Processes and procedural approaches in the aerodynamic design of the Alpha Jet aircraft
A82-43328
New approaches to fighter design
A82-44218
Design and implementation of USAF avionics integration support facilities
[AD-A115537] N82-30307
Functional design to support CDTI/DABS flight experiments
[NASA-CR-165947] N82-31326
Design of advanced digital flight control systems via Command Generator Tracker (CGT) synthesis methods, volume 1
[AD-A115510] N82-31331

DESIGN TO COST
Design to life cycle cost capability of the PRICE models
[IAF PAPER 82-221] A82-44695

DETECTION
Utilization of AN/APS-94 side-looking airborne radar systems in search and rescue
[AD-A114484] N82-30437

DIGITAL RADAR SYSTEMS
A new class of routing protocols for a proposed computer network linking tactical radar sites
A82-43893

DIGITAL SIMULATION
Simulation in connection with the development of the Alpha Jet aircraft
A82-43333
Design of advanced digital flight control systems via Command Generator Tracker (CGT) synthesis methods, volume 2
[AD-A115511] N82-31332

DIGITAL SYSTEMS
NASA studies business aircraft avionics
A82-43659
Design of advanced digital flight control systems via Command Generator Tracker (CGT) synthesis methods, volume 1
[AD-A115510] N82-31331

DIRECTIONAL CONTROL
Pilot opinions of sampling effects in lateral directional control
N82-30849

DISPLACEMENT
Large displacements and stability analysis of nonlinear propeller structures
[NASA-TM-82850] N82-31707

DISPLAY DEVICES
New image generators for the next generation of civil aircraft
[SEE PAPER 811767] A82-44236
Analysis and preparation of a digital terrain data base for flight simulator use
[AD-A115547] N82-30315
Evaluation of the FAA/MITRE weather data device
[AD-A114646] N82-30800

Pilot/vehicle model analysis of visual and motion cue requirements in flight simulation N82-30838
Application of a pilot control strategy identification technique to a joint FAA/NASA ground based simulation of head up displays for CTOL aircraft N82-30857
Design, simulation and evaluation of advanced display concepts for the F-16 control configured vehicle N82-30859
Separation monitoring with four types of predictors on a cockpit display of traffic information N82-30860
Functional design to support CDTI/DABS flight experiments [NASA-CR-165947] N82-31326
Wide-angle, multiviewer, infinity display system [AD-A116308] N82-31336

DITCHING (LANDING)
Improving aircarrier water survival A82-44291

DRAG
Effects of canopy geometry and cloth permeability on the drag coefficient of a cross parachute in the fully open and reefed conditions for a W/A ratio of 0.3 [AD-A115046] N82-30293
Kevlar/PMR-15 reduced drag DC-9 reverser stang fairing [NASA-CR-165448] N82-31448

DRAG REDUCTION
Taking the drag out of bombs A82-42849
Reduction in parachute drag due to forebody wake effects [DE81-030124] N82-31309

DROPS (LIQUIDS)
The interaction of radio frequency electromagnetic fields with atmospheric water droplets and applications to aircraft ice prevention [NASA-CR-169246] N82-30432

DURABILITY
Titanium surface treatments for adhesive bonding [AD-A114710] N82-30378

DYNAMIC LOADS
Experimental investigation of active loads control for aircraft landing gear [NASA-TP-2042] N82-31321
Aerodynamic forces acting on the blades of stall regulated propeller type windmills [DE82-901178] N82-31718

DYNAMIC MODELS
Pneumatic tire model for aircraft simulation A82-44244

DYNAMIC STRUCTURAL ANALYSIS
An examination of the dynamics of rotary machines --- French thesis A82-43724
Hybrid state vector methods for structural dynamic and aeroelastic boundary value problems [NASA-CR-3591] N82-31304

E

ECONOMIC ANALYSIS
Economic analysis for data base management A82-42208

ECONOMIC FACTORS
Aeronautical research and development in Europe - Perspectives A82-43588
Noise and economic characteristics of an advanced blended supersonic transport concept [NASA-TP-2073] N82-31294

ECONOMIC IMPACT
Kevlar/PMR-15 reduced drag DC-9 reverser stang fairing [NASA-CR-165448] N82-31448

EDUCATION
High-altitude imagery user guide [PB82-158353] N82-30608

EJECTION INJURIES
Problems with the use of percentages in the analysis of AAES data --- Aircrew Automated Escape Systems A82-44293

ELASTOMERS
Studies of new perfluoroether elastomeric sealants --- for aircraft fuel tanks [NASA-CR-166377] N82-30400

ELECTRIC CONTROL
Theoretical and experimental investigation of some nonlinear characteristics of electrohydraulic servovalves --- German thesis A82-43660

ELECTRICAL PROPERTIES
Notebook on electromagnetic properties of composite materials below 1 GHz [AD-A115132] N82-30340

ELECTRO-OPTICS
A miniature electro-optical air flow sensor A82-41854

ELECTROMAGNETIC FIELDS
The interaction of radio frequency electromagnetic fields with atmospheric water droplets and applications to aircraft ice prevention [NASA-CR-169246] N82-30432

ELECTROMAGNETIC INTERACTIONS
The interaction of radio frequency electromagnetic fields with atmospheric water droplets and applications to aircraft ice prevention [NASA-CR-169246] N82-30432

ELECTROMAGNETIC PROPERTIES
Notebook on electromagnetic properties of composite materials below 1 GHz [AD-A115132] N82-30340

ELECTROMAGNETIC PULSES
Notebook on electromagnetic properties of composite materials below 1 GHz [AD-A115132] N82-30340

ELECTROMECHANICAL DEVICES
Electromechanical Actuation Development Program (EADP). Power control development [AD-A116126] N82-31694

ELECTRONIC CONTROL
Electronic aircraft stabilization [SEE PAPER 811763] A82-44234
Electromechanical Actuation Development Program (EADP). Power control development [AD-A116126] N82-31694

ELECTRONIC COUNTERMEASURES
Northrop ECM - From B-1B to F-5E A82-43425
The effect of radome scattering on ECM antenna patterns [AD-A115517] N82-30463

ELECTRONIC WARFARE
Hover jam - US Army studies EW helicopter A82-41888
Electronic warfare system measure of effectiveness A82-43840

ELLIPSOIDS
Near field analysis of airborne antennas [AD-A115074] N82-30462

EMBEDDING
Singularity embedding method in potential flow calculations [NASA-CR-166387] N82-31300

ENERGY CONSERVATION
Minimum fuel horizontal flight paths in the terminal area A82-44480

ENGINE DESIGN
Mathematical models of rotor strength and optimization in computer-aided design A82-42462
The Power Pair Locus - A preliminary design aid to select power ratings for multi-engined helicopters A82-42474
Piston engines for general aviation - Is the revolution really under way A82-43578
Development of a spinning wave heat engine [NASA-CR-165611] N82-31328

ENGINE NOISE
Airport/Community Noise [NASA-CP-2241] N82-31070
Airport noise N82-31071
Rough analysis of installation effects on turboprop noise [NASA-TM-82924] N82-32082

NASA SP-7037(155)

AERONAUTICAL ENGINEERING

A CONTINUING BIBLIOGRAPHY WITH INDEXES

(Supplement 155)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in November 1982 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

NASA Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

ENGINE PARTS
  Structural strength of materials and parts of gas turbine engines --- Russian book
    A82-42063
  Improved penetrant process evaluation criteria
    [AD-A115157] N82-30386
ENGINE TESTS
  Acoustic emission inspection of aircraft engine turbine blades for intergranular corrosion
    A82-41914
ENVIRONMENT EFFECTS
  The noise impact of proposed runway alternatives at Craig Airport
    [NASA-TM-84503] N82-32080
ESCAPE SYSTEMS
  Problems with the use of percentages in the analysis of AAES data --- Aircrew Automated Escape Systems
    A82-44293
ESTIMATES
  Real time estimation and prediction of ship motions using Kalman filtering techniques
    [NASA-CR-169284] N82-31637
  A description of methodologies used in estimation of a A-weighted sound levels for FAA Advisory circular AC-36-3B
    [AD-A116543] N82-32084
ETHERS
  Studies of new perfluoroether elastomeric sealants --- for aircraft fuel tanks
    [NASA-CR-166377] N82-30400
EULER EQUATIONS OF MOTION
  An implicit finite-volume method for solving the euler equations
    [ONERA, TP NO. 1982-39] A82-43753
  Damped Euler-equation method to compute transonic flow around wing-body combinations
    A82-44092
EUROPEAN AIRBUS
  Europe's best seller - Second-generation Airbus emerges
    A82-42750
  Airbus A 310 will compete with Boeing 767 for market
    N82-32300
EUTECTIC COMPOSITES
  High temperature composites. Status and future directions
    [NASA-TM-82929] N82-30336
EXHAUST GASES
  Remote sensing of turbine engine gases
    [AD-A115443] N82-30310
  An investigation of the effects of smoke suppressant fuel additives on engine and test cell exhaust gas opacities
    [AD-A116171] N82-31548
EXHAUST NOZZLES
  Axisymmetric and non-axisymmetric exhaust jet induced effects on a V/STOL vehicle design. Part 2: Analysis of results
    [NASA-CR-166365] N82-31301
  Axisymmetric and non-axisymmetric exhaust jet induced effects on a V/STOL vehicle design. Part 3: Experimental technique
    [NASA-CR-166147] N82-31302
EXTERNAL STORES
  Taking the drag out of bombs
    A82-42849

F

F-4 AIRCRAFT
  Implicit model-following technique - Application to the design of longitudinal stability augmentation systems
    A82-43571
  Aerodynamics on a transport aircraft type wing-body model
    [NASA-TM-76878] N82-30287
F-15 AIRCRAFT
  New nozzle design aimed at F-15, F-16 aircraft
    A82-43092
F-16 AIRCRAFT
  F-16 Centralized Data System /CDS/
    A82-42206
  New nozzle design aimed at F-15, F-16 aircraft
    A82-43092
F-18 AIRCRAFT
  F/A-18 Hornet reliability challenge - Status report
    A82-42229
  Aeropropulsive characteristics of Mach numbers up to 2.2 of axisymmetric and nonaxisymmetric nozzles installed on an F-18 model
    [NASA-TP-2044] N82-30291
FABRICATION
  Materials and design criteria for Kevlar-29 ribbon parachutes
    [AD-A116357] N82-31308
FAIL-SAFE SYSTEMS
  Analysis of built-in-test accuracy
    A82-42211
FAILURE ANALYSIS
  Maximum likelihood failure detection of aircraft flight control sensors
    A82-44481
FAILURE MODES
  F/A-18 Hornet reliability challenge - Status report
    A82-42229
FAIRINGS
  Flow control for a high energy laser turret using trapped vortices
    [AD-A115263] N82-30547
FATIGUE (MATERIALS)
  Improved penetrant process evaluation criteria
    [AD-A115157] N82-30386
  Stress intensity factors for radial cracks at outer surface of a partially autofrettaged cylinder subjected to internal pressure
    [AD-A116396] N82-31714
FATIGUE LIFE
  A fatigue crack growth theory based on strain energy density factor
    A82-43742
FATIGUE TESTS
  Structural strength of materials and parts of gas turbine engines --- Russian book
    A82-42063
FATTY ACIDS
  Antiwear properties of additives based on higher fatty acids --- for jet fuels
    A82-42893
FAULT TOLERANCE
  Advanced reliability modeling of fault-tolerant computer-based systems
    [NASA-TM-84501] N82-30962
FAULT TREES
  Fault isolation BITE for increased productivity
    A82-42210
FEEDBACK CONTROL
  Optimisation in multivariable design
    A82-42565
FERROGRAPHY
  Application of wear debris analysis to aircraft hydraulic systems
    [AD-A115060] N82-30305
FIBER OPTICS
  Fiber optics remoting of terminal radar and beacon signals
    [AD-A116403] N82-32140
FIBER REINFORCED COMPOSITES
  High temperature composites. Status and future directions
    [NASA-TM-82929] N82-30336
FIGHTER AIRCRAFT
  A supersonic V/STOL fighter design project
    A82-42545
  Taking the drag out of bombs
    A32-42849
  New approaches to fighter design
    A82-44218
  New technologies for future fighters
    A82-44219
  Mediating Mach's mechanics - Bombs away --- weapons delivery of fighter aircraft at transonic speed
    A82-44467
  Assessment of stereographics for fire control and navigation in fighter aircraft
    [AD-A115414] N82-30306
  Supercritical maneuvering fighter configuration. Wind-tunnel investigation at Mach numbers of 0.60 to 0.95
    [NASA-TM-84513] N82-31303
FINANCIAL MANAGEMENT
  The sporty game --- on wide body commercial airliner business history
    A82-42572

FINITE ELEMENT METHOD
An examination of the dynamics of rotary machines --- French thesis
A82-43724
Large displacements and stability analysis of nonlinear propeller structures
[NASA-TM-82850] N82-31707
Stress intensity factors for radial cracks at outer surface of a partially autofrettaged cylinder subjected to internal pressure
[AD-A116396] N82-31714
FINITE VOLUME METHOD
An implicit finite-volume method for solving the euler equations
[ONERA, TP NO. 1982-59] A82-43753
Damped Euler-equation method to compute transonic flow around wing-body combinations
A82-44092
FLIGHT CHARACTERISTICS
Characteristics of a Paris-New York flight on board the Concorde
A82-41700
FLIGHT CONDITIONS
Meteorological aspects of North Atlantic flight tracks - Some interim results of the study
A82-43250
Aerodynamic penalties of heavy rain on a landing aircraft
[NASA-CR-156885] N82-30298
FLIGHT CONTROL
Statistical analysis of piloted simulation of real time trajectory optimization algorithms
A82-43261
Current perspectives on emergency spin-recovery systems
A82-43264
757 systems key to route flexibility
A82-43275
Image processing in tactical flight guidance
A82-44221
Maximum likelihood failure detection of aircraft flight control sensors
A82-44481
Evaluation of a trajectory command concept for manual control of carrier approaches and landings
N82-30856
Singular perturbation techniques for real time aircraft trajectory optimization and control
[NASA-CR-3597] N82-31330
Design of advanced digital flight control systems via Command Generator Tracker (CGT) synthesis methods, volume 1
[AD-A115510] N82-31331
Design of advanced digital flight control systems via Command Generator Tracker (CGT) synthesis methods, volume 2
[AD-A115511] N82-31332
FLIGHT FATIGUE
Human-factors evaluation of C-141 fuel savings advisory system
[AD-A114931] N82-30304
FLIGHT MECHANICS
Applied flight mechanics in the design and in flight tests
A82-43327
FLIGHT OPERATIONS
Processes and procedural approaches used in the dimensioning of the supporting structure and the demonstration of the airworthiness
A82-43331
FLIGHT OPTIMIZATION
The flight management computer
[SEE PAPER 811762] A82-44233
FLIGHT PATHS
Meteorological aspects of North Atlantic flight tracks - The development of programs for minimum-time tracks
A82-43249
Meteorological aspects of North Atlantic flight tracks - Some interim results of the study
A82-43250
Loran-C navigation as an aid to aerial photographic operations
A82-43469
The aviation route forecast /ARF/ program - An interactive system for pilot self-briefing --- of meteorological information
A82-43821
Automated flight data processing
A82-44222
Minimum fuel horizontal flight paths in the terminal area
N82-30080
Optimal periodic dolphin gliding flight
N82-30313
FLIGHT PLANS
Meteorological aspects of North Atlantic flight tracks - The development of programs for minimum-time tracks
A82-43249
Meteorological aspects of North Atlantic flight tracks - Some interim results of the study
A82-43250
FLIGHT SIMULATION
Design, simulation and evaluation of advanced display concepts for the F-16 control configured vehicle
N82-30059
Separation monitoring with four types of predictors on a cockpit display of traffic information
N82-30060
FLIGHT SIMULATORS
Analysis and preparation of a digital terrain data base for flight simulator use
[AD-A115547] N82-30315
Computer architecture study for VTXTS simulators
[AD-A115806] N82-30953
Wide-angle, multiviewer, infinity display system
[AD-A116308] N82-31336
FLIGHT TEST INSTRUMENTS
Integrated sensor system for flight test instrumentation
A82-41869
FLIGHT TESTS
Analysis of flight data in the frequency domain
A82-41796
Europe's best seller - Second-generation Airbus emerges
A82-42750
The testing of new technologies with the aid of the Alpha Jet aircraft
A82-43326
Applied flight mechanics in the design and in flight tests
A82-43327
Methodology in flight tests
A82-43400
New technologies for future fighters
A82-44219
XV-15 program update
A82-44468
Grob aircraft construction: The G 110 flies
[NASA-TM-76893] N82-30303
FLIGHT TIME
Meteorological aspects of North Atlantic flight tracks - The development of programs for minimum-time tracks
A82-43249
FLOATING POINT ARITHMETIC
A floating-point/multiple-precision processor for airborne applications
A82-41868
FLOW CHARACTERISTICS
Flow and acoustic properties of low Reynolds number underexpanded supersonic jets
[NASA-CR-169257] N82-30280
FLOW DISTORTION
A method for designing inlet distortion screens for aircraft gas turbine engine tests using an interactive computer program
[AD-A116584] N82-31325
FLOW DISTRIBUTION
Flow and pressure field of a model propeller
[NASA-TM-76690] N82-30290
A prescribed wake rotor inflow and flow field prediction analysis, user's manual and technical approach
[NASA-CR-165894] N82-31286
Surface generation for aerodynamic applications
[AD-A116263] N82-31305
Development and utilization of a laser velocimeter system for a large transonic wind tunnel
[NASA-TM-82886] N82-31663

TRANSONIC FLOW
An implicit finite-volume method for solving the euler equations [ONERA, TP NO. 1982-59] A82-43753
Damped Euler-equation method to compute transonic flow around wing-body combinations A82-44092
The design of airfoil profiles with trailing edge loading in transonic flow --- French thesis A82-44224

TRANSONIC FLUTTER
An experimental examination of compressor blade flutter [ONERA, TP NO. 1982-31] A82-42808
Transonic flutter and response analyses of two 3-degree-of-freedom airfoils A82-44245

TRANSONIC SPEED
Transient phenomena of shock-induced turbulent separation for a spikebody and stalling airfoil at transonic and supersonic speeds [AIAA PAPER 82-1362] A82-42950

TRANSONIC WIND TUNNELS
Adaptation and first cryogenic operation of T2 ONERA/CERT wind tunnel A82-42531
Bonding procedure for Teflon seals A82-42792
Corrections for wall effects in ONERA industrial wind tunnels [ONERA, TP NO. 1982-34] A82-42810
Application of laser velocimetry to large industrial wind-tunnels [ONERA, TP NO. 1982-63] A82-43757
Wind tunnel investigations on thin supercritical airfoils in high subsonic flow [DFVLR-FB-82-06] N82-30296
Control software for two dimensional airfoil tests using a self-streamlining flexible walled transonic test section [NASA-CR-165941] N82-30314
Development and utilization of a laser velocimeter system for a large transonic wind tunnel [NASA-TM-82886] N82-31663

TRANSPORT AIRCRAFT
Aircraft R&D in Europe - A perspective view A82-42544
Aerodynamics on a transport aircraft type wing-body model [NASA-TM-76878] N82-30287

TRANSPORT PROPERTIES
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 1: Properties in SI units [NASA-TP-1906] N82-32186
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 2: Compositions corresponding to Kelvin temperature schedules in part 1 [NASA-TP-1907] N82-32187
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 3: Properties in US customary units [NASA-TP-1908] N82-32188
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 4: Compositions corresponding to Rankine temperature schedules in part 3 [NASA-TP-1909] N82-32189

TRIBOLOGY
Application of wear debris analysis to aircraft hydraulic systems [AD-A115060] N82-30305

TURBINE BLADES
Acoustic emission inspection of aircraft engine turbine blades for intergranular corrosion A82-41914
Mathematical models of rotor strength and optimization in computer-aided design A82-42462

TURBINE ENGINES
Remote sensing of turbine engine gases [AD-A115443] N82-30310

TURBINE WHEELS
An examination of the dynamics of rotary machines --- French thesis A82-43724

TURBOCOMPRESSORS
An experimental examination of compressor blade flutter [ONERA, TP NO. 1982-31] A82-42808

TURBOFAN ENGINES
A preliminary analysis of TF34-100/400 jet engine rework data in support of the MRP system implementation at NARF Alameda [AD-A114452] N82-30308
Rough analysis of installation effects on turboprop noise [NASA-TM-82924] N82-32082

TURBOJET ENGINES
Environmental and High-Strain Rate effects on composites for engine applications [NASA-TM-82882] N82-31449
An investigation of the effects of smoke suppressant fuel additives on engine and test cell exhaust gas opacities [AD-A116171] N82-31548

TURBOMACHINE BLADES
An examination of the dynamics of rotary machines --- French thesis A82-43724
Aerodynamic forces acting on the blades of stall regulated propeller type windmills [DE82-901178] N82-31718

TURBOMACHINERY
An examination of the dynamics of rotary machines --- French thesis A82-43724

TURBOPROP ENGINES
Rough analysis of installation effects on turboprop noise [NASA-TM-82924] N82-32082

TURBULENCE
The lateral response of an airship to turbulence [AD-A115197] N82-30312

TURBULENT FLOW
Turbulence modelling - Report of a Working Party A82-42547
Transient phenomena of shock-induced turbulent separation for a spikebody and stalling airfoil at transonic and supersonic speeds [AIAA PAPER 82-1362] A82-42950
Experimental study of turbulence in blade end wall corner region [NASA-CR-169283] N82-31639

TURNING FLIGHT
Minimum-time three-dimensional turn to a point of supersonic aircraft A82-44482

TWO DIMENSIONAL FLOW
The use of adaptive walls in plane flows [ONERA, TP NO. 1982-38] A82-42813

U

UPPER SURFACE BLOWING
Parietal jets. I --- upper surface blowing A82-43589

USER MANUALS (COMPUTER PROGRAMS)
User's manual for the Automated Paneling Technique (APT) and the Wing Body Aerodynamic Technique (WABAT) programs [NASA-CR-165895] N82-31297
Aeroelastic analysis for helicopter rotors with blade appended pendulum vibration absorbers. Mathematical derivations and program user's manual [NASA-CR-165896] N82-31298
Coupled rotor/airframe vibration analysis program manual manual. Volume 1: User's and programmer's instructions [NASA-CR-165891] N82-31965
Dynamic System Coupling (DYSCO) program. Volume 2: Theoretical manual [AD-A115004] N82-31975

USER REQUIREMENTS
Identification of terms to define unconstrained air transportation demands [NASA-CR-165961] N82-31311

V

V/STOL AIRCRAFT
A supersonic V/STOL fighter design project A82-42545

It's too logical - It'll never work /Commercial applications of the JVX/
A82-44469
Axisymmetric and non-axisymmetric exhaust jet induced effects on a V/STOL vehicle design. Part 2: Analysis of results
[NASA-CR-166365] N82-31301
Axisymmetric and non-axisymmetric exhaust jet induced effects on a V/STOL vehicle design. Part 3: Experimental technique
[NASA-CR-166147] N82-31302
Real time estimation and prediction of ship motions using Kalman filtering techniques
[NASA-CR-169284] N82-31637

VELOCITY DISTRIBUTION
Development and utilization of a laser velocimeter system for a large transonic wind tunnel
[NASA-TM-82886] N82-31663

VELOCITY MEASUREMENT
Development and utilization of a laser velocimeter system for a large transonic wind tunnel
[NASA-TM-82886] N82-31663

VERY HIGH FREQUENCIES
Combined amplitude-phase modulation for a VHF communication link
A82-43870

VERY LOW FREQUENCIES
Long-range radio NAVAID signal reliability
A82-41951

VIBRATION
Aeroelastic analysis for helicopter rotors with blade appended pendulum vibration absorbers. Mathematical derivations and program user's manual
[NASA-CR-165896] N82-31298
Coupled rotor/airframe vibration analysis program manual manual. Volume 1: User's and programmer's instructions
[NASA-CR-165891] N82-31965
Coupled rotor/airframe vibration analysis program manual. Volume 2: Sample input and output listings
[NASA-CR-165892] N82-31966

VIBRATION DAMPING
An experimental examination of compressor blade flutter
[ONERA, TP NO. 1982-31] A82-42808

VIBRATION EFFECTS
A doublet lattice method for the determination of rotor induced empennage vibration airloads. Analysis description and program documentation
[NASA-CR-165893] N82-31295
Activities of the Institute of Sound and Vibration Research
N82-31569

VIBRATION TESTS
An experimental examination of compressor blade flutter
[ONERA, TP NO. 1982-31] A82-42808

VIBRATORY LOADS
Experimental investigation of active loads control for aircraft landing gear
[NASA-TP-2042] N82-31321

VIDEO EQUIPMENT
Fiber optics remoting of terminal radar and beacon signals
[AD-A116403] N82-32140

VISCOUS FLOW
Aerodynamics on a transport aircraft type wing-body model
[NASA-TM-76878] N82-30287

VOICE COMMUNICATION
Combined amplitude-phase modulation for a VHF communication link
A82-43870

VORTICES
Aerosound from corner flow and flap flow
[NASA-CR-166396] N82-32081

W

WALL FLOW
Corrections for wall affects in ONERA industrial wind tunnels
[ONERA, TP NO. 1982-34] A82-42810
Higher-order flow angle corrections for three-dimensional wind tunnel wall interference
A82-44246

WALL PRESSURE
Experimental study of turbulence in blade end wall corner region
[NASA-CR-169283] N82-31639

WARNING SYSTEMS
Analysis of Active BCAS alert rates and protection based on actual aircraft tracks
[AD-A116402] N82-31319

WAVE PROPAGATION
Construction and testing of an Omega navigation system for the balloon-borne X-ray experiment --- German thesis
A82-43111
Notebook on electromagnetic properties of composite materials below 1 GHz
[AD-A115132] N82-30340

WAVE SCATTERING
The effect of radome scattering on ECM antenna patterns
[AD-A115517] N82-30463

WEAPON SYSTEMS
Taking the drag out of bombs
A82-42049
New approaches to fighter design
A82-44210
Final engineering report for computer, weapon aiming CP-1444/A
[AD-A115238] N82-31327

WEAPONS DELIVERY
Mediating Mach's mechanics - Bombs away --- weapons delivery of fighter aircraft at transonic speed
A82-44467
Final engineering report for computer, weapon aiming CP-1444/A
[AD-A115238] N82-31327

WEAR
Application of wear debris analysis to aircraft hydraulic systems
[AD-A115060] N82-30305

WEAR INHIBITORS
Antiwear properties of additives based on higher fatty acids --- for jet fuels
A82-42893
Life enhancement of Naval systems through advanced materials
[AD-A114722] N82-30404

WEATHER
Field program operations: Turbulence and gust front
[AD-A115447] N82-30804

WEATHER FORECASTING
The aviation route forecast /ARF/ program - An interactive system for pilot self-briefing --- of meteorological information
A82-43821
Evaluation of the FAA/MITRE weather data device
[AD-A114646] N82-30800

WEIGHT INDICATORS
The external balance system of the German-Dutch windtunnel DNW and its strain gage load cells
A82-43184

WHISKER COMPOSITES
High temperature composites. Status and future directions
[NASA-TM-82929] N82-30336

WIND PRESSURE
Aerodynamic forces acting on the blades of stall regulated propeller type windmills
[DE82-901178] N82-31718

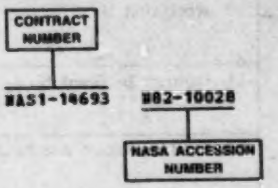
WIND TUNNEL APPARATUS
The external balance system of the German-Dutch windtunnel DNW and its strain gage load cells
A82-43184
A laser-interferometer method for determining the forces on a freely-flying model in a shock-tunnel
A82-43311
Application of laser velocimetry to large industrial wind-tunnels
[ONERA, TP NO. 1982-63] A82-43757

WIND TUNNEL CALIBRATION
Calibration and performance of the AEDC/VKF tunnel C, Mach number 4, aerothermal wind tunnel
[AD-A116279] N82-31338

WIND TUNNEL TESTS
Programmable controller system for wind tunnel diversion vanes
A82-41846
The use of adaptive walls in plane flows
[ONERA, TP NO. 1982-38] A82-42813

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

FLOW GEOMETRY
Optimal stream surfaces in supersonic three-dimensional flows A82-42722
Higher-order flow angle corrections for three-dimensional wind tunnel wall interference A82-44246
FLOW MEASUREMENT
Boundary layer transducers /DCL/ developed for the study of the flow over helicopter rotor blades [ONERA, TP NO. 1981-94] A82-42817
Laser Doppler anemometry applied to the study of the airflow in the wake of an helicopter rotor [ONERA, TP NO. 1982-61] A82-43755
Preliminary experiments on a centrifugal research compressor using a laser -2- focus velocimeter [ONERA, TP NO. 1982-62] A82-43756
Application of laser velocimetry to large industrial wind-tunnels [ONERA, TP NO. 1982-63] A82-43757
FLOW THEORY
Modern compressible flow with historical perspective --- Book A82-42552
FLOW VELOCITY
Preliminary experiments on a centrifugal research compressor using a laser -2- focus velocimeter [ONERA, TP NO. 1982-62] A82-43756
FLOWMETERS
A miniature electro-optical air flow sensor A82-41854
FLUORESCENCE
Improved penetrant process evaluation criteria [AD-A115157] N82-30386
FLUTTER ANALYSIS
An experimental examination of compressor blade flutter [ONERA, TP NO. 1982-31] A82-42808
Sensitivity analysis and optimization of aeroelastic stability A82-43394
Methodology in flight tests A82-43400
Transonic flutter and response analyses of two 3-degree-of-freedom airfoils A82-44245
FLYING PLATFORMS
Hover jam - US Army studies EW helicopter A82-41888
Perspectives for the use of remotely piloted vehicles in military technology A82-44220
FOIL BEARINGS
Gas foil bearing development program [AD-A114692] N82-30556
FOREBODIES
Reduction in parachute drag due to forebody wake effects [DE81-030124] N82-31309
FORTRAN
Design of advanced digital flight control systems via Command Generator Tracker (CGT) synthesis methods, volume 2 [AD-A115511] N82-31332
FRACTURE MECHANICS
A fatigue crack growth theory based on strain energy density factor A82-43742
FREE FLIGHT TEST APPARATUS
A laser-interferometer method for determining the forces on a freely-flying model in a shock-tunnel A82-43311
FREQUENCY RESPONSE
Optimisation in multivariable design A82-42565
FUEL CONSUMPTION
Minimum fuel horizontal flight paths in the terminal area A82-44480
Human-factors evaluation of C-141 fuel savings advisory system [AD-A114931] N82-30304
FUEL TANKS
Additional experiments on flowability improvements of aviation fuels at low temperatures, volume 2 [NASA-CR-167912] N82-31546
FUSELAGES
An optimum design of fuselage structure A82-42533

Generation of boundary-conforming grids around wing-body configurations using transfinite interpolation A82-44091

G

GAS BEARINGS
Gas foil bearing development program [AD-A114692] N82-30556
GAS TURBINE ENGINES
The analysis of the thermal-mechanical stress conditions in axisymmetric rotating hot components of /aircraft/ gas turbines --- German thesis A82-41686
Structural strength of materials and parts of gas turbine engines --- Russian book A82-42063
Ceramic applications in turbine engines [NASA-CR-165197] N82-31158
A method for designing inlet distortion screens for aircraft gas turbine engine tests using an interactive computer program [AD-A116584] N82-31325
GAS TURBINES
Oxidation-resistant materials for hot-gas turbines and jet engines A82-41725
GENERAL AVIATION AIRCRAFT
Analysis of flight data in the frequency domain A82-41796
Technology for tomorrow's business aircraft A82-43577
Piston engines for general aviation - Is the revolution really under way A82-43578
NASA studies business aircraft avionics A82-43659
Data acquisition system for NASA LaRC impact dynamics research facility [NASA-TM-84510] N82-30525
Structures and Dynamics Division research and technology plans, FY 1982 [NASA-TM-84509] N82-30566
GEODESIC LINES
Near field analysis of airborne antennas [AD-A115074] N82-30462
GEOSYNCLINES
A survey of melting layer research [AD-A115224] N82-30806
GLIDERS
Grob aircraft construction: The G 110 flies [NASA-TM-76893] N82-30303
Optimal periodic Dolphin gliding flight N82-30313
GLIDING
Optimal periodic Dolphin gliding flight N82-30313
GROUND SUPPORT EQUIPMENT
The ILS in Category III operations --- ground-based support for French air routes [SEE PAPER 811761] A82-44232
GROUND TRACKS
Meteorological aspects of North Atlantic flight tracks - The development of programs for minimum-time tracks A82-43249
Meteorological aspects of North Atlantic flight tracks - Some interim results of the study A82-43250
GUIDANCE (MOTION)
Image processing in tactical flight guidance A82-44221

H

HEAD-UP DISPLAYS
Final engineering report for computer, weapon aiming CP-1444/A [AD-A115238] N82-31327
HEAT RESISTANT ALLOYS
Oxidation-resistant materials for hot-gas turbines and jet engines A82-41725
High temperature composites. Status and future directions [NASA-TM-82929] N82-30336

HEATING EQUIPMENT
Additional experiments on flowability improvements of aviation fuels at low temperatures, volume 2
[NASA-CR-167912] N82-31546
HELICOPTER CONTROL
A restrained model helicopter, which is able to fly, for investigations regarding human multiparameter control behavior --- German thesis
A82-41687
HELICOPTER DESIGN
An examination of helicopter blade profiles and tips
[ONERA, TP NO. 1982-33] A82-42811
Apache to provide night/bad weather capability
A82-43091
User's manual for the coupled rotor/airframe vibration analysis graphic package
[NASA-CR-165897] N82-31299
HELICOPTER ENGINES
The Power Pair Locus - A preliminary design aid to select power ratings for multi-engined helicopters
A82-42478
Helicopter noise definition report UH-60A, S-76, A-109, 206-L
[AD-A116363] N82-32083
HELICOPTER PERFORMANCE
Boundary layer transducers /DCL/ developed for the study of the flow over helicopter rotor blades
[ONERA, TP NO. 1981-93] A82-42817
Apache to provide night/bad weather capability
A82-43091
Helicopter commuters - An optimistic outlook
A82-44470
Coupled rotor/airframe vibration analysis program manual manual. Volume 1: User's and programmer's instructions
[NASA-CR-165891] N82-31965
Coupled rotor/airframe vibration analysis program manual. Volume 2: Sample input and output listings
[NASA-CR-165892] N82-31966
HELICOPTER WAKES
Laser Doppler anemometry applied to the study of the airflow in the wake of an helicopter rotor
[ONERA, TP NO. 1982-61] A82-43755
A prescribed wake rotor inflow and flow field prediction analysis, user's manual and technical approach
[NASA-CR-165894] N82-31296
HELICOPTERS
Flight trials of the Litton LTN-211 Omega Navigation System in a Wessex helicopter
[RAE-TM-RAD-NAV-107] N82-30299
Pilot/vehicle model analysis of visual and motion cue requirements in flight simulation
N82-30838
Dynamic System Coupling (DYSCO) program. Volume 2: Theoretical manual
[AD-A115004] N82-31975
Helicopter noise definition report UH-60A, S-76, A-109, 206-L
[AD-A116363] N82-32083
HELMET MOUNTED DISPLAYS
Assessment of stereographics for fire control and navigation in fighter aircraft
[AD-A115414] N82-30306
HIGH ALTITUDE
High-altitude imagery user guide
[PB82-158353] N82-30608
HIGH POWER LASERS
Flow control for a high energy laser turret using trapped vortices
[AD-A115263] N82-30547
HIGH TEMPERATURE GASES
Oxidation-resistant materials for hot-gas turbines and jet engines
A82-41725
Modern compressible flow with historical perspective --- Book
A82-42552
HISTORIES
Composite materials: Tomorrow for the day after tomorrow
[NASA-TM-76700] N82-30337
HORIZONTAL FLIGHT
Minimum fuel horizontal flight paths in the terminal area
A82-44480
HOVERING
A restrained model helicopter, which is able to fly, for investigations regarding human multiparameter control behavior --- German thesis
A82-41687
HUMAN FACTORS ENGINEERING
Human-factors evaluation of C-141 fuel savings advisory system
[AD-A114931] N82-30304
HYDRAULIC CONTROL
Theoretical and experimental investigation of some nonlinear characteristics of electrohydraulic servovalves --- German thesis
A82-41640
Experimental investigation of active loads control for aircraft landing gear
[NASA-TP-2042] N82-31321
HYDRAULIC EQUIPMENT
Application of wear debris analysis to aircraft hydraulic systems
[AD-A115060] N82-30305
HYDROCARBON COMBUSTION
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 1: Properties in SI units
[NASA-TP-1906] N82-32106
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 2: Compositions corresponding to Kelvin temperature schedules in part 1
[NASA-TP-1907] N82-32107
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 3: Properties in US customary units
[NASA-TP-1908] N82-32108
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 4: Compositions corresponding to Rankine temperature schedules in part 3
[NASA-TP-1909] N82-32109
HYDROCARBON FUELS
Additional experiments on flowability improvements of aviation fuels at low temperatures, volume 2
[NASA-CR-167912] N82-31546
HYPERSONIC SPEED
What has hypersonics research led to - Some examples of progress and spin off /17th Lanchester Page Memorial lecture/
A82-43583
HYPERSONICS
What has hypersonics research led to - Some examples of progress and spin off /17th Lanchester Page Memorial lecture/
A82-43583

I

ICE FORMATION
Aircraft icing research at NASA
[NASA-TM-82919] N82-30297
Study of the de-icing properties of the ASDE-3 rotodome
[AD-A115445] N82-31335
ICE PREVENTION
Aircraft icing research at NASA
[NASA-TM-82919] N82-30297
A survey of melting layer research
[AD-A115224] N82-30996
ILYUSHIN AIRCRAFT
Proposed multipurpose flying radio-physical laboratory using an IL-18 aircraft
A82-43270
IMAGE PROCESSING
Image processing in tactical flight guidance
A82-44221
Wide-angle, multiviewer, infinity display system
[AD-A116308] N82-31336
IMAGERY
Analysis and preparation of a digital terrain data base for flight simulator use
[AD-A115547] N82-30315
IMAGING TECHNIQUES
High-altitude imagery user guide
[PB82-158353] N82-30608
IMPACT RESISTANCE
Environmental and High-Strain Rate effects on composites for engine applications
[NASA-TM-82882] N82-31389

Processes and procedural approaches in the aerodynamic design of the Alpha Jet aircraft A82-43328
The design of airfoil profiles with trailing edge loading in transonic flow --- French thesis A82-44224
Wind tunnel investigations on thin supercritical airfoils in high subsonic flow [DFVLR-FB-82-06] N82-30296
Supercritical maneuvering fighter configuration. Wind-tunnel investigation at Mach numbers of 0.60 to 0.95 [NASA-TM-84513] N82-31303

WIND TUNNEL WALLS
Corrections for wall effects in ONERA industrial wind tunnels [ONERA, TP NO. 1982-34] A82-42810
The use of adaptive walls in plane flows [ONERA, TP NO. 1982-38] A82-42813
Higher-order flow angle corrections for three-dimensional wind tunnel wall interference A82-44246

WIND TURBINES
Aerodynamic forces acting on the blades of stall regulated propeller type windmills [DE82-901178] N82-31718

WIND VANES
Programmable controller system for wind tunnel diversion vanes A82-41846

WING FLAPS
Aerosound from corner flow and flap flow [NASA-CR-166396] N82-32081

WING LOADING
The design of airfoil profiles with trailing edge loading in transonic flow --- French thesis A82-44224

WING OSCILLATIONS
Sensitivity analysis and optimization of aeroelastic stability A82-43394
Transonic flutter and response analyses of two 3-degree-of-freedom airfoils A82-44245

WING TIP VORTICES
Damped Euler-equation method to compute transonic flow around wing-body combinations A82-44092

WINGS
The application of geometric programming to the structural design of aircraft wings A82-42546
An effective algorithm for shock-free wing design [AD-A116265] N82-31322

WORKLOADS (PSYCHOPHYSIOLOGY)
Pilot/vehicle model analysis of visual and motion cue requirements in flight simulation N82-30838

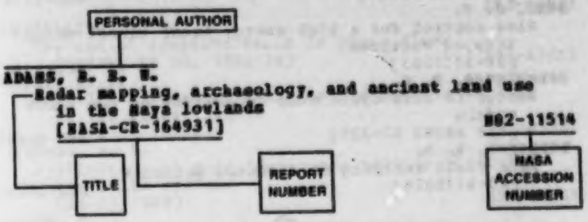
X

X RAY ASTRONOMY
Construction and testing of an Omega navigation system for the balloon-borne X-ray experiment --- German thesis A82-43111

XV-15 AIRCRAFT
XV-15 program update A82-44468

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

A

ABLIAZOV, V. S.
Proposed multipurpose flying radio-physical laboratory using an IL-18 aircraft
A82-43278

ADAMS, R. S.
Recent results in main beam nulling
A82-43792

AIELLO, R. A.
Large displacements and stability analysis of nonlinear propeller structures
[NASA-TM-82850] N82-31707

ANDERS, K. P.
Flow and pressure field of a model propeller
[NASA-TM-76690] N82-30290

ANDERSON, D. A.
NASA aeronautics
[NASA-EP-85] N82-30283

ANDERSON, J. D., JR.
Modern compressible flow with historical perspective
A82-42552

ANDERSON, R. E.
A method for designing inlet distortion screens for aircraft gas turbine engine tests using an interactive computer program

BABKOV, V. F.
Survey and design of airfields
A82-43603

BADALIANCE, R.
A fatigue crack growth theory based on strain energy density factor
A82-43742

BAILEY, D.
Electromechanical Actuation Development Program (EADP). Power control development
[AD-A116126] N82-31694

BAKER, B.
Computer architecture study for VTXTS simulators
[AD-A115006] N82-30953

BALASHOV, B. F.
Structural strength of materials and parts of gas turbine engines
A82-42063

BALES, K. S.
Structures and Dynamics Division research and technology plans, FY 1982
[NASA-TM-84509] N82-30566

BALLARD, R. E.
The Maneuverable Atmospheric Probe (MAP), a remotely piloted vehicle
[AD-A116118] N82-31323

BANDA, S. S.
Analysis of flight data in the frequency domain
A82-41796

BARANOV, P. I.
Extracts from Problems of Air Law, a collection of works of the Section of air law of the Aviakhim Society of the USSR and Aviakhim RSFSR
[NASA-TM-76913] N82-31153

BARNES, A. A., JR.
A survey of melting layer research
[AD-A115224] N82-30806

BARON, S.
Pilot/vehicle model analysis of visual and motion cue requirements in flight simulation
N82-30838

BARRINGER, S. R.
Bonding procedure for Teflon seals
A82-42792

BARTHOLOMEW, P.
The application of geometric programming to the structural design of aircraft wings
A82-42546

BASIULIS, D. I.
Studies of new perfluoroether elastomeric sealants
[NASA-CR-166377] N82-30400

BATTEN, F. E.
Data acquisition system for NASA LaRC impact dynamics research facility
[NASA-TM-84510] N82-30525

BAVUSO, S. J.
Advanced reliability modeling of fault-tolerant computer-based systems
[NASA-TM-84501] N82-30962

BELABUS, R.
Electromechanical Actuation Development Program (EADP). Power control development
[AD-A116126] N82-31694

BELCHER, W. R.
R & M characteristics of a Microwave Landing System
A82-42216

BELIUNOV, A. M.
Proposed multipurpose flying radio-physical laboratory using an IL-18 aircraft
A82-43278

IN-FLIGHT MONITORING
In-flight acoustic emission monitoring A82-42865

INCOMPRESSIBLE FLOW
Aerosound from corner flow and flap flow [NASA-CR-166396] N82-32081

INFORMATION SYSTEMS
The aviation route forecast /ARF/ program - An interactive system for pilot self-briefing --- of meteorological information A82-43821

INPUT/OUTPUT ROUTINES
A floating-point/multiple-precision processor for airborne applications A82-41868

INSPECTION
Computer Monitored Inspection Program /CMIP/, a key to increased aircraft and personnel productivity A82-42217

INSTALLING
Rough analysis of installation effects on turboprop noise [NASA-TM-82924] N82-32082

INSTRUMENT LANDING SYSTEMS
Simulated ILS using a laser tracker A82-41795
The ILS in Category III operations --- ground-based support for French air routes [SEE PAPER 811761] A82-44232

INTAKE SYSTEMS
A method for designing inlet distortion screens for aircraft gas turbine engine tests using an interactive computer program [AD-A116584] N82-31325

INTERACTIVE CONTROL
Interactive graphics design with CODEM A82-44223

INTERGRANULAR CORROSION
Acoustic emission inspection of aircraft engine turbine blades for intergranular corrosion A82-41914

INTERNATIONAL COOPERATION
Consideration of an international private sector satellite search and rescue locating system [IAF PAPER 82-236] A82-44699

INTERPOLATION
Generation of boundary-conforming grids around wing-body configurations using transfinite interpolation A82-44091

INVENTORY CONTROLS
A preliminary analysis of TF34-100/400 jet engine rework data in support of the MRP system implementation at NARF Alameda [AD-A114452] N82-30308

INVISCID FLOW
Damped Euler-equation method to compute transonic flow around wing-body combinations A82-44092

J

JAMMING
Hover jam - US Army studies EW helicopter A82-41888
Northrop ECM - From B-1B to F-5E A82-43425

JET AIRCRAFT
In-flight acoustic emission monitoring A82-42865

JET AIRCRAFT NOISE
Flow and acoustic properties of low Reynolds number underexpanded supersonic jets [NASA-CR-169257] N82-30288
Airport/Community Noise [NASA-CP-2241] N82-31070
Airport noise N82-31071
Community noise N82-31072
Summary of airport technology needs N82-31073

JET ENGINE FUELS
Antiwear properties of additives based on higher fatty acids --- for jet fuels A82-42893
An investigation of the effects of smoke suppressant fuel additives on engine and test cell exhaust gas opacities [AD-A116171] N82-31548

JET ENGINES
Oxidation-resistant materials for hot-gas turbines and jet engines A82-41725
A description of methodologies used in estimation of A-weighted sound levels for FAA Advisory circular AC-36-3B [AD-A116543] N82-32084

JET EXHAUST
Axisymmetric and non-axisymmetric exhaust jet induced effects on a V/STOL vehicle design. Part 3: Experimental technique [NASA-CR-166147] N82-31302

JET FLOW
Parietal jets. I --- upper surface blowing A82-43569

JOURNAL BEARINGS
Gas foil bearing development program [AD-A114692] N82-30556

K

KALMAN FILTERS
Real time estimation and prediction of ship motions using Kalman filtering techniques [NASA-CR-169284] N82-31637

KEVLAR (TRADEMARK)
Materials and design criteria for Kevlar-29 ribbon parachutes [AD-A116357] N82-31308
Kevlar/PMR-15 reduced drag DC-9 reverser stang fairing [NASA-CR-165448] N82-31448

L

LABORATORY EQUIPMENT
Proposed multipurpose flying radio-physical laboratory using an IL-18 aircraft A82-43278

LAMINAR FLOW
Laminar flow control, 1976 - 1982: A selected annotated bibliography [NASA-TM-84496] N82-31645

LAND USE
Community noise N82-31072

LANDING GEAR
Experimental investigation of active loads control for aircraft landing gear [NASA-TP-2042] N82-31321
Description of a simple model to determine landing gear forces during the takeoff of aerodynamically unstable aircraft [EX-22B] N82-31333

LANDING SIMULATION
Design, simulation and evaluation of advanced display concepts for the F-16 control configured vehicle N82-30859
Real time estimation and prediction of ship motions using Kalman filtering techniques [NASA-CR-169284] N82-31637

LASER APPLICATIONS
Simulated ILS using a laser tracker A82-41795
Laser pointing in a turbulent atmosphere A82-42887
Development and utilization of a laser velocimeter system for a large transonic wind tunnel [NASA-TM-82886] N82-31663

LASER DOPPLER VELOCIMETERS
Laser Doppler anemometry applied to the study of the airflow in the wake of an helicopter rotor [ONERA, TP NO. 1982-61] A82-43755
Preliminary experiments on a centrifugal research compressor using a laser -2- focus velocimeter [ONERA, TP NO. 1982-62] A82-43756
Application of laser velocimetry to large industrial wind-tunnels [ONERA, TP NO. 1982-63] A82-43757

LASER INTERFEROMETRY
A laser-interferometer method for determining the forces on a freely-flying model in a shock-tunnel A82-43311

LATERAL STABILITY
Description of a simple model to determine landing gear forces during the takeoff of aerodynamically unstable aircraft
[RE-228] N82-31333
LATTICES (MATHEMATICS)
A doublet lattice method for the determination of rotor induced empennage vibration airloads. Analysis description and program documentation
[NASA-CR-165093] N82-31298
LAW (JURISPRUDENCE)
Summary of Federal Aviation Administration response to National Transportation Safety Board safety recommendations
[AD-A115405] N82-31313
LAYERS
A survey of melting layer research
[AD-A115224] N82-30806
LIFE (DURABILITY)
Life enhancement of Naval systems through advanced materials
[AD-A114722] N82-30404
LIFE CYCLE COSTS
Repair-discard concepts in design
A82-42178
R/M/LCC effects of commercial off-the-shelf equipment
A82-42181
Design to life cycle cost capability of the PRICE models
[IAF PAPER 82-221] A82-44695
LIFE RAFTS
Utilization of AN/APS-94 side-looking airborne radar systems in search and rescue
[AD-A114484] N82-30437
LIFT DRAG RATIO
An effective algorithm for shock-free wing design
[AD-A116265] N82-31322
LIGHT (VISIBLE RADIATION)
Airborne measurements of European sky and terrain radiances
[AD-A114637] N82-30782
LIQUEFACTION
A survey of melting layer research
[AD-A115224] N82-30806
LISTS
Coupled rotor/airframe vibration analysis program manual. Volume 2: Sample input and output listings
[NASA-CR-165092] N82-31566
LOADS (FORCES)
Pneumatic tire model for aircraft simulation
A82-44244
The lateral response of an airship to turbulence
[AD-A115197] N82-30312
Simulation of the interaction between airdrop platforms and aircraft rollers
[AD-A116370] N82-31328
LOGIC DESIGN
Design of advanced digital flight control systems via Command Generator Tracker (CGT) synthesis methods, volume 2
[AD-A115511] N82-31332
LOGISTICS
Design and implementation of USAF avionics integration support facilities
[AD-A115537] N82-30307
LONGITUDINAL STABILITY
Implicit model-following technique - Application to the design of longitudinal stability augmentation systems
A82-43571
LORAN C
Long-range radio NAVAIDS signal reliability
A82-41931
Loran-C navigation as an aid to aerial photographic operations
A82-43469
LOW TEMPERATURE
Additional experiments on flowability improvements of aviation fuels at low temperatures, volume 2
[NASA-CR-167912] N82-31586
LUBRICATING OILS
Determination of antioxidant content in aviation oils using thin-layer chromatography
A82-42898
Antioxidants for synthetic oils
A82-42895

M

MACH NUMBER
Aeropropulsive characteristics of Mach numbers up to 2.2 of axisymmetric and nonaxisymmetric nozzles installed on an F-18 model
[NASA-TP-2000] N82-30291
Calibration and performance of the AEDC/VKF tunnel C, Mach number 4, aerothermal wind tunnel
[AD-A115279] N82-31330
MAINTAINABILITY
Annual Reliability and Maintainability Symposium, Los Angeles, CA, January 26-28, 1982, Proceedings
A82-42176
R/M/LCC effects of commercial off-the-shelf equipment
A82-42181
R & M characteristics of a Microwave Landing System
A82-42216
MAINTENANCE
Repair and maintenance of buildings in civil aviation --- Russian book
A82-42033
MAN MACHINE SYSTEMS
A restrained model helicopter, which is able to fly, for investigations regarding human multiparameter control behavior --- German thesis
A82-41587
The aviation route forecast /ARF/ program - An interactive system for pilot self-briefing --- of meteorological information
A82-41821
Assessment of stereographics for fire control and navigation in fighter aircraft
[AD-A115416] N82-30306
Application of a pilot control strategy identification technique to a joint FAA/NASA ground based simulation of head up displays for CTOL aircraft
N82-30857
MAN POWERED AIRCRAFT
Stability and control of the Gossamer human powered aircraft by analysis and flight test
[NASA-CR-163119] N82-30289
MANAGEMENT PLANNING
A preliminary analysis of TF34-100/400 jet engine removal data in support of the ARP system implementation at NARF Alameda
[AD-A114452] N82-30380
MANEUVERABILITY
Supercritical maneuvering fighter configuration: Wind-tunnel investigation at Mach numbers of 0.60 to 0.95
[NASA-TM-84513] N82-31383
MANUAL CONTROL
Training aircraft design considerations based on the successive organization of perception in manual control
N82-30848
Effects of higher order control systems on aircraft approach and landing longitudinal handling qualities
N82-30848
Evaluation of a trajectory command concept for manual control of carrier approaches and landings
N82-30854
Application of a pilot control strategy identification technique to a joint FAA/NASA ground based simulation of head up displays for CTOL aircraft
N82-30857
Design, simulation and evaluation of advanced display concepts for the F-16 control configured vehicle
N82-30850
MAPS
Analysis and preparation of a digital terrain data base for flight simulator use
[AD-A115567] N82-30315
MARKETING
The sporty game --- on wide body commercial airliner business history
A82-42572
Airbus A 310 will compete with Boeing 767 for market
N82-32380
MARKOV PROCESSES
Analysis of built-in-test accuracy
A82-42211

MEASURING INSTRUMENTS
The Maneuverable Atmospheric Probe (MAP), a remotely piloted vehicle
[AD-A116118] N82-31323
MECHANICAL PROPERTIES
Structural strength of materials and parts of gas turbine engines --- Russian book
A82-42063
Mathematical models of rotor strength and optimization in computer-aided design
A82-42462
MELTING
A survey of melting layer research
[AD-A115224] N82-30806
METAL FATIGUE
A fatigue crack growth theory based on strain energy density factor
A82-43742
METAL MATRIX COMPOSITES
High temperature composites. Status and future directions
[NASA-TM-82929] N82-30336
METEOROLOGICAL PARAMETERS
Meteorological aspects of North Atlantic flight tracks - Some interim results of the study
A82-43250
A survey of melting layer research
[AD-A115224] N82-30806
Evaluation of a meteorological airborne pulse Doppler radar
[PB82-156860] N82-30820
The Maneuverable Atmospheric Probe (MAP), a remotely piloted vehicle
[AD-A116118] N82-31323
METEOROLOGICAL RADAR
Evaluation of the FAA/AITRE weather data device
[AD-A114646] N82-30800
Evaluation of a meteorological airborne pulse Doppler radar
[PB82-156860] N82-30820
METEOROLOGICAL SERVICES
The aviation route forecast /ARF/ program - An interactive system for pilot self-briefing --- of meteorological information
A82-43821
MICROCOMPUTERS
A floating-point/multiple-precision processor for airborne applications
A82-41868
MICROPROCESSORS
Pilot opinions of sampling effects in lateral directional control
N82-30849
Design of a microprocessor-controlled linkage for simulator applications
[AD-A115421] N82-30954
MICROWAVE LANDING SYSTEMS
R & M characteristics of a Microwave Landing System
A82-42216
Operational and functional requirements for the navigation system in terminal areas
[AD-A116127] N82-31318
MIDAIR COLLISIONS
Air-air anticollision systems
[SEE PAPER 811764] A82-44235
MILITARY AIRCRAFT
Northrop ECM - From B-1B to F-5E
A82-43425
It's too logical - It'll never work /Commercial applications of the JVX/
A82-44469
MILITARY HELICOPTERS
Hover jam - US Army studies EW helicopter
A82-41888
MILITARY TECHNOLOGY
R/M/LCC effects of commercial off-the-shelf equipment
A82-42181
Northrop ECM - From B-1B to F-5E
A82-43425
Perspectives for the use of remotely piloted vehicles in military technology
A82-44220
MINIATURE ELECTRONIC EQUIPMENT
A miniature electro-optical air flow sensor
A82-41854
MIRRORS
Wide-angle, multiviewer, infinity display system
[AD-A116308] N82-31336
MISSILE DESIGN
The cruise missile era dawns
A82-43579
MISSILE LAUNCHERS
The cruise missile era dawns
A82-43579
MISSION PLANNING
A field guide for scanner and photographic missions
A82-43468
Automated flight data processing
A82-44222
MODULUS OF ELASTICITY
Stress intensity factors for radial cracks at outer surface of a partially autofrettaged cylinder subjected to internal pressure
[AD-A116396] N82-31714
MOMENTUM
Aerodynamic penalties of heavy rain on a landing aircraft
[NASA-CR-156885] N82-30298
MONITORS
R & M characteristics of a Microwave Landing System
A82-42216
Computer Monitored Inspection Program /CMIP/, a key to increased aircraft and personnel productivity
A82-42217
Multilevel semantic analysis and problem-solving in the flight domain
[NASA-CR-169282] N82-31967
MONTE CARLO METHOD
A method to determine runway capacity
A82-44100
MTBF
Long-range radio NAVAID signal reliability
A82-41951
F/A-18 Hornet reliability challenge - Status report
A82-42229
MULTIENGINE VEHICLES
The Power Pair Locus - A preliminary design aid to select power ratings for multi-engined helicopters
A82-42474
MULTIPLEXING
Data acquisition system for NASA LaRC impact dynamics research facility
[NASA-TM-84510] N82-30525
MULTISPECTRAL BAND SCANNERS
A field guide for scanner and photographic missions
A82-43468

N

NASTRAN
  Large displacements and stability analysis of nonlinear propeller structures
  [NASA-TM-82850] N82-31707
NAVIGATION
  Assessment of stereographics for fire control and navigation in fighter aircraft
  [AD-A115414] N82-30306
NAVSTAR SATELLITES
  FAA acceptance tests on the navigation system using time global positioning system X set receiver
  [DOT/FAA/RD-82/9] N82-31315
NAVY
  Life enhancement of Naval systems through advanced materials
  [AD-A114722] N82-30404
NEAR FIELDS
  Near field analysis of airborne antennas
  [AD-A115074] N82-30462
NETWORK CONTROL
  A new class of routing protocols for a proposed computer network linking tactical radar sites
  A82-43893
NIGHT FLIGHTS (AIRCRAFT)
  Apache to provide night/bad weather capability
  A82-43091
NOISE GENERATORS
  Aerosound from corner flow and flap flow
  [NASA-CR-166396] N82-32081
NOISE INTENSITY
  Airport noise
  N82-31071
NOISE MEASUREMENT
  Summary of airport technology needs
  N82-31073
NOISE POLLUTION
  A study of general aviation community noise impact and annoyance
  [NASA-CR-165945] N82-31066
  Airport/Community Noise
  [NASA-CP-2241] N82-31070
  Community noise
  N82-31072
  Summary of airport technology needs
  N82-31073
  Summary of community technology needs
  N82-31074
  The noise impact of proposed runway alternatives at Craig Airport
  [NASA-TM-84503] N82-32080
NOISE PREDICTION (AIRCRAFT)
  Noise and economic characteristics of an advanced blended supersonic transport concept
  [NASA-TP-2073] N82-31294
  A description of methodologies used in estimation of a A-weighted sound levels for FAA Advisory circular AC-36-3B
  [AD-A116543] N82-32084
NOISE REDUCTION
  Mode scatterer design for fan noise suppression in two-dimensional ducts
  A82-43802
  Airport/Community Noise
  [NASA-CP-2241] N82-31070
  Airport noise
  N82-31071
  Community noise
  N82-31072
  Summary of airport technology needs
  N82-31073
  Summary of community technology needs
  N82-31074
  Rough analysis of installation effects on turboprop noise
  [NASA-TM-82926] N82-32082
NONDESTRUCTIVE TESTS
  Acoustic emission inspection of aircraft engine turbine blades for intergranular corrosion
  A82-41814
  In-flight acoustic emission monitoring
  A82-42865
NONLINEAR SYSTEMS
  Theoretical and experimental investigation of some nonlinear characteristics of electrohydraulic servovalves --- German thesis
  A82-43[illegible]
NONUNIFORM FLOW
  Rough analysis of installation effects on turboprop noise
  [NASA-TM-82926] N82-32082
NOZZLE DESIGN
  Optimal stress surfaces in supersonic three-dimensional flows
  A82-42722
  New nozzle design aimed at F-15, F-16 aircraft
  A82-43093
  Axisymmetric and non-axisymmetric exhaust jet induced effects on a V/STOL vehicle design. Part 3: Experimental technique
  [NASA-CR-166147] N82-31303
NOZZLE GEOMETRY
  Aeropropulsive characteristics of Mach numbers up to 2.2 of axisymmetric and nonaxisymmetric nozzles installed on an F-18 model
  [NASA-TP-2044] N82-30291
NUMERICAL CONTROL
  Programmable controller system for wind tunnel diversion vanes
  A82-41846
  Automated flight data processing
  A82-44232
  The flight management computer
  [SAE PAPER 811762] A82-44233
NUMERICAL FLOW VISUALIZATION
  Turbulence modelling - Report of a Working Party
  A82-42347

O

OIL ADDITIVES
  Determination of antioxidant content in aviation oils using thin-layer chromatography
  A82-42898
  Antioxidants for synthetic oils
  A82-42895
OMEGA NAVIGATION SYSTEM
  Long-range radio NAVAID signal reliability
  A82-41851
  Construction and testing of an Omega navigation system for the balloon-borne X-ray experiment --- German thesis
  A82-43111
  Flight trials of the Litton LTN-211 Omega Navigation System in a Wessex helicopter
  [RAE-TR-RAD-NAV-147] N82-30299
ONBOARD DATA PROCESSING
  Statistical analysis of piloted simulation of real time trajectory optimization algorithms
  A82-43261
  Automated flight data processing
  A82-44232
OPERATING COSTS
  Aircraft R&D in Europe - A perspective view
  A82-41544
OPTICAL RADAR
  Remote sensing of turbine engine gases
  [AD-A115443] N82-[illegible]
OPTICAL TRACKING
  Simulated ILS using a laser tracker
  A82-41795
OPTIMAL CONTROL
  Models for controlling reliability in aviation --- Russian book
  A82-42055
OPTIMIZATION
  Mathematical models of rotor strength and optimization in computer-aided design
  A82-42962
  An optimum design of fuselage structure
  A82-[illegible]
  The application of geometric programming to the structural design of aircraft wings
  A82-42346
  Optimization in multivariable design
  A82-42565
  Sensitivity analysis and optimization of aeroelastic stability
  A82-42106

F

FAGGIANO, P.
Experimental investigation of aeroelastic instability of open field thin profiles
N82-31705

PRESSURE DISTRIBUTION
Flow and pressure field of a model propeller
[NASA-TM-76690] N82-30290
PRESSURE GRADIENTS
Experimental study of turbulence in blade and wall corner region
[NASA-CR-169283] N82-31639
PRODUCT DEVELOPMENT
A survey regarding the German-French development program Alpha Jet
A82-43332
PROJECT PLANNING
A survey regarding the German-French development program Alpha Jet
A82-43332
PROPELLANT ADDITIVES
Antiwear properties of additives based on higher fatty acids --- for jet fuels
A82-42893
PROPELLERS
1980 Conference on Propeller Propulsion, Dayton, OH, April 22-24, 1980, Proceedings. Conference sponsored by AIAA, AHS, SAE, and University of Dayton
A82-42035
Flow and pressure field of a model propeller
[NASA-TM-76690] N82-30290
Large displacements and stability analysis of nonlinear propeller structures
[NASA-TM-82850] N82-31707
Rough analysis of installation effects on turboprop noise
[NASA-TM-82924] N82-32082
PROPULSION SYSTEM PERFORMANCE
1980 Conference on Propeller Propulsion, Dayton, OH, April 22-24, 1980, Proceedings. Conference sponsored by AIAA, AHS, SAE, and University of Dayton
A82-42035
PROTECTORS
A method for designing inlet distortion screens for aircraft gas turbine engine tests using an interactive computer program
[AD-A116508] N82-31325
PULSE DOPPLER RADAR
Evaluation of a meteorological airborne pulse Doppler radar
[PB82-156860] N82-30820

Q

QUALITY CONTROL
Models for controlling reliability in aviation --- Russian book
A82-42055

R

RADAR BEACONS
Fiber optics remoting of terminal radar and beacon signals
[AD-A116402] N82-32140
RADAR MEASUREMENT
Remote sensing of turbine engine gases
[AD-A115403] N82-30310
RADAR TRACKING
Use of aircraft-derived data to assist in ATC tracking systems. I - Accuracy and theoretical considerations
A82-42500
RADAR TRANSMISSION
Hover jam - US Army studies EW helicopter
A82-41088
A new class of routing protocols for a proposed computer network linking tactical radar sites
A82-43953
RADIANCE
Airborne measurements of European sky and terrain radiances
[AD-A114637] N82-30703
RADIO COMMUNICATION
Aircraft radio communications equipment: Design and use --- Russian book
A82-42087
RADIO FREQUENCY HEATING
The interaction of radio frequency electromagnetic fields with atmospheric water droplets and applications to aircraft ice prevention
[NASA-CR-169246] N82-30432
RADIO NAVIGATION
Radionavigation for civil aviation
[SEE PAPER 811750] A82-44231
RADIO PHYSICS
Proposed multipurpose flying radio-physical laboratory using an Il-18 aircraft
A82-43370
RADIO TRANSMISSION
Long-range radio NAVAID signal reliability
A82-41951
RADOMES
The effect of radome scattering on MLS antenna patterns
[AD-A115517] N82-30463
Study of the de-icing properties of the ASDE-3 rotodome
[AD-A115485] N82-31315
RAIN
Aerodynamic penalties of heavy rain on a landing aircraft
[NASA-CR-156885] N82-30296
RAMJET ENGINES
The preparation and characterization of mixtures of polycyclopentadienes as solid ramjet fuels
[AD-A115075] N82-30436
An investigation of the effects of smoke suppressant fuel additives on engine and test cell exhaust gas opacities
[AD-A116171] N82-31548
REAL TIME OPERATION
Evaluation of the FAA/MITRE weather data device
[AD-A114646] N82-30820
Singular perturbation techniques for real time aircraft trajectory optimization and control
[NASA-CR-3597] N82-31330
Real time estimation and prediction of ship motions using Kalman filtering techniques
[NASA-CR-169284] N82-31637
RECEIVERS
FAA acceptance tests on the navigation system using time global positioning system Z set receiver
[DOT/FAA/RD-82/9] N82-31316
RECONNAISSANCE AIRCRAFT
Utilization of AN/APS-94 side-looking airborne radar systems in search and rescue
[AD-A114484] N82-30437
RECOVERY PARACHUTES
Current perspectives on emergency spin-recovery systems
A82-42188
REGULATIONS
Identification of terms to define unconstrained air transportation demands
[NASA-CR-165961] N82-31313
RELIABILITY ANALYSIS
Long-range radio NAVAID signal reliability
A82-41951
R/M/LCC effects of commercial off-the-shelf equipment
A82-42181
Analysis of built-in-test accuracy
A82-42211
Advanced reliability modeling of fault-tolerant computer-based systems

Present challenges of research and technology politics [NASA-TM-76720] N82-31147
Electromechanical Actuation Development Program (EADP). Power control development [AD-A116126] N82-31694

RESIDUAL STRESS
Stress intensity factors for radial cracks at outer surface of a partially autofrettaged cylinder subjected to internal pressure [AD-A116396] N82-31714

REYNOLDS NUMBER
Flow and acoustic properties of low Reynolds number underexpanded supersonic jets [NASA-CR-169257] N82-30288

RIBBON PARACHUTES
Materials and design criteria for Kevlar-29 ribbon parachutes [AD-A116357] N82-31308
Reduction in parachute drag due to forebody wake effects [DE81-030124] N82-31309

ROCKET-BORNE INSTRUMENTS
Control electronics for air-borne quadrupole ion mass spectrometer [AD-A115399] N82-30356

ROLL
Real time estimation and prediction of ship motions using Kàlman filtering techniques [NASA-CR-169284] N82-31637

ROLLERS
Simulation of the interaction between airdrop platforms and aircraft rollers [AD-A116370] N82-31324

ROTARY WING AIRCRAFT
NASA aeronautics [NASA-EP-85] N82-30283

ROTARY WINGS
The Power Pair Locus - A preliminary design aid to select power ratings for multi-engined helicopters A82-42474
Aeroelastic equilibrium of a helicopter rotor in the presence of nonlinear aerodynamic forces [ONERA, TP NO. 1982-33] A82-42809
An examination of helicopter blade profiles and tips [ONERA, TP NO. 1982-35] A82-42811
Boundary layer transducers /BCL/ developed for the study of the flow over helicopter rotor blades [ONERA, TP NO. 1981-93] A82-42817
Laser Doppler anemometry applied to the study of the airflow in the wake of an helicopter rotor [ONERA, TP NO. 1982-61] A82-43755
Aeroelastic analysis for helicopter rotors with blade appended pendulum vibration absorbers. Mathematical derivations and program user's manual [NASA-CR-165896] N82-31298
User's manual for the coupled rotor/airframe vibration analysis graphic package [NASA-CR-165897] N82-31299

ROTATING BODIES
Study of the de-icing properties of the ASDE-3 rotodome [AD-A115445] N82-31335

ROTATING DISKS
The analysis of the thermal-mechanical stress conditions in axisymmetric rotating hot components of /aircraft/ gas turbines --- German thesis A82-41686

ROTOR AERODYNAMICS
Aeroelastic equilibrium of a helicopter rotor in the presence of nonlinear aerodynamic forces [ONERA, TP NO. 1982-33] A82-42809
A doublet lattice method for the determination of rotor induced empennage vibration airloads. Analysis description and program documentation [NASA-CR-165893] N82-31295
Coupled rotor/airframe vibration analysis program manual manual. Volume 1: User's and programmer's instructions [NASA-CR-165891] N82-31965
Coupled rotor/airframe vibration analysis program manual. Volume 2: Sample input and output listings [NASA-CR-165892] N82-31966

ROTOR BLADES
Dynamic System Coupling (DYSCO) program. Volume 1: User's manual [AD-A115003] N82-31974

ROTOR BLADES (TURBOMACHINERY)
A prescribed wake rotor inflow and flow field prediction analysis, user's manual and technical approach [NASA-CR-165894] N82-31296

ROTORS
Aerodynamic forces acting on the blades of stall regulated propeller type windmills [DE82-901178] N82-31718

ROUGHNESS
Aerodynamic penalties of heavy rain on a landing aircraft [NASA-CR-156885] N82-30298

RUNWAYS
Survey and design of airfields --- Russian book A82-43603
A method to determine runway capacity A82-44100
The noise impact of proposed runway alternatives at Craig Airport [NASA-TM-84503] N82-32080

S

SAFETY DEVICES
Improving aircarrier water survival A82-44291

SARSAT
Satellite localization of aircraft accidents - The Sarsat program [SAE PAPER 811765] A82-44239
Consideration of an international private sector satellite search and rescue locating system [IAF PAPER 82-236] A82-44699

SATELLITE DESIGN
Consideration of an international private sector satellite search and rescue locating system
[IAF PAPER 82-236] A82-44699
SATELLITE NETWORKS
Consideration of an international private sector satellite search and rescue locating system
[IAF PAPER 82-236] A82-44699
SEA ROUGHNESS
Real time estimation and prediction of ship motions using Kalman filtering techniques
[NASA-CR-169284] N82-31637
SEALERS
Studies of new perfluoroether elastomeric sealants --- for aircraft fuel tanks
[NASA-CR-166377] N82-30400
SEALS (STOPPERS)
Bonding procedure for Teflon seals
A82-42792
SEARCH RADAR
Utilization of AN/APS-94 side-looking airborne radar systems in search and rescue
[AD-A114484] N82-30437
SEARCHING
Consideration of an international private sector satellite search and rescue locating system
[IAF PAPER 82-236] A82-44699
SECONDARY RADAR
Use of aircraft-derived data to assist in ATC tracking systems. I - Accuracy and theoretical considerations
A82-42504
SEPARATED FLOW
Transient phenomena of shock-induced turbulent separation for a spikebody and stalling airfoil at transonic and supersonic speeds
[AIAA PAPER 82-1362] A82-42950
SEQUENTIAL CONTROL
Programmable controller system for wind tunnel diversion vanes
A82-41846
SERVOCONTROL
Theoretical and experimental investigation of some nonlinear characteristics of electrohydraulic servovalves --- German thesis
A82-43660
SHIPS
Real time estimation and prediction of ship motions using Kalman filtering techniques
[NASA-CR-169284] N82-31637
SHOCK TUNNELS
A laser-interferometer method for determining the forces on a freely-flying model in a shock-tunnel
A82-43311
SIDE-LOOKING RADAR
Utilization of AN/APS-94 side-looking airborne radar systems in search and rescue
[AD-A114484] N82-30437
SIGNAL PROCESSING
Passive aircraft location
A82-42791
Fiber optics remoting of terminal radar and beacon signals
[AD-A116403] N82-32140
SIGNAL TO NOISE RATIOS
Recent results in main beam nulling --- aircraft antenna design
A82-43792
SIGNAL TRANSMISSION
Fiber optics remoting of terminal radar and beacon signals
[AD-A116403] N82-32140
SINGULARITY (MATHEMATICS)
Singularity embedding method in potential flow calculations
[NASA-CR-166387] N82-31300
SITE SELECTION
Survey and design of airfields --- Russian book
A82-43603
SKY BRIGHTNESS
Airborne measurements of European sky and terrain radiances
[AD-A114637] N82-30782
SLENDER WINGS
Sensitivity analysis and optimization of aeroelastic stability
A82-43394
SMOKE ABATEMENT
An investigation of the effects of smoke suppressant fuel additives on engine and test cell exhaust gas opacities
[AD-A116171] N82-31348
SOLAR POWERED AIRCRAFT
Stability and control of the Gossamer human powered aircraft by analysis and flight test
[NASA-CR-163119] N82-30248
SOLID PROPELLANTS
The preparation and characterization of mixtures of polycyclopentadienes as solid ramjet fuels
[AD-A115075] N82-30414
SOUND TRANSMISSION
Noise transmission loss of aircraft panels using acoustic intensity methods
[NASA-TP-2046] N82-31069
SOUND WAVES
Development of a spinning wave heat engine
[NASA-CR-165611] N82-31320
SPACECRAFT CONSTRUCTION MATERIALS
Aerospace applications of composites
A82-42675
SPARE PARTS
A preliminary analysis of TF34-100/400 jet engine rework data in support of the RRP system implementation at NARF Alameda
[AD-A114452] N82-30300
SPECIFICATIONS
Grob aircraft construction: The G 110 flies
[NASA-TM-76893] N82-30303
Helicopter noise definition report UH-60A, S-76, A-109, 206-L
[AD-A116363] N82-32083
SPECTRUM ANALYSIS
The lateral response of an airship to turbulence
[AD-A115197] N82-30312
SPIKES (AERODYNAMIC CONFIGURATIONS)
Transient phenomena of shock-induced turbulent separation for a spikebody and stalling airfoil at transonic and supersonic speeds
[AIAA PAPER 82-1362] A82-42950
SPIN STABILIZATION
Current perspectives on emergency spin-recovery systems
A82-43269
STABILITY AUGMENTATION
Implicit model-following technique - Application to the design of longitudinal stability augmentation systems
A82-43571
STANDARDIZATION
Photointerpretation key for pine regeneration analysis using high-altitude color infrared panoramic photography

SUBSONIC FLOW
Wind tunnel investigations on thin supercritical airfoils in high subsonic flow
[DFVLR-FB-82-06] N82-30296
SUBSONIC WIND TUNNELS
Programmable controller system for wind tunnel diversion vanes
A82-41846
SUPERCRITICAL FLOW
An implicit finite-volume method for solving the euler equations
[ONERA, TP NO. 1982-59] A82-43753
SUPERCRITICAL WINGS
Wind tunnel investigations on thin supercritical airfoils in high subsonic flow
[DFVLR-FB-82-06] N82-30296
Supercritical maneuvering fighter configuration. Wind-tunnel investigation at Mach numbers of 0.60 to 0.95
[NASA-TM-84513] N82-31303
SUPERSONIC AIRCRAFT
A supersonic V/STOL fighter design project
A82-42545
Aerodynamic computational procedures for subsonic and transonic aircraft
A82-43330
Minimum-time three-dimensional turn to a point of supersonic aircraft
A82-44482
Noise and economic characteristics of an advanced blended supersonic transport concept
[NASA-TP-2073] N82-31294
SUPERSONIC FLOW
Optimal stream surfaces in supersonic three-dimensional flows
A82-42722
SUPERSONIC JET FLOW
Flow and acoustic properties of low Reynolds number underexpanded supersonic jets
[NASA-CR-169257] N82-30288
SUPERSONIC SPEEDS
Transient phenomena of shock-induced turbulent separation for a spikebody and stalling airfoil at transonic and supersonic speeds
[AIAA PAPER 82-1362] A82-42950
SUPERSONIC WIND TUNNELS
Calibration and performance of the AEDC/VKF tunnel C, Mach number 4, aerothermal wind tunnel
[AD-A116279] N82-31338
SURVEILLANCE RADAR
Fiber optics remoting of terminal radar and beacon signals
[AD-A116403] N82-32140
SURVIVAL EQUIPMENT
Improving aircarrier water survival
A82-44291
SYSTEM EFFECTIVENESS
Electronic warfare system measure of effectiveness
A82-43040
SYSTEM FAILURES
Maximum likelihood failure detection of aircraft flight control sensors
A82-44481
SYSTEMS ANALYSIS
Economic analysis for data base management
A82-42208
Analysis of built-in-test accuracy
A82-42211
SYSTEMS ENGINEERING
Aeronautical systems technology needs: Escape, rescue and survival, test facilities and test equipment and training/simulation equipment
[AD-A115435] N82-31291
Functional design to support CDTI/DABS flight experiments
[NASA-CR-165947] N82-31326
Wide-angle, multiviewer, infinity display system
[AD-A116308] N82-31336
SYSTEMS INTEGRATION
Integrated sensor system for flight test instrumentation
A82-41869

T

TAKEOFF
Description of a simple model to determine landing gear forces during the takeoff of aerodynamically unstable aircraft
[EX-22B] N82-31333
TARGET ACQUISITION
Statistical analysis of piloted simulation of real time trajectory optimization algorithms
A82-43261
TECHNOLOGICAL FORECASTING
Technology for tomorrow's business aircraft
A82-43577
New approaches to fighter design
A82-44218
New technologies for future fighters
A82-44219

A82-43326
Composite materials: Tomorrow for the day after tomorrow
[NASA-TM-76709] N82-30337
Laminar flow control, 1976 - 1982: A selected annotated bibliography
[NASA-TM-84496] N82-31645

TECHNOLOGY TRANSFER
Present challenges of research and technology politics [NASA-TM-76720] N82-31147

TECHNOLOGY UTILIZATION
Perspectives for the use of remotely piloted vehicles in military technology A82-44220
Present challenges of research and technology politics [NASA-TM-76720] N82-31147

TEFLON (TRADEMARK)
Bonding procedure for Teflon seals A82-42792

TENSILE PROPERTIES
Materials and design criteria for Kevlar-29 ribbon parachutes [AD-A116357] N82-31308

TERMINAL CONFIGURED VEHICLE PROGRAM
Requirements and possible design choices for improving the operation of aircraft in the terminal control area A82-41881

TERMINAL FACILITIES
Repair and maintenance of buildings in civil aviation --- Russian book A82-42059
Survey and design of airfields --- Russian book A82-43603

TERMINOLOGY
Identification of terms to define unconstrained air transportation demands [NASA-CR-165961] N82-31311

TERRAIN
Analysis and preparation of a digital terrain data base for flight simulator use [AD-A115547] N82-30315
Airborne measurements of European sky and terrain radiances [AD-A116637] N82-30782

TEST EQUIPMENT
Fault isolation BITE for increased productivity A82-42210

THERMAL FATIGUE
Structural strength of materials and parts of gas turbine engines --- Russian book A82-42063

THERMISTORS
Boundary layer transducers /DCL/ developed for the study of the flow over helicopter rotor blades [ONERA, TP NO. 1981-93] A82-42817

THERMODYNAMIC PROPERTIES
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 1: Properties in SI units [NASA-TP-1906] N82-32186
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 2: Compositions corresponding to Kelvin temperature schedules in part 1 [NASA-TP-1907] N82-32187
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 3: Properties in US customary units [NASA-TP-1908] N82-32188
Thermodynamic and transport combustion properties of hydrocarbons with air. Part 4: Compositions corresponding to Rankine temperature schedules in part 3 [NASA-TP-1909] N82-32189

THIN AIRFOILS
Wind tunnel investigations on thin supercritical airfoils in high subsonic flow [DFVLR-FB-82-06] N82-30296

THIN LAYER CHROMATOGRAPHY
Determination of antioxidant content in aviation oils using thin-layer chromatography A82-42694

THIN WALLS
Experimental investigation of aeroelastic instability of open field thin profiles --- metallic structures N82-31705

THREE DIMENSIONAL BOUNDARY LAYER
Generation of boundary-conforming grids around wing-body configurations using transfinite interpolation A82-44091

THREE DIMENSIONAL FLOW
Optimal stream surfaces in supersonic three-dimensional flows A82-43712
Higher-order flow angle corrections for three-dimensional wind tunnel wall interference A82-44286

THRUST VECTOR CONTROL
New nozzle design aimed at F-15, F-16 aircraft A82-43092

TILT ROTOR AIRCRAFT
XV-15 program update A82-44461

TIME DISCRIMINATION
Passive aircraft location A82-42791

TIME OPTIMAL CONTROL
Minimum-time three-dimensional turn to a point of supersonic aircraft A82-44482
Optimal periodic Dolphin gliding flight N82-30313

TITANIUM ALLOYS
Titanium surface treatments for adhesive bonding [AD-A114710] N82-30370

TRACKING (POSITION)
Passive aircraft location A82-42791

TRACKING FILTERS
Use of aircraft-derived data to assist in ATC tracking systems. I - Accuracy and theoretical considerations A82-42504

TRAILING EDGES
The design of airfoil profiles with trailing edge loading in transonic flow --- French thesis A82-44224

TRAINING AIRCRAFT
Training aircraft design considerations based on the successive organization of perception in manual control N82-30840

TRAJECTORIES
Evaluation of a trajectory command concept for manual control of carrier approaches and landings N82-30856

TRAJECTORY ANALYSIS
A laser-interferometer method for determining the forces on a freely-flying model in a shock-tunnel A82-43311

TRAJECTORY CONTROL
Singular perturbation techniques for real time aircraft trajectory optimization and control [NASA-CR-3597] N82-31330

TRAJECTORY OPTIMIZATION
Statistical analysis of piloted simulation of real time trajectory optimization algorithms A82-43261
Minimum-time three-dimensional turn to a point of supersonic aircraft A82-44482

TRANSDUCERS
Boundary layer transducers /DCL/ developed for the study of the flow over helicopter rotor blades [ONERA, TP NO. 1981-93] A82-42817

TRANSFER FUNCTIONS
The lateral response of an airship to turbulence [AD-A115197] N82-30312

TRANSMISSION EFFICIENCY
Combined amplitude-phase modulation for a VHF communication link A82-43870

TRANSMISSION LOSS
Noise transmission loss of aircraft panels using acoustic intensity methods [NASA-TP-2046] N82-31069

TRANSOCEANIC FLIGHT
Characteristics of a Paris-New York flight on board the Concorde A82-41700

TRANSONIC FLIGHT
Mediating Mach's mechanics - Bomber away --- weapons delivery of fighter aircraft at transonic speed A82-44467
Supercritical maneuvering fighter configuration. Wind-tunnel investigation at Mach numbers of 0.60 to 0.95 [NASA-TM-84513] N82-31303

TROTTER, D. L.
Evaluation of a meteorological airborne pulse Doppler radar
[PB82-156860] N82-30820
TSAI, M. S.
Mode scatterer design for fan noise suppression in two-dimensional ducts
A82-43402
TURNER, P. H.
Assessment of stereographics for fire control and navigation in fighter aircraft
[AD-A115414] N82-30306
TUTTLE, M. H.
Laminar flow control, 1976 - 1982: A selected annotated bibliography
[NASA-TM-84496] N82-31645

V

VAUCHERET, X.
Corrections for wall effects in ONERA industrial wind tunnels
[ONERA, TP NO. 1982-34] A82-42810
VETTER, J. R.
Problems with the use of percentages in the analysis of AAES data
A82-44293
VICENS, F.
Characteristics of a Paris-New York flight on board the Concorde
A82-41700
VILENKIN, A. V.
Determination of antioxidant content in aviation oils using thin-layer chromatography
A82-42894
VISHNIAKOVA, T. P.
Antiwear properties of additives based on higher fatty acids
A82-42893
VON HEIER, U.
Methodology in flight tests
A82-43400
VISTAVKIN, A. N.
Proposed multipurpose flying radio-physical laboratory using an IL-18 aircraft
A82-43278

W

WALLENBERG, R. A.
Notebook on electromagnetic properties of composite materials below 1 GHz
[AD-A115132] N82-30340
WANG, N.
Near field analysis of airborne antennas
[AD-A115074] N82-30462
WARNER, C.
A new class of routing protocols for a proposed computer network linking tactical radar sites
A82-43893
WELLS, W. R.
Analysis of flight data in the frequency domain
A82-41796
WELTE, D.
Processes and procedural approaches in the aerodynamic design of the Alpha Jet aircraft
A82-43328
WHIPPLE, R. D.
Current perspectives on emergency spin-recovery systems
A82-43264
WHYTE, I.
Wide-angle, multiviewer, infinity display system
[AD-A116308] N82-31336
WIMPENNY, J. C.
Aircraft R&D in Europe - A perspective view
A82-42544
Aeronautical research and development in Europe - Perspectives
A82-43588
WOLF, S. W. D.
Control software for two dimensional airfoil tests using a self-streamlining flexible walled transonic test section
[NASA-CR-165941] N82-30314
WOLOCK, I.
Life enhancement of Naval systems through advanced materials
[AD-A114722] N82-30404
WRIGHT, D. B., JR.
Bonding procedure for Teflon seals
A82-42792

WROBLESKI, J. J., JR.
The lateral response of an airship to turbulence
[AD-A115197] N82-30312

WUENNENBERG, H.
Applied flight mechanics in the design and in flight tests
A82-43327

WYNDLE, G. A.
Computer architecture study for VTXTS simulators
[AD-A115006] N82-30953

Y

YANG, T. Y.
Transonic flutter and response analyses of two 3-degree-of-freedom airfoils
A82-44245

YEE, R.
A floating-point/multiple-precision processor for airborne applications
A82-41868

YOSHIKAWA, K. K.
Transient phenomena of shock-induced turbulent separation for a spikebody and stalling airfoil at transonic and supersonic speeds
[AIAA PAPER 82-1362] A82-42950

Z

ZACHARIAS, G.
Pilot/vehicle model analysis of visual and motion cue requirements in flight simulation
N82-30836

ZAITSEVA, L. S.
Antiwear properties of additives based on higher fatty acids
A82-42893

ZAKHAROVA, T. P.
Structural strength of materials and parts of gas turbine engines
A82-42063

ZARRELLI, L. B.
Analysis of Active BCAS alert rates and protection based on actual aircraft tracks
[AD-A116402] N82-31319

ZARZAR, V. A.
Extracts from Problems of Air Law, a collection of works of the Section of air law of the Aviakhim Society of the USSR and Aviakhim RSFSR
[NASA-TM-76913] N82-31153

ZEFF, A. W.
Wide-angle, multiviewer, infinity display system
[AD-A116308] N82-31336

ZHESTOVSKII, V. V.
Mathematical models of rotor strength and optimization in computer-aided design
A82-42462

ZINN, B. T.
Development of a spinning wave heat engine
[NASA-CR-165611] N82-31328

ZUGSCHWERT, J. F.
It's too logical - It'll never work /Commercial applications of the JVX/
A82-44469

1. Report No. NASA SP-7037(155)	2. Government Accession No.		3. Recipient's Catalog No.
4. Title and Subtitle Aeronautical Engineering A Continuing Bibliography (Supplement 155)			5. Report Date December 1982
			6. Performing Organization Code
7. Author(s)			8. Performing Organization Report No.
			10. Work Unit No.
9. Performing Organization Name and Address National Aeronautics and Space Administration Washington, D.C. 20546			11. Contract or Grant No.
			13. Type of Report and Period Covered
12. Sponsoring Agency Name and Address			14. Sponsoring Agency Code
15. Supplementary Notes			
16. Abstract This bibliography lists 272 reports, articles and other documents introduced into the NASA scientific and technical information system in November 1982.			
17. Key Words (Suggested by Author(s)) Aerodynamics Aeronautical Engineering Aeronautics Bibliographies		18. Distribution Statement Unclassified - Unlimited	
19. Security Classif. (of this report) Unclassified	20. Security Classif. (of this page) Unclassified	21. No. of Pages 68	22. Price* $5.00 HC

*For sale by the National Technical Information Service, Springfield, Virginia 22161
